## BODY AND MIND, OR, THE DATA OF MORAL PHYSIOLOGY.

BY FELIX L. OSWALD, M. D.

Part I.

### INTRODUCTION.

Among the nations of the East, tradition has preserved the memory of a flood so destructive that the present world hesitates to credit the record of its devastations. The time may come when our children will find it equally difficult to realize the horrors of the moral cataclysm which for nearly fifteen hundred years submerged the homes of the Caucasian race with a deluge of madness and superstition.

The highlands of science have emerged from that flood, but the foot-hills are still covered with the wrecks of a former civilization; the sediment of prejudice still attests the high-water marks of mental degeneration, and the present age can bear witness to the emotions of mingled doubt and delight at the appearance of an arc of promise in the form of a religion of science. The first gleam of that sunburst has long cheered the friends of light with the hope of an ultimate victory over the powers of darkness. For more than two hundred years the delusions of anti-naturalism and its utter inefficiency for the regeneration of mankind, have become more and more evident to all independent thinkers. They could not fail to perceive that the precepts of a world-despising Messiah were a fatal obstacle to the material progress of mankind. They could not ignore the fact that the systematic suppression of secular science had avenged itself by a far-gone marasmus of intellectual decrepitude. They could not ignore the evidences of physical degeneration, induced by the utter neglect of that health-culture that had for ages sustained the prestige of pagan civilization. The authority of Jesuitism rested almost entirely upon the alleged moral value of its tenets, a claim sadly at variance with the evidence of practical experience, but still tacitly accepted by a generation inculcated with the dogma of natural depravity. The apostles of science, however, have begun to question both the premises and the inference of that doctrine, and the last support of the mediæval delusion will hopelessly collapse as soon as a plurality of its victims shall realize the fact that the gospel of anti-naturalism is the most *immoral*, as well as the most mind-ennervating and health-blighting of all known supersti-

tions. The depreciation of physical education opened the door to effeminacy and all its concomitant vices. The suppression of healthier pastimes became a direct cause of intemperance and sexual aberrations. The encouragement of mendicancy and procrastination undermined the moral basis of industry. The doctrine of passive submission to injustice became a main-stay of despotism. The instinct of truth was crushed out by the dogma of salvation by unreasoning faith. The promptings of humanity were suppressed by the dogma of eternal punishment, and the alleged sinfulness of our natural affections. The instinct of justice was perverted by the dogma of predestination.

But the most fruitful cause of the moral degeneration that made the era of monasteries the darkest page in the history of mankind was, after all, the total neglect of physical science, especially of that branch of physiology which teaches the manifold

### INTERACTION OF BODY AND MIND.

The dualism of ancient moralists proved for centuries a root of baneful delusions. The Brahmins, the priests of Egypt, and many Gnostic philosophers, as well as the seers and prophets of Islam, considered the "soul" a mere guest of the body, a heterogeneous entity apt to survive the decay of its earthly tabernacle. They believed in the existence of a spirit-world extraneous to material creation and often neglected the revelations of nature in their effort to fathom the mysteries of ghost-land.

But the apostles of anti-naturalism went further. Their moral cosmogony makes the body the enemy of the soul and systematically contrasts the interests of earth and the "Kingdom of Heaven." In the language of asceticism the "world" and the "flesh" are synonyms of sin; the suppression of our natural instincts is persistently inculcated as a primary condition of salvation; the abasement of the body is distinctly enjoined as the best means of securing the promotion of spiritual welfare. The *anti-physical* principle of the New Testament is, indeed, the key to the enigma of the most monstrous aberrations of mediæval theology, and the keystone of a world-redeeming religion of science should be the truth that the highest moral and the highest physical welfare of mankind can be only conjointly attained.

The empirical knowledge of that fact has at last been bought at a price which the world cannot afford to pay

a second time. The unnatural restraint of convent-life resulted in such hideous nightmares of hysterical superstition that their memory still haunts the dreams of the Caucasian nation like the after-effect of a brain fever. The alcoholic excesses of the mediæval priesthood avenged themselves in a depth of intellectual abasement that made the name of a monk a by-word among the temperate nations of Islam. The inhuman oppression of the bondsmen enslaved by the system of clerical feudalism bore its fruit in the butcheries of the Peasants' War and the French Revolution, and ripens an aftermath in the doctrines of Anarchism and Nihilism. The moralists that ranted about the golden streets of the New Jerusalem permitted their own towns to reek with filth till the "immortal souls," as well as the despised bodies of their dupes were assailed by appalling epidemics—plagues, encouraging manias, dancing manias, contortion-fits and manias of suicide. For centuries the insane suppression of physical recreation on the day when a vast plurality of workingmen find their only chance of leisure has driven millions to drown their misery in the Lethe of intoxication, and thus, by the direct influence of fanatical anti-naturalism, produced the very evils which the exponents of that creed denounce as the result of natural depravity.

For the strictest followers of a Nature-hating Messiah, the pagan ideal of a "healthy mind in a healthy body," has, indeed, been perverted into the paragon of a world-renouncing soul in a crushed body; but even for the millions who modified that extreme of infatuation with some alloy of practical secularism, the imaginary antagonism of body and soul remained, and still remains, a source of baneful misconceptions. The science of the thousand fold *moral effects of physical causes* is still a sealed book to a large plurality of our fellow-men, and it is curiously characteristic of the anti-physical bias of their hereditary ethics, that at the same time they are ready, not only to admit, but to exaggerate, the *physical effects of moral causes*. A semi-conscious tendency of their mental constitution inclines them to emphasize the influence of the "immaterial soul" on the despised, earth-begotten body, and to deny, or ignore, the evidences of a reflex-influence. The revivalists of mediæval phantasms surfeit us with their accounts of miraculous cures effected by the "Christian faith" of the patient. Our mesmerian miracle-mongers expatiate upon the physical transformations induced by the mere volition of the *magnetiseur*. The metamorphoses of the Ovidian fairy-tales are rivaled by the portents of mediæval church-legends. At the mere prayer of an orthodox saint blind men regain their sight, cripples their lost limbs, beldames their lost youth; consumptives are resurrected from their beds of disease, and even corpses from their tombs. Thousands of scrofulous natives of mediæval England hoped to cure their ailments by the

benediction of the lawfully anointed sovereign, and a modern King of Spain endeavored to remedy the barrenness of his nuptial couch by embroidering a petticoat for an image of the Holy Virgin. Spanish strategists even attempted to compensate the inefficiency of their marines by baptizing their line-of-battle ships with fulsome-saintly names. The dogmatists of our Southern swamp-States still include protracted prayer-meetings among the specifics for the cure of climatic fevers, though in less fervid latitudes the therapeutic use of homilies seems to be limited to their substitution for the soporifics of the drug market. The sinfulness of free inquiry is still illustrated by numerous anecdotes commemorating the fate of unbelievers struck dumb in the act of abusing their organs of speech to the detriment of clerical interests.

The moral effects of physiological predispositions, on the other hand, are strangely underrated. Of a thousand splenetics who bemoan the vanity of earthly existence, perhaps not a dozen suspect that their pessimism could be cured by a slight change of diet. The carnivorous missionary who preaches the gospel of meekness to an assembly of Hindoo peasants, hardly dreams that the vegetarianism of his hearers more than compensates the lack of dogmatism. The pious father who hopes to protect his boys from worldly temptations by robbing them of their holiday sports, would be amazed to learn that his very asceticism is apt to increase the danger of secret vices, as naturally as the exclusion of fresh air increases the peril of dry-rot. The moral bias of race influences has hardly begun to be recognized in the theories of our international reformers; and men who would laugh at the idea of raising a young hyena for watch-dog purposes, nevertheless hope to cure the savage propensities of a young Hottentot by prayers and Sunday-school text-books. They would not waste their time in trying to gather figs from thorns, yet devote years to the attempt of appealing to the sentimental instincts of men who have been starved into chronic rancor, and who by ages of oppression and imposture have been taught to assume the defensive armor of universal mistrust. The moral influence of climate is an agency equally unknown to the moralists who preach continence on the Senegal and frugality on the banks of the Neva, and who berate the natives of the Arctic snow-wastes for their lack of Arcadian trust of the bounty of Providence. Nor has their philosophy ever recognized the intuitive contrasts of youth and old age. "After seeing his children and children's children," says the law of Menu, "a world-weary man shall retire to the peace of solitude, and devote the end of his life to contemplation and daily communion with the spirit of Brahma." But our spiritual task-masters attempt to enforce the instincts of decrepitude upon the mind of earth-loving youth; they darken the morning hours of life with the gloom of

night; the ministers of Quietism gather dead leaves to smother the budding flowers.

But the most neglected branch of moral physiology is certainly the study of the moral and mental effects of pathological tendencies. The contrasts of the psychic phenomena in health and disease have no place in the science of our moral philosophers; the traditional prejudice of dualism seems to shrink from the recognition of the striking analogies of moral and physical changes under the influence of abnormal conditions. The opponents of Monism are loath to admit that the functions of the "immortal soul" can be modified by sanitary arrangements, that its vigor declines with the vigor of the body, that many of its special faculties can be stimulated or annihilated by surgical operations; that every modification of physiological conditions is accompanied by a corresponding change in the disposition of the "immaterial spirit." The vice-begetting tendency of suppressed physical instincts is still obstinately ignored. The influence of abnormal habits on the vigor of volition, on the principles of self-respect, of benevolence, and even of integrity, are unknown factors in the diagnosis of our moral quacks.

Our entire system of moral education needs, indeed, a thorough revision, and the success of urgent social and ethical reforms depends on the radical reconstruction of moral philosophy on a basis of natural science.

#### THE IMPORTANCE OF THE LOWER COURTS.\*

BY JOSEPH W. ERRANT.

People of to-day are very much worried about the higher courts, although that system of courts in which the mass of the people meet the law and become acquainted with its practical administration are—to say the least—of no less significance. I dislike to use the term lower or lowest courts. To me one court is as important as another, and if any distinction is to be made, it should be in favor of those so-called lowest courts. It all depends from what standpoint we view the matter. The standard to-day is largely the money standard, and the importance of a court seems to be measured by the amount in dollars and cents over which the court has jurisdiction. If we could but realize that a claim for \$10 sometimes involves more of human justice than a claim for \$100,000 our views might possibly change. To-day questions concerning property and property rights occupy men's minds. When will they allow questions of right and justice to men and women to enter into their considerations? In the turmoil of a wonderful material development, we have thought too little of such questions. Only a month ago, in an address before the

Alabama State Bar Association, Judge Dillon gave statistics to show that nearly one-half of the modern reported cases involved corporation law.

It therefore becomes important to consider that system of courts, in which the people gain their impressions of justice practically applied.

Let us then consider the justice of the peace system of courts. In Chicago we have also a system of police courts, in which are heard cases brought in by the police. Cases involving violations of local ordinances are heard in these courts. Justices of the peace are usually elective officers. In Chicago we have a round-about method by which the judges of the courts of record recommend names to the Governor, and the Governor by and with the advice and consent of the Senate appoints. Certain justices named by the Mayor and approved by the common council are appointed to preside in the police courts. For the services there rendered the city pays them a regular salary. They do not, however, devote themselves exclusively to the police courts. They carry on their private justice of the peace business besides.

The law does not require a justice of the peace to possess any special qualifications for the position, nor is it necessary that he should be a man who is versed in the law. If he has any qualifications, or if he is a lawyer, this is simply accidental. Indeed, in the eyes of the profession a lawyer who accepts the office of justice of the peace is considered to have lowered himself. This sentiment is not at all creditable to the profession, for by it men who would honor it are prevented from accepting the office. In fact, such a feeling toward the position of a justice of the peace is an injustice to those men who accept these positions and endeavor to do their duty conscientiously. If things do not go right, it is often because the system makes them its unwilling victims.

As soon as the justice has received his commission, he rents and furnishes a room, hires a clerk, hangs out his sign and announces himself as ready for business. If he is his own successor or if he can rent the room of his predecessor in office he is spared some of the preliminary work. He must pay all his expenses and make a living besides. He has no fixed income. He is absolutely dependent upon his fees. It is hard to imagine a system better calculated to destroy every idea of judicial dignity or independence.

A system is wrong which allows Blank, Brown and Jones to enter into a scramble for a judicial office, in which scramble it is often merely a question of political influence as to who obtains the office. A system which compels a man to work to obtain a judicial position and to work to retain it is wrong. There is a fierce strife for the position of justice of the peace in Chicago. Every manner of influence is used to retain positions or to crowd out present incumbents. Such a system induces

\*The above essay is an abstract of an address entitled "Justice for the Friendless and the Poor," which was delivered before the Illinois State Bar Association, January 11th and before the Society of Ethical Culture at Chicago, January 20th, 1888. As a result of the above mentioned address a movement has been started and is already well under way to organize a bureau of justice in Chicago. As soon as possible an office will be opened in which "the Friendless and the Poor" will gratuitously be advised and helped to obtain justice.

schemes and combinations which are demoralizing to any judicial system. A system of courts in which the services of the judges are paid for by the fees which they receive is wrong. The astounding spectacle is presented of a judge asking for patronage. Some of the justices have a large patronage—others have a small patronage. There is a direct inducement offered to men to attempt to obtain business in some way or other. Influences are used and promises are made. Every favor done him places the justice under obligations to some one.

It has occurred to me that we might adopt the idea of the "district courts" of New York City. The jurisdiction could be raised above that of the present justice of the peace courts and could be extended in other directions. In this way the circuit and superior courts could be relieved. The judicial tribunals of this State will never possess the dignity or command the confidence which they should until all our judges are appointed during good behavior. There should be a chance for a judicial career just as there is for any other. But whatever plan may be adopted, remember that that system of so-called lower courts is just as important as any other. Place there men of wide knowledge, human sympathy and special training. Upon the respect felt toward the so-called lower courts depends the respect felt toward the whole judicial structure.

With an improved system of courts must come a different order of officials to do the work of those courts. The present constable system is a disgracefully irresponsible system. Nominated at the end of the proceedings of a town convention, when most of the delegates have gone home, almost any one can have his name placed upon the ticket. Very few know or care to know who the men are. I should be in favor of electing a chief constable. I should hold him responsible and allow him to appoint his assistants. Either this, or I should be in favor of enlarging the sheriff's duties.

But there are other questions to be considered. Let us, for instance, suppose the case of a poor girl who has been discharged from employment by a man who has not paid her wages for several weeks. He feels that the poor girl will not be able to compel him to pay and he can pocket the wages. There are men who underbid competitors in business, employ help and think to make up the difference in this way. There are dressmakers who employ girls for a number of weeks, and then send them away, refusing to pay wages on the ground that the girls' work was poor. There are fashionably-dressed ladies who do not pay a poor dressmaker, and the poor dressmaker cannot spend the time which must be devoted to her work in collecting or suing for her hard-earned money. But let us return to the case of our poor girl. She goes to see the man several times, but he refuses to pay. In some way or

other she finds her way to the office of a justice of the peace. She enters a room. The justice may be at leisure or he may be occupied in the trial of a suit. She is not helped either way. There are other men in the room, a clerk, constables, so-called attorneys, etc. She speaks to one of them; he may be the justice, the clerk, a constable, or one of the numerous "shysters" who hang about every justice's court-room. It is all a matter of accident. She tells her story. She has no money. The justice may enter her suit without fee; he may not. She does not know where to obtain two dollars. She goes away discouraged. She may have fallen into the hands of some shark, who agrees to begin suit for her, because he has an agreement with the justice by virtue of which the justice only receives a fee in case he gives judgment for the plaintiff. Suppose she obtains judgment. The execution is placed in the hands of a constable who may collect the money, or he may be paid by the defendant to wait. At last the money is collected. The so-called attorney retains almost all for his services. The remainder is handed over to her. Sick at heart on contemplating the result of all her trouble, she resolves never to enter a court-room again. She cannot understand the ways of justice. She had an idea that all that was necessary was to tell the judge and he would soon have the money for her. But she found out that she had to come several times, that she had to wait for an hour or two about the court-room, that she had to wait twenty days after judgment was entered before an execution could be issued; that she had to wait many weeks before the money was collected, and at last when it comes to her it is a third or fourth of the original amount. Or suppose the employer appeals, and thus postpones action for a year or more, as in Chicago, what is she to do? While all this has been going on she has fallen behind in her rent. She may have found a new situation at once. Perhaps she has not. If the employer had paid the wages due her she could have lived thereon several weeks. Now she is compelled to seek charity or worse. Suppose the employer sees fit to fight the case. He engages an attorney, who endeavors to secure numerous continuances in order to weary the plaintiff. If she is alone, she soon succumbs. If she has an attorney, she may be pressed by him to settle, for he feels that there is very little money in the case for him; he wants what he can get now; he does not wish to see the case appealed.

This is no fancy picture. I could go on and give you case after case; in which men and women have the same or similar experiences, in their search for justice. Hundreds, perhaps thousands, of people have heard of the experiences of others and carry their wrongs in their breasts, believing that they cannot obtain justice. They have lost confidence in the law and its administration and will not even attempt to secure justice. The case

above detailed is a case involving a small claim. I have shown you what the collection of such a claim means to the poor and friendless. There may be cases involving property, reputation or grievous wrong. To ask people to engage an attorney or pay costs when they have no money, to ask them to follow up a case by themselves when they have not the slightest idea as to what they shall do or where they shall go, to allow them in their search for justice to fall into the hands of the unscrupulous, when it can be prevented—all this is a practical denial of justice. To tell people that a case has been continued or appealed without any further explanation, when they never heard the words used in that way, is a farce, and yet that is all the satisfaction people sometimes obtain. They do not like to ask many questions. They are rather timid in a court-room. They go away without understanding what is to be done. Many people are fearful and nervous about entering a court-room. They have heard of lawyers' cross-examinations and other things and, rather than submit themselves to such treatment, they forego a right or suffer a wrong.

As to the higher civil courts, they are almost an unknown land to the poor and friendless. Appealed cases they are compelled to abandon. Suits within the jurisdiction of the higher courts, they have no means to bring. Now and then a damage suit brought by some poor person on an agreement with an attorney for one-half or one-third of the proceeds finds its way into our higher courts. Unless they are entered on such terms, the higher courts are practically closed to the poor and the friendless.

The justices of the peace in their capacity of examining magistrates have many criminal cases brought before them. I shall not have time to consider that branch of the subject, nor is it necessary. Let us suppose the case of a poor man whose house has been entered, and whose hard-earned savings have been stolen. He finds his way to a police station and makes complaint. A warrant is issued, the guilty parties arrested and brought into court. A day is set for the hearing; the complaining witness is told to come with his witnesses; he comes, but on some point or other the hearing is continued. Again he comes; again the case is continued. Finally the hearing takes place, and the defendant is bound over to the grand jury. After some time the complaining witness is notified to appear before the grand jury. He has already lost many days' wages, and his witnesses begin to object. Perhaps he has been paying them the wages which they were compelled to lose through absence. Perhaps he himself, or some one of his witnesses, has lost a situation through absence. It may be that he gives up the case at this point. We will suppose that he goes on. He and his witnesses appear, the case will not be heard to-day but to-morrow. Again they come. The accused is indicted. Some

weeks pass and then the poor wage-worker is notified that the trial is to take place on such a day. He appears with his witnesses and has to wait until the case is called for trial. He may have to wait for several days. At last the trial is over. The wrong-doer has paid the penalty. The law has been vindicated, but at what cost to the wage-worker who can ill afford to lose a single day's wages.

The poor and friendless defendant who is brought into the police court with the strong hand of the policeman upon him and with no friend or attorney at his side is in a sad plight indeed. He is usually hurried off to the bridewell or the jail. It is simply astounding to think of the injustice which is being done under the system of to-day. The last grand jury in Cook county reported thirty-nine true bills and seventy-four no bills. A large number of the persons covered by the seventy-four no bills had probably been spending a month or two in the jail awaiting the action of the grand jury.

The highest reform idea of the average police official of to-day is to arrest a person and place him behind the bars. This is his panacea. I could tell you of cases in which police officials have been astonished that any other course should be suggested. All their investigations are conducted with an eye to the accomplishment of their purpose. As a general thing, such investigation is the only guide the justice has, and hence he becomes the victim of the present methods. The police officials must be taught differently. Our police officers, and certainly the higher officials, should be selected with a special eye to their fitness, their judgment, their powers of discrimination; with such men to support him, the examining judge could better perform his duties.

In the good old days of the New England colony the people were accustomed to come together and consult about the public welfare. Their affairs were of a most simple character, and Smith and Brown and Jones could easily attend to the duties assigned to them without neglecting their own business. A century and more has passed away, and the town-meeting idea of government still survives. Brown, Smith and Jones are still deemed capable of stepping from their various pursuits into positions requiring adaptation and training. It is time for us to realize that such a state of things cannot continue. The methods adapted to the wants of the New England village will not answer for the populous cities and States of to-day. At the suggestion of civil service reform the American citizen sees before him the picture of an aristocracy of office-holders. I believe in civil service reform from the bottom to the top. It is the survival of antiquated methods of providing ourselves with public officers which has raised about us tyrannies more damnable than any which can possibly come from the establishment of our public offices on a different basis. I refer to that curse of our day—polit-

ical influence. The system of to-day, with its many elective offices and short terms of service, tempts men in public position to conciliate this interest or that, to beware of offending this man or that, to listen to the commands of this political leader or that. Men cannot call their souls their own. This political influence meets you everywhere. It makes the wheels of justice go fast or slow, or not at all. It opens doors as by magic, or keeps them closed. It sits with the prosecutor in the court-room or visits him in his private office. It commands the judge on the bench. When will the American people do away with the system which has cursed us too long? You, who are on the outside, sometimes wonder at this or that failure of justice, at this or that persecution. These things are brought about by influence. You yourselves are equally responsible with the men who are using the system for their own purposes. It is your privilege to reject or retain it. The poor and the friendless have no influence.

Do not believe that it is simply a question of the poor and the friendless against the rich and the influential. It is also a question of the poor and the friendless against the wicked, the cunning, the dishonest and the unscrupulous, not in one class, but all through the social structure.

It is then necessary for those who would stand for justice to stand for it against injustice, wherever it may be found. They should feel with Theodore Parker:

"Give me the power to labor for mankind,  
Make me the mouth of such as cannot speak;  
Eyes let me be, to groping men and blind,  
A conscience to the base, and to the weak  
Let me be hands and feet; and to the foolish, mind.

Who will take up the work of creating conditions by which the poor and friendless will be able to contend on equal terms with those who have wronged them? These matters must not be left to chance. It is dangerous to do so. It must be the business of some one to see that these things are done.

The State is now giving its money and protection to institutions which pretend to cure existing maladies. The day will come when it will prefer to give its support to those causes which endeavor to prevent diseased conditions.

## THE COPE-MONTGOMERY DISCUSSION.

### I.—THE THEISM OF EVOLUTION.

BY E. D. COPE.

The following is offered as a synopsis of the leading opinions maintained by the writer in a series of articles furnished by him to THE OPEN COURT during 1887, in reply to articles written by Dr. Edmund Montgomery.

#### I. PRINCIPIA.

1. In the universe there exist both mind and matter, subject and object.

2. The evidence for the existence of mind is found in consciousness; first, of ourselves, and second, of other living beings, whose motions, identical with those which we make under the influence of our own consciousness, convince us of their possession of it.

3. The evidence for the existence of matter is found in certain modifications experienced by our consciousness, especially in the sensations of extension and resistance.

4. Since consciousness does not exist apart from the motion of matter, we regard it as a property of the matter in motion, that is, as a property of energy.

#### II. FACTA.

1. The gross activity of consciousness is immediately conditioned by matter.

2. In certain of its thought-forms consciousness is not immediately conditioned by matter, but only by its past experience of matter.

3. The forms of consciousness mentioned under (2) control the direction of energy, and hence the use of matter.

4. The proof of (3) is seen in the designed movements of animals in which they direct a current of energy in order to produce a result more or less exactly adapted to satisfy the conditions demanded by a sensation.

5. As soon as a designed movement has been fully acquired, that is, so soon as the animal mechanism necessary for its production has been created, it is performed without consciousness of effort, and may be performed unconsciously, or even in a state of general unconsciousness. Therefore designed automatic acts originated in consciousness.

6. Evolution of organic types is the resultant of the interaction of subject and object, or the living organism and its environments.

7. The function of the organism *in evolution* is to produce variations in its structure as an effect of its motions.

8. The function of the environment in evolution is to destroy the organism, or to restrain, permit or encourage its use; that is, to exercise natural selection.

9. The effect of this interaction, where the movements of the organism are stimulated, is to produce specialized structures and types out of generalized ones. Where the action of the organism is not stimulated, the result is to produce degenerate types.

10. It follows that organic evolution is the result, mediate or immediate, of consciousness; that is, of the interaction of conscious energy or its residua, the organic vital energies, in interaction with the environment.

11. Organic energies perform chemical syntheses and analyses, demonstrating the control of vital over chemical energy.

12. Whereas physical and chemical energies dis-

play only as results dissipation of energy and integration of matter, the energy of evolution displays complication of matter for the profitable direction and storage of energy.

### III. CONCLUSIONS.

1. The function of control and construction displayed by the energy of evolution (hathmism) leads us to infer that this type of energy can control its conditions sufficiently to enable it to have a wide distribution in space and time in the universe.

2. Since the originating and controlling element of this *special* type of energy is consciousness, it is inferred that consciousness has existed prior to any given *special* inorganic type of energy.

3. As the condition of consciousness is the unspecialized or uncreated condition of energy, it is inferred that consciousness is a property of matter in an unspecialized or generalized condition in some respect.

4. Since protoplasm is not in all respects the most generalized conceivable condition of matter, it is inferred that there are physical bases of consciousness other than protoplasm.

5. It is inferred from the preceding considerations that the existence of primitive consciousness in primitive forms of matter is not only possible but probable, and this consciousness constitutes a primitive person or Deity.

### II.—EPITOME OF MY CRITICISM OF PROFESSOR COPE'S THEOLOGY OF EVOLUTION.

BY EDMUND MONTGOMERY

I will endeavor to comply with the request of the president and the editor to give the gist of my controversy with Professor Cope in about a column.

Professor Cope maintains that mind is the active agent in the organization of living beings. I maintain, on the contrary, that the mind of living beings is itself only a product or outcome of their organization.

Professor Cope's view leads him to assume as original building-material an entirely "unspecialized" kind of matter, and as builder or organizer a supreme mind or Deity inherent in such matter.

In this connection I had to point out the great dilemma of modern philosophy; the impossibility, namely, of conceiving anything mental imparting motion or direction to anything material. Leading thinkers of almost every school, when seriously contemplating the apparent occurrence of an intercommunication between mind and matter, have declared it scientifically impossible and philosophically inconceivable. Yet, Professor Cope's entire theory of organization through mental agency rests on the flat assertion of its being a self-evident proposition, that our mind moves our body.

I further pointed out that to escape from this distracting dilemma of having on the one side a mind incapable of *naturally* acting upon matter, and on the other side

matter incapable of *naturally* acting upon mind—that to escape this dead-lock in the way of a unitary or monistic conception of nature, a theory of cognition is indispensable.

By help of such a theory we become irrefragably aware that matter and motion are only perceptual signs within our own consciousness of the presence of a non-mental existent and its activity, which are stimulating our senses in specific ways. We can be certain that what thus affects our senses is really *non-mental* in its nature; for nothing mental has power to affect our senses and to awaken specific percepts in us. This non-mental existent and its activity cannot possibly, in the remotest degree, resemble their perceptual representation in us; for how can anything non-mental resemble anything mental? Therefore, they are not in themselves what we perceptually know as matter and motion. And thus the conception of mind moving matter becomes at once irrelevant. The dualistic opposition of matter and mind is seen to be superficial, and only due to inadequate conception on our part.

These truths, yielded by the theory of cognition, I have used to explain our voluntary movements, upon which movements the entire question of the influence of our "mind" on our body actually centers.

Our veritable being has power so to affect the sensibility of an observer as to arouse its perceptual representation in him. This perception of the observer, in all its details, forms clearly part of his own consciousness; but it representatively corresponds to the characteristics of the non-mental existent, which is stimulating his senses.

Now, it is evidently the *transient activity or function* of that part of the *permanent living being* which we perceive as his nerve-system that yields to him all his conscious states.

While this functional play of inner awareness is taking place in the observed organism, the observer himself perceives nothing but motion; motion of molecules in the nerve-system, and dependent movements of peripheral parts of the organism, such as features and limbs.

"Mind" or consciousness is thus a functional outcome of the organization of living beings, and its development is found to keep strict pace with the progressive organization of living forms.

### NOTE.

The only comment which I have to make on Dr. Montgomery's argument is this: That while denying that consciousness can control energy (matter), he admits that matter controls consciousness. These two positions are logically inconsistent. If the affirmative is true of consciousness it is true of matter, and *vice versa*. On other points I can agree fully with Dr. Montgomery.

E. D. COPE.

## NATIONAL TAXATION.

BY AN ANTI-MONOPOLIST.

The United States of America is a free and independent country, where the State does not mean anything outside of or superior to the citizens forming the same, but a mere compact of the latter for their mutual protection in the full and unabridged enjoyment of all their natural, inherent and inalienable rights. In such a country, where the people govern themselves by laws and principles adopted by them, and where all the public officers of the legislative, executive and judicial branches of the government are not rulers but servants of the people, public life should be as pure as private life, public affairs should be conducted as truthfully as private affairs, and politics should be strictly moral.

With the sanction of our American Constitution, the United States was afflicted with the institution of negro slavery, up to our late civil war, caused by it, but in return causing the abolition of that fiendish institution in this free country. Utterly incongruous with justice, liberty and humanity, negro slavery, while it existed in the United States, was in reality or practically a monopoly in favor of the slave-holders and at the expense of the slaves. A monopoly means an unjust privilege of a monetary character for the benefit of some men and at the expense of others. The former slave-holders of this country had the right to buy and sell their slaves as chattels and not to pay them any wages for their work; while the former slaves of this country were deprived of liberty, of the right of property on their own persons, of the right of receiving wages for their labor, of the right of being educated, and of the right of founding homes and families. Our American civil war has clearly shown what ruinous things monopolies are to a free country.

The United States is now afflicted with monopolies based upon and being fostered by our American *protective tariff*. By such a tariff duties are meant, our national government levies on foreign imported goods, not only for its own support and for the payment of our public debt, but also for the so-called protection of our American industry, chiefly of the mechanic and manufacturing kind. Such a tariff, enhancing the prices of foreign imported goods, enables American producers and manufacturers to sell their own goods of the same sort dearer than they could do otherwise, and compels the people generally to pay higher prices for such goods, foreign or domestic, than they would have to pay for them without such a tariff. Under the fundamental laws of this country, the Declaration of Independence and the Constitution of the United States, our national government has no business to lend its hand to such a trick, profitable to certain classes of men, but detrimental to the American people as a whole. In fact, under the fundamental laws referred to, our national govern-

ment has no right to raise revenue for any other purpose than for its own support and for meeting its legitimate obligations.

American mechanic and manufacturing industry, by the good qualities and cheap prices of its products, should protect itself, both at home and abroad, against the competition of foreign industry. The American people, what they need of manufactured goods, should, by all means, produce themselves, as far as the natural resources of this country enable them to do so. There are heads and hands enough in the United States for such a purpose. Both self-respect and economy should cause the people of this country, financially, industrially and commercially to emancipate themselves from Europe and the rest of the globe as soon as possible.

American mechanic and manufacturing industry should have for its products not only a home market, but as extensive as possible a market in foreign countries, too, just as our American agriculture has it for its products. Thus, useful employment would be permanently given to a great many men in this country. But this is prevented, at present, by our protective tariff, rendering American goods too dear for consumers abroad.

Commerce is a cosmopolitan institution, and nations, like the American people, obstructing its paths to their own fabrics by too high prices of the same, hurt themselves in their material welfare. Are the artisans and mechanics among the American people less intelligent, less ingenious, or less industrious than those of other nations? Not at all! Cheaper prices of American manufactured goods and a larger and readier sale of the same, both at home and abroad, could and would only favorably affect the prosperity of this country.

A protective tariff should protect the home industry of this country by enhancing the prices of domestic goods and thus the wages of wage-earners, and by lessening or preventing the importation of foreign manufactured goods, which have also to bear the cost of transportation to this country. Yet, such a tariff merely benefits the proprietors of factories, and not their so-called workingmen, too. By the bye, in a free country there should be only workingmen and not drones of society, because useful employment, not idleness, is life's real problem. Useful work, however, does not exclude the social enjoyment of life, by amusement or recreation, at the proper time.

Those proprietors of factories by no means equally, in a co-operative manner, share their profits with their operatives. They, as a rule, pay the latter what they please or see fit, and no law of arbitration can compel them to pursue another course in this respect. In the hands of those proprietors, by a protective tariff, capital unjustly accumulates, rendering them monopolists, and at the same time unduly laying the fate of their laborers into their hands. Favoring the few at the expense

of the many, a protective tariff will never be in harmony with the free institutions of this country. It opposes the cardinal principle of our American freedom, laid down in the Declaration of Independence, namely, the principle of equal rights for all in all matters of public concern, that is, matters affected or to be affected by law. A protective tariff, producing affluence among the manufacturers and pauperism among their workmen, separates, *by law*, the people of this country into rich and poor, capitalists and laborers, as *classes*, and thus practically creates a class distinction. Under its operation, the social life and the social education of this country will never be what they should be. It is true, however, that no so-called laborer or workman of this country should consider himself a hired man for life. Every one of them should unceasingly try, by energy, industry, and circumspection, to become independent in business and his own boss, even if he do not succeed. Farming, for supporting a man more directly than any other kind of work, is doubtless the most natural and most satisfactory of all human employments. For this reason, the farmers of this country are the most contented and most independent men among the American people.

There is no sense or truth in large, overcrowded cities of this country, with its yet thinly settled territory, taken as a whole. Such cities represent wealth very unequally distributed, but not necessarily education, money being only a means of civilization, and not civilization itself. They promote the progress of science and of useful arts to a certain extent, but they are also hotbeds of crime and vice. The capital, by unfair and unjust national legislation, in the shape of a protective tariff, amassed and amassing in such places, induces poor people to flock there from less favored localities in pursuit of their happiness, which they, with few exceptions, can and will not find in those cities. Is this a worthy aim of the political economy of this free country?

A protective tariff, for enhancing the prices of foreign and domestic goods, renders the hard-earned money of the masses of the American people cheap. But dear money, purchasing a large quantity, not cheap money, purchasing only a small quantity of goods for the same sum, should be the leading principle of the political economy of this country. It most benefits the masses of the people. An over-coat keeps a man just as warm if it costs only ten dollars, instead of twenty dollars, that is, the same over-coat,—and an orange, that is, the same orange, tastes just as good if it costs only one cent, instead of two cents. The ratio of the purchasing power of money and of the selling power of goods is an inverted one: if money is dear, goods are cheap; if goods are dear, money is cheap. The real value of money consists in its circulation for legitimate business purposes. The observance of the principle of dear money,

just stated, could and would not prevent at all the American people from becoming possessed of as much gold and silver coin, or, in other words, real money, as possible; a state of affairs which is, of course, very desirable for this country. When our national debt will be finally paid, the United States notes (greenbacks), for forming a portion of the same, and the national bank notes, for being secured by government bonds, will disappear. In their stead, the American people should have an ample amount of paper currency, consisting of gold and silver certificates, based upon deposits made by the people with the government of gold and silver coin, and being redeemable in their respective coin at any time.

In this connection a few remarks may be ventured on the silver question. The American silver dollar, as to its bullion value, is at present greatly depreciated, in comparison with our American gold dollar. For this reason gold coin does not circulate so freely in this country as silver coin, the people, when making payments, always selecting the intrinsically less valuable coin of the two, to do so. Congress, therefore, should make the bullion value of silver dollars, to be coined in the mints of the United States, as nearly equal to that of gold dollars as this, in consideration of the fluctuating price of silver, can be done. Gold, as the more valuable of the two metals named, is the standard money of the leading civilized nations of the globe, our own American nation included, both at home and in their commercial intercourse with each other. It, therefore, would be an easy thing for the nations referred to to unite upon a common or equal ratio between the value of gold and silver. Yet, it appears that they are not willing to do so. Money being power, nations are as zealous and jealous in money matters as private individuals. The American people, therefore, are compelled to find an expedient of their own for coining silver dollars in bullion value as nearly equal as possible to gold dollars. How would the following suggestion do in this respect? Let the present compulsory coinage of silver dollars by our national government be stopped forever. Let, in the same manner as we have free coinage of gold, also free coinage of silver be established at our American mints, enabling private parties, defraying the necessary expenses, to have as much silver coined there as they choose. Let Congress annually, according to the current price of silver, equalize the bullion value of the silver dollars, to be coined in our American mints, during the fiscal year following, with that of the gold dollar. Let annually, provided it become necessary annually, a change be decreed by Congress in the coinage of the silver dollar as to its bullion value, whenever the same should have become less or more valuable by three per cent. than the gold dollar. As to ascertaining the current price of silver, it may be stated

that the United States Treasury Department daily receives a cable dispatch from London, England, by which it is informed of the price of silver there, which is considered as the standard for the current price of this metal in this country. The government would, of course, have to receive all depreciated silver dollars presented to it in payment of public dues. Yet, it should make all its own silver payments in the correct silver dollars described, of the latest coinage, as far as it might have them on hand, and it should gradually recoin depreciated silver dollars formerly coined into silver dollars having the latest bullion value decreed by Congress. Silver dollars overvaluable, as stated above, as to their bullion contents, whenever there should be any such in its possession, should also be recoined by the government into correct silver dollars. The correct silver dollars described might, to a certain extent, also go to foreign countries. Free coinage of the same would, of course, not prevent at least as many of them being coined at our American mints as depreciated standard silver dollars, under compulsory coinage, are being coined there now. Such an independent, although very tedious financial policy, firmly adhered to by the American people, might, in the course of time, force the European nations to make the desirable agreement, relating to the silver question, they now decline to make voluntarily.

The bulk of the revenue of our national government is derived at present from duties levied on foreign imported goods (customs), and from taxes levied on domestic articles; namely, on tobacco, prepared for use, and on alcoholic beverages (beer and whisky) produced in the United States (internal revenue). Strangely, and not in harmony with our American principle of equal rights for all, in all matters of public concern, the internal revenue is derived only from those so-called luxuries and not from other products of this country. Yet, to succeed in their business, the producers in the United States of the luxuries referred to must be as industrious as the producers of necessities of life. Besides, as free men, they are entitled to exactly the same immunities as all their American fellow-citizens. Justice, therefore, forbids their productions to be taxed and others not. Whisky not subject to taxation would not mean free or gratuitous whisky, because the consumer would have to pay for it also when not taxed to the producer, although a lower price. In reality, neither of the two sorts of luxuries named—tobacco and alcoholic beverages—seems to be worth a high price.

From the foregoing discussion it is to be seen that neither the customs system nor the internal revenue system of our national taxation is very practical or rests upon a sound and rational foundation.

*(To be continued.)*

Poetry is more earnest and more philosophical than history.—*Aristotle.*

## UNDERSTANDING ONE'S NEIGHBOR.

BY XENOS CLARK.

If the proper study of mankind is man, then, as the nearest man, one's neighbor naturally suggests himself as an object of examination and reflection in spare moments. People ordinarily imagine they know their neighbors pretty well, but this is apt to be an illusion; a neighbor, in fact, is generally an uncomprehended entity; even his hat is different from our hat, and how much more that complex garment, his mind. To understand this mind as it is in itself, though a difficult matter, is, of course, what we all should attempt, instead of thinking it a mere dumb appendage of our own lives. If, for instance, our neighbor is commonplace, instead of contemning him it may be better to ask why he became so, and whether he suspects it, and what effect the suspicion has on his mind. Is he, for instance, a young man weakly aware that Nature has clothed him with inferiority, and does he walk through life with persistent, half-foolish consciousness of being at the foot of the class? For one to comprehend such a life, not from one's own standpoint, but from the possessor's, is to feel a nameless, mother-like pity for the victim.

Or perhaps this neighbor is commonplace in the conceited way, which thinks it knows everything because it knows nothing. To argue such a neighbor out of a misconception is like getting a pig to market, and so the pig gets anathematized. This, however, is not comprehending the pig; and if one ceases anathema and turns to comprehension, it will be seen that the pig thinks he is right and cannot help what he does. Perhaps after all the best way with an ignorantly disputatious person is to humor him in his conceit. Let him have his pleasure; accept his opinions; confirm them by unsuspected instances; poor, conceited fellow! you are the first person who ever agreed with him; he will blossom like a rose with delight, and will greet you with a smile for months afterwards.

To a man with theological leanings his neighbor's creed is always a matter of interest, but this, too, is likely to be viewed in an external and uncomprehending way; and what is asked is not, Why does he have his creed? but, Why does n't he have mine? This is to forget that our neighbor is an independent being with a mind and heart of his own; with an inner history of which we know little; and with perhaps a whole range of feelings inscrutable to our experience. Here, for instance, is Mr. Matthew Arnold, one of the most rational of neighbors; and yet he exasperates his American readers by advocating the retention of the Church of England, and even its retention as a state church. By an effort at comprehension, however, it is revealed that what impresses Mr. Arnold is the inestimable role his English state church has played in fostering a cultivated life among the clergy and the people; and this role no one can go to England

or to English literature without observing. It is as much a part of the country as the soft greenness of the landscape, or the impressive prevalence of well-established amenities in family life. Moreover, Mr. Arnold knows that the Church of England is a very elastic institution with a power of progressive growth; and he humors it as one humors a good man of great influence but partly mistaken opinions, in order not to lose the influence of this good man, and with the hope that his opinions will gradually change for the better.

If our neighbor is a commonplace man, his creed, of course, is commonplace. Yet in its poor old way how much it may help him, who perhaps would fare but poorly on our rational diet. Our commonplace neighbor knows little of Truth with a capital T, although he will give reasons for his creed if you drive him to it, as a hen takes to water in extremity, and will even refuse to give up a single one of its particulars. But we shall be more commonplace than he if we suppose that he really prays to God when he goes to bed every night for these reasons. On the contrary, this creed is simply his because it was his father's, or because his wife taught it to him, or because when a young man some "experience meeting" changed him from a careless youth to a serious believer. And since that time he has taken his bath every Sunday morning, and then gone to church with his wife and children, and it makes him feel right and good; and so he believes his creed must be right and good, too.

Quite a different person is our opinionate neighbor, though he too will repay an unselfish effort to comprehend him. An early result of this effort is the perception that it is foolish and useless to argue with him, is time thrown away for no result save exasperation on both sides. Though a man perhaps of excellent character, yet he is to be pitied. All the graces of intellectual modesty and self-doubt are lost to him; all the openings for intellectual growth are closed; the happiness of giving up an erroneous opinion, the joy of receiving a gift-thought from another he never can know. The mind of this opinionate neighbor resembles a bin full of crooked sticks; intellectual conversation for him consists in exhibiting to you these sticks one by one and insisting on their straightness. Instead of uselessly doubting him, which will bring on a fight, hammer and tongs, it is better to change the subject happily; in fact there is no pleasure like the discovery, so frequently possible, that inside the crooked fence of his "views" our opinionate neighbor has a mellow and blooming plot of ground, a kind heart. And if he has not, then of course it is all the more pitiful, especially in relation to his family; for to his wife, to his brother, to his children, the obstinately opinionate man is a sorry trial indeed. He resembles a crooked gun; the only way any one can obtain what any one wishes from him is by aiming away from the

mark. Thus, after all, his most surprising trait is his blindness, for he goes through life compelling every one to deceive him and play upon his vanity, and yet without once suspecting it.

Beyond question the greatest good a man can derive from an unselfish effort to comprehend his neighbor, a commonplace or opinionate one, for instance, is the discovery, sure to come about, that he himself in some particular is commonplace or opinionate also. This is a bitter thought, but proves tonic when swallowed frankly. The old felicity with which one contemplated his neighbor's shortcomings is now suddenly clouded by the reflection that if the neighbor is so calmly unsuspecting of his faults, such may also be the case with one's self. Though disillusioning, to any one with a sense of humor this experience is amusing too; and, what is more, it marks progress in character. Another effect of the attempt to see a neighbor's life inwardly is a sudden realization of what a blundering and misconceiving world this is; for it now occurs to us, like a revelation, that our neighbor possibly suffers the same pains of miscomprehension that have been bitter to our own heart. We have been thought surly when we were simply ill, or proud when simply hiding trouble, or unfaithful when driven by a hidden necessity; so, too, may it be with our neighbor as we have falsely seen him. A man on realizing this thought feels a sudden swelling of his heart toward his neighbor. Dear neighbor, he says, how blind I have been to your real life; I have not thought of you as if you were a human being at all. I have been wrapt up in the narrowness of my own mind, and only just now have I discovered it.

Perhaps this thought is the beginning of a new and more comprehending life—a life in which all humanity is seen as one's neighbor.

#### A CREED.

BY CLIFFORD LAMONT SNOWDEN.

Hold Honor with thyself, nor fear  
That thou shalt others wrong;  
Hold Honor with thyself and feel  
That thou, the weak, art strong.

Hold Honor with thyself and know  
Man will behold in thee  
A *DAIMON* prompting all thy deeds,  
A power just and free.

Hold Honor with thyself and learn  
Men bound with Right are strong;  
Right bound with Right in motive pure  
Conquers a world of wrong.

## GOETHE'S MONISM.

The famous scientist Haller, who lived in the end of the eighteenth century, was a forerunner of La Marck, Treviranus, Karl E. von Baer, and others, who were the first to discover and state that evolution is the universal law of life and growth. In spite of his sound judgment and stupendous knowledge in natural philosophy, Haller had not yet freed himself from the metaphysical skepticism of his time; he believed, as most of his contemporaries did, in the fundamental unknowableness of natural phenomena. A verse of his, which expressed this at that time popular opinion, was well known and frequently quoted. It is as follows:

"Nature's 'within' from mortal mind  
Must ever lie concealed.  
Thrice blest e'en he to whom she has  
Her outer shell revealed.

Goethe could not be reconciled to this view, which splits Nature in twain and places us as well as our inquiring mind outside of Nature, as if we were locked out from her secrets for ever. He replied to Haller's verses in a short little poem, which is not so much known as it deserves to be:

"In's Innere der Natur"—  
O du Philister!—  
"Dringt kein erschaffner Geist?"  
Mich und Geschwister  
Mögt' ihr an solches Wort  
Nur nicht erinnern;  
Wir denken: Ort für Ort  
Sind wir im Innern.

"Glückselig! wem sie nur  
Die äussere Schale weist!"  
Das hör' ich sechzig Jahre wiederholen.  
Ich fluche drauf, aber verstoßen.  
Sage mir tausend-tausendmale:  
Alles giebt sie reichlich und gern,  
Natur hat weder Kern  
Noch Schale,  
Alles ist sie mit einem Male.  
Dich prüfe du nur allermeist,  
Ob du Kern oder Schale seist!

This poem has not yet, as far as we know, been published in an English translation. We present the following version:

"Nature's within from mortal mind"  
Philistine, sayest thou,  
"Must ever lie concealed?"  
To me, my friend, and to my kind  
Repeat this not. We trow  
Where'er we are that we  
Within must always be.

"Thrice blest e'en he to whom she has  
Her outer shell revealed."  
This saying sixty years I heard  
Repeated o'er and o'er,  
And in my soul I cursed the word,  
Though secretly I swore.  
Some thousand-thousand times or more  
Unto myself I witness bore:  
"Gladly gives Nature all her store,  
She knows not kernel, knows not shell,  
For she is all in one.

But thou,  
Examine thou thine own self well  
If thou art kernel or art shell."

P. C.

## THE GRAMMARIAN OF THE CELESTIAL LANGUAGE.

Similarly as Goethe and Schiller were the most brilliant twin stars in Germany's poetical galaxy, so also Bunsen's and Kirchhoff's names are eternally connected with each other in the empire of physical and chemical science. Professor Kirchhoff died lately, and Robert von Helmholtz, one of the disciples of Kirchhoff and son of the famous scientist, has published in the latest *Rundschau* (February, 1888) an essay on Professor Kirchhoff's life and merits. Kirchhoff discovered that the rays of light from the celestial bodies speak a language which can be understood by an analysis of their spectrums. He was the grammarian who deciphered the rules of that language, and who thus easily ex-

plained the dark Fraunhofer lines in the spectrum of the sun.

We publish in the present number the translation of an extract of Robert von Helmholtz's article and here add a passage from the obituary notice in the *Berichte der Deutschen Chemischen Gesellschaft*:

"In the spectral analysis of the sun as perfected by Bunsen and Kirchhoff, analytical chemistry has been enriched by a method which, through ease of manipulation and its accuracy, throws all other methods into the shade. It was a favor of fortune that led the paths of these two investigators together; for only through the association of one who stood at the head of *chemical* learning and thought with one who was a complete master of the whole field of *physical* science, could a work be accomplished which, with untiring energy, sifted, completed and extended the results of previous investigation and formed them into a new system of chemical analysis. Only through such an alliance would it have been possible for us to have in our possession an apparatus which, outdoing by far the most powerful microscope, can bring under observation vestiges of matter which were previously beyond reach of all perception.

"In 1857 the treatise on solar spectra appeared; in 1859 his work on the Fraunhofer lines, and at last his treatise on the relation between the emission and absorption of light and heat were published. How the eyes of physicists were opened! The puzzle of the dark lines which mysteriously cross the solar spectrum is solved, and with this solution a new world was opened to the science of chemistry. The debris of unknown worlds which from time to time reached the surface of our planet, had, it is true, informed us of the existence of telluric elements in the space beyond us; but that was all that we knew. With the knowledge of the relation between the dark lines of the solar spectrum and the bright colored lines in the spectra of telluric elements, the constitution of the bodies of the heavens could be determined. Seldom has any discovery exerted a more dazzling fascination upon mankind! It had appeared hitherto as the grandest acquisition that by the rays of light a fleeting picture which before was trusted to the eye alone could be permanently retained. And now it sounded like revelation when we learned that the same rays of light, forced into the service of science by Kirchhoff's genius, could unveil to mortals the very nature of the heavenly bodies.

"That proud but true saying of the Roman poet, spoken of himself, could never have come from the modest lips of the German scholar, and yet none could say with better right:

"Non omnis moriar, multaque pars mei  
Vitat libitinam."

The unity of nature is far greater than is generally imagined. Professor Werner, in Gustav Freytag's novel, *The Lost Manuscript*, dwells on this subject when speaking of the storm. On page 791 of the present number of THE OPEN COURT, he says: "There is a secret union between every movement of nature and our own spirits, and all things living, however averse to individual existence, together form a vast unity. The conception and recognition of this unity have, at all times, been the most sublime feeling of which man was capable."

#### GUSTAV ROBERT KIRCHHOFF.\*

BY ROBERT VON HELMHOLTZ.

Gustav Kirchhoff was professor of mathematical physics. I give this fact precedence, not because its importance would place it at the beginning of an article in a biographical dictionary, but because mathematical physics is a science that only those who possess an inborn aptitude for it are qualified for. There are vocations in life, there are departments of science, from which we can never ascertain what kind of people their devotees are. Whosoever intends to enter certain departments of abstract science, must possess capacities and talents of a definite order and nature; otherwise he will never get beyond the threshold.

Such a science is pure mathematics. Daily experience in schools teaches that very few are qualified for it. Still more difficult is it to determine upon what intellectual faculties it rests. Mathematics is logic applied to space and quantity. Mathematics therefore requires great power of abstraction and an intuitive conception or magnitudes and their relations. It is certain that the conception, judgment and construction of things by a mathematician must be necessarily of a special kind, because the mechanism of pure logical reasoning is eminently developed in mathematical processes.

The natural scientist, on the other hand, requires quite a different talent, that of observation. Everybody whose activity necessitates observation belongs, in the widest sense of the word, to the investigators of nature; the physician, the traveler and the collector are all natural scientists. Observation consists in noting and gathering what has been noted. According as the principle of collecting is regulated by higher and higher characteristics, observation approximates more and more to reasoning, collecting more and more to interpreting, and the knowledge of nature more and more to the exact science of nature. Its devotees no longer work with the purely æsthetic faculty of observation alone, but also with the logical power of induction. They differ from mathematicians principally in this, that the material for their thought is placed in the external world, and they must possess the talent to find it there, whereas the foundations of mathematics are given seemingly *a priori*.

Mathematics is eminently the most convenient aid of exact natural science, for the reason that it is the language wherein its conclusions may be expressed with greatest conciseness and precision. For this reason all natural science is becoming more and more mathematical. Physics, next to astronomy, has attained the greatest development in this direction, and chemistry is about to follow it. Thus to-day, that man will be, upon the whole, the greatest physicist who unites the faculty of observation with logical acuteness of thought, who has mastered experimental and mathematical science. According as the one or the other predominates, the rank of the individual investigator, in this competition of abilities, will approach either to that of an investigator of nature or to a philosopher of nature. Both are indispensable; the latter is the more uncommon, for there are always more good observers than good reasoners. Gustav Kirchhoff *belongs* naturally rather to the great thinkers, and yet his most celebrated and grandest discovery was an observation. He is therefore, as a mathematical physicist, one of the greatest of natural philosophers, for having united the faculties of observation and abstract reasoning.

\* \* \*

Kirchhoff's most popular work is the *spectrum analysis*. It has involved results most extraordinary and universal; it has come to be of the greatest significance to all branches of science; it has aroused the wonder and imagination of man as has seldom been done by any discovery, for it has opened to view worlds that seemed to be closed to us forever. It has thus become the greatest and most renowned of Kirchhoff's works.

But wonderful as these results are, we think the truly master-like work, the uncommon acuteness, the ingeniousness and assiduous spirit of the method in which Kirchhoff, from an accidental observation, induced, step by step, a universal theoretical law and with it those astonishing consequences, demonstrating all with rigid accuracy—we think this to be a greater work and more worthy of our admiration. Great men before him had had the threads of this discovery in their hands, without being able to unravel them. Frenchmen and Englishmen have asserted and still maintain rights of priority. Kirchhoff quietly, but firmly, refused to acknowledge them. They had all seen, all surmised and conjectured something as possible or probable, without Kirchhoff's having known it at the time. A safe basis, a strong proof had been given by none. It was reserved for the acuteness, thoroughness and perseverance of German scientists to elevate this idea, the result of a fortunate incident, to the domain of scientific certainty.

Spectrum analysis in the narrower sense, that is the analysis of chemical elements by spectral observations, if any distinction is to be made, is to be credited to the

idea and instigation of Bunsen. To the most ingenious of Bunsen's discoveries belong certain, simple, physical methods of qualitative chemical analysis, i. e., the determination and discrimination of chemical elements. He had ascertained as the most characteristic reaction of chemical analysis the colors of non-illuminating flames. Every chemical element in a non-illuminating flame, e. g. a blue gas-flame, whether volatilized or burnt, lends the same a certain tint peculiar to itself. We would accordingly be able to distinguish every substance by the light that its incandescent vapor emitted, were our eyes capable of distinguishing so many innumerable lines of color as there are elements in nature. Kirchhoff and Bunsen came to the aid of our vision. By means of the prism they analyzed the light of the flame into its elemental constituents and its elemental colors. In this way arose the spectrum of light produced by a flame. The rainbow is a natural spectrum of the sun's light projected through drops of rain. But this, as well as the spectrum of all incandescent solid bodies, presents quite a different appearance from that of a flame, viz.: that of an incandescent gas. The former is made up of continuous colors blending with one another in imperceptible gradations; the latter entirely of bright, separate lines which, separated by dark spaces, not only possess their characteristic colors, but lie in certain positions and at certain distances, each element having its own.

As in the heavens we recognize the constellations by the respective position and brightness of the single stars, so do we distinguish the spectrum of iron from that of copper by the respective distances and tints of their spectral lines. In fact we could dispense entirely with the colors; it would suffice to measure by a scale the positions of the separate lines, in order to ascertain from Kirchhoff's and Bunsen's tables the chemical element we had to deal with. It is marvelous, but true. A person totally color-blind could determine in this way with absolute certainty what colors a flame emits. The greatest excellence of a natural scientific method, namely, independence of subjective judgment, has been given to spectrum analysis by its discoverers. The chief work and the chief merit of Kirchhoff and Bunsen was, however, to have elaborated the proof of the correctness of their method. They have proven that the position of the lines depends upon the chemical nature of the light-emitting incandescent vapor *alone*, and not upon its temperature, or on other foreign elements present, or on the nature of the flame wherein the substance is volatilized, or on any other secondary conditions. This demonstration was given experimentally, and with great care and pains. Bunsen could therefore, very soon after his discovery, make the positive statement that he had discovered by spectrum analysis a new element, having found a salt in a certain mineral spring that showed

unknown lines. The most sensitive method of chemical analysis to-day is that by spectrum analysis.

Still more wonderful are the further discoveries by Kirchhoff and based on the method that he and Bunsen established. Kirchhoff, partly by accident, once let a ray of sunlight pass through a flame colored with sodium, and then through a prism, so that the spectra of the sun and the flame coincided. It was to be expected that the well-known yellow line of the sodium would stand out, bright and clear, from the solar spectrum: Just the opposite happened; exactly at the spot where the bright line had to show, a dark line appeared. To Kirchhoff this "reversal of the sodium line" was remarkable in the highest degree, and he at once surmised that a fundamental law must lie at the bottom of this fact. It was learned later that others had observed the very same thing, and in fact, men of the greatest authority. But the genius of Kirchhoff alone succeeded in divining and exposing the treasured truths that lay concealed within. On the day after the experiment he was already able to derive and explain the observed phenomenon from a much more universal principle which, strange to say, belongs not to Optics but to Heat. From the apparently remote principle that heat passes only from a body of a higher temperature to a body of a lower temperature and not vice versa, he induced by purely logical inferences the fact of the "reversal of the sodium line." The link of the process constitutes the celebrated "Kirchhoff's Law of the Emission and Absorption of Light and Heat," which states that all bodies absorb the very rays and very colors that they themselves emit, and that the proportion between the light absorbed and emitted is one and the same with all bodies. The treatise in which this was demonstrated is perhaps the most beautiful that Kirchhoff has written, although the least mathematical. The history of this law may serve as a model for the investigations of natural scientists; the law has been rigorously induced from more general and known principles; the law affirms something new in itself; the law covers the most diverse and special cases which may be established by experiment.

It will fall to the lot of very few to make such discoveries, but all should take pattern by his industry, logic and carefulness, and no less by the modesty with which Kirchhoff made known his discovery to the Berlin Academy: "Upon occasion of an investigation of the spectra of colored flames, conducted in common by Bunsen and me, whereby we were enabled to determine the qualitative composition of complex compounds from the appearance of the spectra of their blow-pipe flame, I made some observations which unexpectedly explain the origin of Fraunhofer's lines and warrant conclusions from these as to the elemental constitution of the solar atmosphere and perhaps to that of the brighter fixed stars."

These words prove that Kirchhoff himself inferred at once the most wonderful application of his law.

The Fraunhofer lines mentioned here, are, as is well known, the fine dark lines that cross the solar spectrum proper, that is when not seen through a flame. The nature of these lines had been formerly an impenetrable mystery. The experiment of Kirchhoff just given, showed that artificial Fraunhofer lines also could be produced by letting a ray pass through a flame.

The inference was at hand that the natural lines were produced by the same cause as the artificial ones, that they were "reversed" spectra of gaseous bodies, and that the light of the incandescent solar mass must have somewhere or other passed through incandescent gases before reaching the earth. Still more follows. If the artificial lines coincide with Fraunhofer's lines, as Kirchhoff for example proved in the case of the lines of iron, sodium and nickel, we might infer, upon the basis of the Bunsen-Kirchhoff investigation, that these chemical elements were also contained in the supposed incandescent gases mentioned. The fact that the sun consists of a dense, molten mass enclosed by a light-giving envelope, and above all, that it contains those telluric elements whose spectral lines coincide with the Fraunhofer lines, this fact resulted "with a certainty as great," says Kirchhoff, "as is at all attainable in natural sciences."

It is characteristic of Kirchhoff that he computed this certainty mathematically. It might after all have been possible that the coincidence of the bright lines of iron with Fraunhofer's lines was accidental. But the probability of this resulted only as  $\frac{1}{1,000,000,000,000,000}$ , that is equivalent to zero. "There must be a cause that effects these coincidences," says Kirchhoff. "A cause can be adduced which is absolutely efficient; the phenomenon is explained, if the rays of light that produce the solar spectrum have passed through iron vapors and there suffered absorption by the iron vapors. Furthermore, this is the only admissible cause of these coincidences; its acceptance appears therefore necessary."

We may introduce a story here that Kirchhoff himself liked to tell. The question was being discussed as to whether Fraunhofer's lines proved the presence of gold in the sun. Kirchhoff's banker remarked: "Of what use is gold in the sun to me, if I can't get it down here?" Kirchhoff received in recognition of his discovery a medal from England and the value of the same in gold. As he brought this to the banker, he said: "My friend, I've gotten gold from the sun after all."

As we already remarked, it had been a matter of entire indifference to Kirchhoff in his own estimate of the importance of his law, whether anything definite as to the nature of the sun and fixed stars accidentally resulted therefrom, or whether it possessed for the time being

only a theoretical interest. It is highly characteristic of him that he makes no mention whatever in his theoretical lecture of all that great region which his discovery made accessible, and that in his collected essays he has placed it at the end.

\* \* \*

In his inaugural address upon entering the rectorship at Heidelberg in 1865 he says: "There is a science, mechanics, whose business it is to determine the motion of bodies, when the causes that condition it are known. . . . Mechanics is closely related to geometry. Both sciences are applications of pure mathematics. The theorems of both as regards their certainty, stand exactly on the same level; we may with as much right attribute absolute certainty to the theorems of mechanics as to those of geometry."

And he adds further: "Did we know all the forces of nature and did we know what the condition of matter at any one point of time is, we would be able by the science of mechanics to deduce and determine its condition at every succeeding point of time. The highest object that natural sciences have to strive to attain, is the realization of the hypothesis just presented, namely, to refer all natural phenomena to the science of mechanics. This object of natural science will never be fully attained, but the fact that it is recognized as such, tenders a certain satisfaction, and in the approximation to this lies the highest pleasure that the study of natural phenomena can afford."

In contrast to these statements let me quote the words which have since gained celebrity and with which Kirchhoff begins his "Mechanics," published in 1875: "Mechanics is the science of motion. Its object we define to be this: *To describe with exhaustive thoroughness and the greatest attainable simplicity the motions that are taking place in nature.*"

The difference between this definition of mechanics and the first one is worthy of attention. There, then and before that large audience Kirchhoff spoke of the "causes" of motion. Here, now and in this rigorously mathematical work the word and conception of "cause" no longer occurs. The "explanation" of nature is given up, the simplest possible "description" of nature is now sought. Those words of introduction in his "Mechanics" and their elaboration in the work itself are a most pregnant and comprehensive expression of Kirchhoff's conception of nature. Of the possibility of the determination of things as such, it makes no sort of an hypothesis or supposition. Its object is to portray phenomena in a logically determined form. According to Kant, in the external world the theorems of geometry and mechanics only are logical, that is *a priori*, the principles of the latter differing from those of the former only in this, that, besides the three dimensions of space, it needs a fourth, that of time, and the conception of mat-

ter in motion. With these three fundamental conceptions of space, time and matter, Kirchhoff endeavors to accomplish his object in the description of the facts of experience. He goes beyond his predecessors in so far as to represent in purely geometrical form the conceptions of "force" and "mass," which were held to be fundamentally logical. "Force" appears to him primarily as the acceleration (change in velocity) which a particle of matter acquires in a unit of time, and the knowledge of all these "accelerating forces" at any one point of time would suffice for a description of the world. Experience has shown, that the description gains in simplicity, if we multiply the accelerations by a "determinate positive constant;" this constant is called the "mass" of "the particle in motion."

\* \* \*

Kirchhoff's aspirations after light and truth in everything, are prominently marked in his philosophical attitude, and caused him to interpret his mission in science rather too rigorously to admit even the semblance of dogma in it, as perhaps the uniformity of nature suggests. And yet it is not only as a critical thinker that he analyzed nature. His greatest discovery shows that he possessed that quick discernment, that ardent investigation, that intuitive insight into the workings of nature's forces, without which the true scientist can never successfully work. We repeat: Kirchhoff ranks among the first of natural philosophers because, as a mathematical physicist, he united the faculties of observation and abstract reasoning.

## CORRESPONDENCE.

---

### "THE SECULARIZATION OF RELIGION" BRIEFLY REVIEWED.

To the Editor:

Assuming that THE OPEN COURT is open to any rational and courteous rejoinder to any of its contents the following is respectfully submitted:

In the article captioned as above in the November issue are some striking truths mixed with and marred by some equally evident misapprehensions. To begin with, I agree with the author that, so far as any proof or demonstration known to me will go, the brain is the seat and organ of mind and that the existence of a spiritual essence in man, commonly called the soul, and of which independent existence is predicated, is a pure assumption, a philosophical speculation. This "irrational hypothesis of a vital principle," by which I suppose is meant a deathless principle, does not, however, underlie Christianity; it has been foisted upon Christianity and its influence therein has been insidious and destructive. The author's concluding sentence: "Modern Christianity is something very different from that of its founder, being, indeed, mainly Alexandrian neo-Platonism, metamorphosed and blundered by nescient emotionalists," contains also much deplorable truth. Myself an ardent Christian, I wish to be entirely impartial, to acknowledge errors and claim only what facts require. The difference stated above has occurred to the doctrinal bases of Christianity. It may have impaired its ethical value, but the self-sacrifice and benevolence which are to-day the attributes of every one worthy the name of Christian have found exem-

plans in the Church even in the darkest and grossest centuries. In its ethical character Christianity is nearer its founder than in its eschatology.

Jesus did not say what is so often attributed to him, viz.: "The kingdom of God is within us." The true translation of Luke 17-21 is: "in the midst" or "among," and referred to his own presence, as the succeeding context plainly shows. And he did not say "us," but "you," referring to the Pharisees, who appeared to possess no seed of heavenly truth.

In accepting the author's closing paragraph in its doctrinal sense I wish emphatically to except from its sweeping statement a very considerable portion of the Church, of whose number the writer is one. We may not dogmatically declare that the man, the whole man, the ego, the thinking, willing and executing man, is an organization of matter and nothing more, though we are able to discover nothing else but the life principle common to all grades of animals. We, however, unhesitatingly reject the half platonic theory that man is an immortal spirit. The original and complete speculation was that man had neither beginning nor end. The half-converted Greeks who foisted the mutilated theory upon the Church and through the hands of Augustine succeeded in riveting it there, greatly damaged but did not destroy the Christian system. They were actuated by the motive that prompts men to day, both inside the Church and out, the desire to have a more "lofty philosophy." There are many who cannot endure the sort of faith that Job had. He knew nothing of immortality, but believed in God. He expected to die and moulder to naught, but he knew that every intelligent being loved its own creations, and so he says: "Thou wilt have a desire to the work of thine hands, Thou shalt call and I will answer Thee." All known heathen peoples have believed in a life beyond the grave as a continuance or a consequent of this life, many in an endless life. It is singular that the Hebrews alone believed in revivification only by resurrection at the will and pleasure of God. The fact that Jesus and Paul and John teach precisely the same doctrine and that science to this day has been unable to discover any other road to the much-coveted future life looks a little like a consensus.

The author is right in saying that the Bible nowhere teaches man's natural immortality; he is totally wrong in saying that it does teach that the identical body which died and decayed, and which science teaches is resolved into its constituent elements, will be literally restored. Let him read Corinthians 15, in which Paul distinctly declares that it is not the same body. Those of the Church, who believe that man is a spiritual being *now*, speak of the "resurrection of the body." A more accurate phraseology is the "resurrection of the man." Resurrection means "raising up to perfection of life," and is practically understood as re-creation without loss of identity. Paul plainly says it is a mystery, and I suppose the most "advanced" rationalist will accept a well authenticated fact, however mysterious it may be. Paul plainly hinges faith in the resurrection of the faithful on the already proved return from death of the Savior. There stood the indisputable fact, attested by over five hundred persons who knew Jesus "after the flesh." Our author seems to scoff at the "stigmata of nail-marks," and says that faith in the resurrection is not a "lofty philosophy." That is true. The world has been surfeited and confused with too many lofty philosophies that tickled and puffed up and deluded poor humanity up to the brink of the grave and then deserted the hopeless wretches, leaving them to flounder in vague and sounding phrases or to sink in despair. Jesus returned bearing the nail-marks that every carping mouth should be closed forever. Had he come without them it would have afforded a pretext for unbelief, as in the case of Thomas. It is scarcely gracious or scientific to object to the proof which would surely have been demanded if absent.

That the bruised body of Jesus, in which he showed himself after his resurrection, was his true and glorious one is not likely. To mortal eyes that could bear no other, and for the confirming of their faith, he thus appeared, but he was "raised a spiritual body," descriptions of which are found in Daniel x, and in the Revelation. It is to that "perfection of life" the spiritual body or being like unto the risen Jesus that his followers hope to attain. To say that they are immortal now is to throw the whole system into confusion.

Our author argues that to prove that "mind is brain function and nothing more" is "fatal to every form of supernaturalism." If he will explain the latter phrase by saying that it means the popular immortal-soulism of the nominal Church I will agree with him. If he desires to extend the definition beyond that point and claim that his demonstration forbids belief in a possible future re-creation of man, such as the proven resurrection of Jesus, with his infinitely sublimated powers, and the angelic appearances point to them, I say that he is stretching his evidence to cover a case that is wholly beyond its scope. The speculative errors which the Church embraced so long ago, and which she has not yet become strong enough to slough off, though hundreds of her pulpits and many thousands of her members reject them, subject her to righteous criticism. For one, I welcome these from any quarter, but those who claim to be rational and of superior wisdom should not fail to be well informed as to the real teaching of the scriptures or the progress of truth in the Church, nor should they lack in fairness in expounding the views they endeavor to supplant.

J. ALBERT STOWE.

#### MIND AND CONSCIOUSNESS.

To the Editor: HEMPSTEAD, TEXAS, Feb. 4, 1888.

You and Mr. Hegeler have expressed the desire (in a letter of December 31st, 1887) to know how it happened that in my friendly contention with Professor Cope I have used "consciousness" and "mind" synonymously. I did so, partly out of courtesy to my adversary, who habitually makes use of the phrase "mind or consciousness," and partly to carry on the discussion as much as possible on the basis given by himself.

Allow me, however, to indicate as briefly as possible how I myself distinguish "consciousness" from "mind." "Consciousness" is that state of our being in which we are aware of what is usually classified as sensations, perceptions, emotions, thoughts and volitions. When we are thoroughly asleep or in a swoon we are not aware of such affections, and are consequently not conscious.

Consciousness, of course, can be only a *present* phenomenon, a manifestation taking place within us at the *very moment*. When we are conscious of something that has occurred in the past, this retrospective consciousness takes place likewise only in the moment of present awareness. The same holds good with prospective consciousness. We foresee the future only as content of our present consciousness.

I have called this one, all-comprising moment of conscious realization "the mental presence," and have repeatedly pointed out that its contents vanish from moment to moment into nothingness, and are as constantly reconstituted, under kaleidoscopic changes, from a persistent vital matrix. Consciousness is always the effect or outcome of some underlying *activity*, never itself the manifesting substrate.

The underlying vital matrix is perceived by us as the nerve-system of organic beings. And all the functional activities of this nerve-system contribute toward the production of the mental presence, though many phases of it may remain unconscious; and this not only from their not attaining a sufficient degree of intensity, but also by dint of normal disposition (see "Space and Touch," *Mind*, No. XL.).

When the term consciousness is used collectively for a series

of mental states which we experience during an hour or a lifetime, it does not denote an actual phenomenon or veritable existent, but stands merely as a general name, in the same way as "animal" or "plant."

The term "mind" signifies to most persons some active, immaterial agent within us, capable of producing or manifesting conscious states. As I do not believe in such an agent, I can rightly speak of mind only adjectively, as when I say: "mental states," and then "mental" is really synonymous with "conscious." Or I can speak of it, at most, as an attribute of our being, as when I say: "our mentality," which is not synonymous with "our consciousness," as it includes also the unconscious working of the brain toward the production of consciousness.

We can, moreover, not well avoid using the term "mental" as an opposite to "physical." This distinction is felt by every one to be legitimate. Yet it is incontestable that everything physical—all matter and all motion—is realized by us solely as perception of our own. We become aware of it as a peculiar kind of conscious event within our own mental presence. A physical fact is, consequently, itself of mental consistency, for it forms part of our own consciousness. And the only essential difference between it and other constituents of our consciousness lies in the fact of its being aroused in us through compulsory sense-stimulation, while other conscious states arise in us without any compulsory influence working upon us from outside our own being.

To become, however, fully alive to the radical contrast obtaining between what we call a "physical" and what we call a "mental" fact, we need only realize that mental facts, as such, are entirely imperceptible through sensory channels, while it is the very characteristic of physical facts to be thus perceptible. I can touch your physical being, hear your voice, and see your body move and gesticulate; but I cannot touch, hear or see any of your sensations, perceptions, emotions, thoughts or volitions. These are inwardly or retrospectively realized by yourself alone.

The distinction here established is essential. It excludes first of all the possibility of our entire being consisting of mind-stuff, as believed by idealists of all shades. And it excludes also the possibility of anything mental being in the remotest degree akin to physical forces, as taught by materialistic thinkers, for no one can deny that we give the name of "force" only to that which is capable of affecting our senses in some way or other, and this is exactly the kind of effect that nothing purely mental can produce.

Yours, very truly,

EDMUND MONTGOMERY.

#### THE PHILOSOPHY OF MONISM.

To the Editor:

ATLANTA, ILL., Feb. 18, 1888.

The Philosophy of Monism, as I understand it, explains the unity and the simplicity of the supreme laws of nature.

It is in accord with Monotheism as well as Pantheism, if they are rightly interpreted. It unifies all phenomena, both material and spiritual. It reconciles and unites God and nature, spirit and matter, and makes them consubstantial and correlative. I believe in a natural religion, in adoration and in the immortality of the soul. I believe with Goethe, when he says: "Certainly there does not exist a more beautiful worship of God than that which needs no image, but which arises in our hearts from converse with nature." It is through this kind of worship, enlightened by science as interpreted by the Monistic Philosophy, that we are led to the sublime idea of the unity of God and nature.

Monism is supported by our most advanced science; it is optimistic and, unlike dualism, it introduces no intellectual confusion, no antagonisms into science and religion. Emerson must have believed in monism when he said: "Let us build altars to the Blessed Unity and the beautiful necessity which holds nature

and souls in perfect solution and compels every atom to serve an universal end and which secures that all is made of one kind.

"In astronomy is vast space, but no foreign system; in geology vast time, but the same laws to-day.

"Why should we be afraid of nature, which is no other than philosophy and theology embodied? Law rules throughout existence, a law which is not intelligent, but intelligence, not personal nor impersonal—it disdains words and passes understanding, it dissolves persons, it vivifies nature; yet solicits the pure in heart to draw on all its omnipotence."

The Philosophy of Monism gives me intellectual satisfaction, because of its ability to unify and reconcile heretofore discordant theories of things. For instance, by monism, both the *a priori* and *a posteriori* ideas of the mind are recognized and their differences satisfactorily explained. Also the doctrines of animal types and animal descent are reconciled, and Cuvier and Darwin were both needed, and both were right if also a little wrong. Monism makes life worth living—makes existence the highest boon, and teaches that next to non-existence *anti-naturalism*, as inculcated by the pessimistic religions, is the greatest calamity.

W. W. RICHMOND.

#### BOOK REVIEWS.

WINTER. From the *Journal of Henry D. Thoreau*. Boston: Houghton, Mifflin & Co., 1888.

Somewhere Thoreau wrote: "I desire so to love wisdom as to live according to its dictates a life of simplicity, independence, magnanimity and trust." And surely there are but few men who can boast greater success in the achievement of their desires. To such an extent was he successful, that on his death-bed he could say, "I regret nothing."

It is but natural that a man who both in his life and in his writings waged such open war against society and all its established laws and customs should incur the dislike, not to say hostility, of many—unsympathetic critics in particular—who were all too ready to call him a "prig" and a "humbbug," and to detract from him in every possible way until their detraction necessarily reflected upon themselves. But those who knew him (and they are the ones whose judgment all unprejudiced people will accept) agree in pronouncing him to have been as sincere and as pure a man as could be met with. He certainly was a man of extraordinary parts. His whole life was devoted to self-development and self-improvement. He cultivated all his powers and in whatever he undertook to do he was successful. His senses were the most acute conceivable, eyes and ears, nose and tongue,—and his mind was equally acute. "He saw as with microscope, heard as with ear trumpet, and his memory was a photographic register of all he saw and heard." So far as society and its artificial paraphernalia were concerned, he was essentially a negative spirit; but in the realm of nature and in the domain of truth he was an enthusiastic, bold and fearless champion.

No matter in what phase of his career we view Thoreau, whether as poet, philosopher or naturalist, what everywhere impresses us most strongly is his personality. He was the individualist of individualists. His existence was the practical demonstration of his theory of life. Such absolute independence, such self-poise, such self-reliance as he everywhere exhibited could be produced only in this country. He felt no obligations to any one; to himself alone he felt accountable. His mind was quick; he knew his own convictions, and when the occasion arose he said what he had to say and not what he might be expected to. After the arrest of John Brown, when Massachusetts and indeed the whole North were still doubtful and undecided, it was Thoreau who first had the courage to step forward and raise his voice in defence of the hero of Harper's Ferry.

It is much to be regretted that hitherto no adequate biography of Thoreau has been published. All the accounts of his life that have been written are at best unsatisfactory. His inner life is fully and strongly depicted in his writings. Not a page that does not unmistakably bear his stamp.

This last volume, made up of further extracts from his journal, will be welcomed by all who have in any way come in contact with the individuality of Thoreau. It is as characteristic and as interesting as any one of its predecessors. It is full of those original, pithy sayings for which he is famous, and in the thought and construction of which he ranked second to none—Emerson, perhaps, excepted. We quote the following at random: "I do not think much of that chemistry that can extract corn and potatoes out of a barren soil, compared with that which can extract thought and sentiment out of the life of a man on any soil." "It is in vain to write of the seasons unless you have the seasons in you." "Man's noblest gift to man is his sincerity, for it embraces his integrity also." "I would be in society as in the landscape; in the presence of nature there is no reserve nor effrontery."

We are accustomed to think of Thoreau chiefly as a naturalist; and all the titles of his books would lead us to infer that such was the case. But he was much more than that. He was above all a humanist. All of his endeavors were directed toward establishing the relation of life to nature, and toward discovering the analogies between our existence and the rest of creation. As Emerson said: "His soul was made for the noblest society; wherever there is knowledge, wherever there is virtue, wherever there is beauty, he will find a home." H. F.

VIRGINIUS PUERISQUE, AND OTHER PAPERS.—MEMORIES AND PORTRAITS.—MEMOIR OF FLEEMING JENKIN. By Robert Louis Stevenson. New York: Charles Scribner's Sons.

Rarely has an author achieved such sudden and phenomenal success as has Mr. Stevenson. Ever since the appearance of *Dr. Jekyll and Mr. Hyde*, Mr. Stevenson's name, although well-known long before that, has become a household word wherever the English language is spoken. The addition of the above three titles to the already extensive list of this author's writings will contribute not a little to make him still dearer, if that be possible, to those who have learned to admire him.

The first two mentioned volumes are collections of Mr. Stevenson's early essays. The main feature which lends to them their great charm is the perfect honesty displayed by the author and the manner in which he takes his readers into his confidence. From cover to cover there runs an undercurrent which is, through and through, autobiographical. It is as though we met the author face to face and as though he, endeavoring to interest and entertain each one of us individually, were in the most confidential manner acquainting us with the past events of his life. We must acknowledge ourselves under the spell of personal magnetism—or, perhaps better, the magnetism of personality. It is the predominance of the subjective element without the obtrusion of excessive egotism that immediately attracts us so strongly. The writer is a keen observer, and he does not hesitate to tell what he sees and feels. That is another of his strong points. He is genuine. Although we can by no means agree with all his views, we must give him credit for having the courage of his convictions. But in one of his views we heartily concur, and that is where, speaking of Mr. W. D. Howells, he says: "None ever couched a lance with narrower convictions. His own work and those of his pupils and masters singly occupy his mind; he is the bond-slave, the zealot of his school; he dreams of an advance in art like what there is in science; he thinks of past things as radically dead; he thinks a thing can be outlived—a strange immersion in his own history! a strange forgetfulness of the history of the race!"

The memoir of his friend, Fleeming Jenkin, is a well—we may even say artistically—written account of a man who seems in every respect worthy of such a tribute. H. A. L.

FOOLS OF NATURE. Alice Brown. Boston: Ticknor & Co.

The author makes definition in her book of *Fools of Nature* as all those in whom a sensitive idealism is combined with that love of the marvelous which leads them to seek help and instruction from unusual and supposed supernatural sources. The particular form of the marvelous here dealt with is modern spiritualism. In Ben Adams and the professional medium and impostor, Professor Riker, we have excellently drawn an opposite specimen of the advocates of this particular belief. The love story which runs through the book, and which, after the first few chapters, commands the reader's chief attention, is of singular power; but we think the main problem which the author attempts to settle in the marriage of the divorced hero is treated with a somewhat morbid fancy and straining after the impracticable, albeit with much profound moral insight and purity of aim. The scene between Stephen and Sarah, when she feels compelled to leave him, reaches the height of moral sacrifice and a sublime devotion to the ideal in Stephen's words: "I haven't cared for some things you care for," he began, hoarsely, making sudden pauses between the words. "I am contented to live along and be happy. Your nature is so high that your happiness lies in renunciation. I can't bring myself up to your level, but there is one way in which I won't fail you; you shall choose your right, and I will help you to do it." There are many other quotable passages worth repeating, both for style and matter, if space permitted. C. P. W.

THE *Unitarian Review* for February contains, among other articles, "St. Paul's Doctrine of Salvation," by Conrad Mascol; "The Persistence of Caste," by Alfred H. Peters; "The Religion of Zoroaster," by David G. Hubbard, and "The Anglo-Irish Question," by Francis William Newman. Among the editor's notes are some striking remarks of the Persian Minister at the Court of St. James, quoted from the *Pall Mall Gazette*. They are an appeal for the introduction of a liberalized Christianity among the Asiatic peoples. "Believe me, neither immortality nor sectarianism is the true cause of your failure to push your civilization in Asia and Mohammedan countries. It is your Christian dogmas that offend us. We can coin dogmas, like you—better than you. We will not have them. We will have your benevolence, your charity, your justice and truth, your science of health, your railroads, telegraphs and manufactures."

A *Quarterly Review* of the work of the Societies for Ethical Culture will be published in April, July, October and January of each year, beginning with April, 1888. It is the purpose of this *Review* to present news of the Ethical Movement at large, but especially of the work in progress in the different societies belonging to the Union of Societies for Ethical Culture. The general spirit and aim of the movement will receive expression in selected addresses by the lecturers of the different Ethical societies. One such address will be given in each number of the *Review*. The members of the societies and the friends of the Ethical Movement everywhere should remember that the success of this publication depends upon their support. Subscriptions and orders should be addressed to E. J. Osler, P. O. Box 772, Philadelphia.

Men contend with one another in punching and kicking; but no one shows any emulation in the pursuit of virtue.—*Diogenes*.

The richest genius, like the most fertile soil, when uncultivated, shoots up into the rankest weeds; and, instead of vines and olives for the pleasure and use of man, produce to its slothful owner the most abundant crop of poisons.—*Hume*.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER VI.—*Concluded.*

Frau Rollmaus, however, sat smiling and contented with the philosophical system of her neighbor. Again the Professor turned to her, and spoke of the difficulty of doing good to the helpless in the right way. Frau Rollmaus acknowledged that uneducated people had a way of their own, "But one can easily get on with them, if they only know that one means well by them."

The Professor afterward gave rise to a slight misunderstanding, when he respectfully observed to the lady: "You are right, for in this field patient love is requisite to produce fruitful results."

"Yes," acquiesced Frau Rollmaus, puzzled, "to be sure, these results which you mention are not wanting among us, and they marry for the most part just at the right time; but the patient love which you so truly speak of as requisite is not always forthcoming among our country people, for in marriage they frequently consider money more than love."

If, however, the notes in the concert at the upper table were not quite in tune, yet the turkey and custard-pudding—a masterpiece of Ilse's kitchen—vanished without any adverse concussion of learned wisdom. All rose well pleased with one another; only the children, whose innocent mischief is most enduring, found with displeasure that Frau Rollmaus would not on this occasion enter into any contest in which the encyclopedia could rule as umpire. While the men drank their coffee in the next room, Frau Rollmaus again sat on the sofa, and Ilse had a difficult task to satisfy her curiosity in answering all the questions with which she was overwhelmed concerning the two strangers. Meanwhile the children besieged the sofa, lying in wait for an opportunity to undertake a small campaign against the unsuspecting Frau Rollmaus.

"So they are making researches, and in our district. It cannot be about the Indians. I did not know that any had ever come to these parts. It must be a mistake; and they must mean gypsies, who do make their appearance here. Only think, dear Ilse, a man and two women, each with a child, have come within the last fortnight. The women tell fortunes. What they have prophesied to the house-maids is truly remarkable; and in the morning two hens disappeared. Can it be concerning these gypsies? But that I cannot believe, as they are mere tinkers and good-for-nothing people. No, they are not making investigations concerning them."

"But who are the gypsies?" asked Clara.

"Dear child, they are vagabonds who formerly were a nation, and now spread themselves everywhere. They had a king, and manuscripts, and hounds, al-

though they were great rogues. Originally they were Egyptians, but also Indians."

"How could they be Indians?" exclaimed Hans, disrespectfully; "the Indians live in America. We also have an encyclopedia, and we will examine it immediately."

"Yes, yes," cried the children, and ran with their brother to the book-shelf. Each of them brought a volume with new binding, and placed it among the coffee cups before Frau Rollmaus, who looked by no means pleased at seeing the secret source of her intelligence laid bare before all eyes.

"And ours is newer than yours," cried little Franz, waving his hand. In vain did Ilse endeavor by signs of disapprobation to suppress this outbreak of family pride. Hans held the last volume firmly in his hands seeking the word gypsy, and the overthrow of Frau Rollmaus, according to human calculations, could no longer be averted. But suddenly Hans jumped up, and holding the book aloft, exclaimed: "The Professor is put down here!"

"Our Herr Professor in the encyclopedia?" cried the children.

Family feuds and gypsies were all forgotten. Ilse took the book from her brother's hand, Frau Rollmaus stood up in order to read the remarkable passage over Ilse's shoulder, all the children's heads gathered round the book, so that they looked like a cluster of buds on a fruit tree, and all peeped curiously at the lines which were so glorious for their guest and themselves.

In the article there was the usual short notice concerning living scholars, which contained the place and day of the Professor's birth, and the titles—mostly in Latin—of his works. All these titles were, in spite of their unreadable language, read aloud, with the dates and size of the volumes. Ilse looked into the book for a long time, and then handed it to the astonished Frau Rollmaus, then the children passed it from one to the other. The event made a greater impression here, on both young and old, than it ever did in literary circles. Happiest of all was Frau Rollmaus: she had sat next to a man who not only could refer to books, but was referred to himself. Her admiration of him was unbounded; she found, for the first time in her life, that she could hold agreeable intercourse with a man of this stamp.

"What a distinguished scholar!" she exclaimed. "What were the titles of his works, dear Ilse?"

Ilse did not know; her eyes and thoughts were fixed on the short notice of his life.

This discovery had the good result of causing Frau Rollmaus to lay down her weapons entirely this day, and be content not to display any knowledge, for she saw that on this occasion a competition with the family was impossible, and she condescended to an unpretend-

\*Copyright.

ing conversation over household events. But the children arranged themselves at a respectful distance from the Professor, and examined him curiously once more from top to toe; and Hans imparted the news in a low voice to the Doctor, and was much surprised that he thought nothing of it.

After coffee, the proprietor proposed to his guests to ascend the nearest hill, in order to examine the damage which had been done by the lightning. Ilse loaded a maid with provisions for supper, and some flasks of wine, and the party started. They went down from the rock into the valley, over the strip of meadow and the brook, then up the hill, through underbrush, amid the shadow of the lofty pines. The rain had washed away the steep path, and irregular water-channels furrowed the gravel; nevertheless, the women walked valiantly over the wet places. But if any one should have failed to perceive from the dress and bearing of the Professor that he walked in the confidence of manhood, they might have imagined that he was a delicately-shod lady, and Frau Rollmaus a gentleman in disguise, for she hovered round him reverently, and would not leave his side. She directed his attention to the stones, and, with the end of her umbrella, pointed out the dry places to him, and stopped at times, expressing her fear that he would find this jaunt too fatiguing. The Professor submitted, though much surprised, to the homage of the little lady, sometimes looking enquiringly at Ilse, over whose face flitted a roguish smile. On the height the path became easier, and some trees of lighter foliage varied the dark green of the pines. The summit itself was clear; the heather, on which the fading blossoms of the year still hung, spread itself thickly among the stones. On all sides lay the view of the landscape, with its heights and valleys, the deep glen, and brook with its green border, the fields and the valley of Rossau. In the direction of the setting sun there rose, one behind another, long waves of undulating ground, tinted with the purple hue of twilight, passing off into the delicate gray of the mountains in the horizon. It was a delightful prospect, under a clear sky, in the midst of pure mountain air, and the party enjoyed a rest on the soft heather.

After a short stay, they proceeded, led by Hans, to the spot where the tree had been struck by lightning. A belt of high fir-trees was the place of the devastation. A strong, vigorous pine had been struck and prostrated; a desolate confusion of branches and gigantic splinters of the white wood lay all around the broken trunk, which, without its head, blackened and cloven, still rose out of its ruins as high as a house. From the confusion of branches on the ground, it could be seen that the earth also had been torn up even under the roots of the neighboring trees. The older members of the party looked seriously on the spot where one moment had turned

vigorous life into frightful deformity; but the children pressed on into the thicket shouting, seized upon the scaly cones of the past year, and cut branches from the top, each endeavoring to carry off the greatest clusters of the scaly fruit.

"It is only one of a hundred," said the proprietor, gloomily; "but it is painful to contemplate such devastation, contrary to the usual order of Providence, and to think of the destruction that impended over our heads."

"Does this recollection cause you only discomfort?" asked the Professor; "is it not also exalting?"

"The horns of the ram are hanging on the branches," said Ilse, in a low tone, to her father; "he was the sacrifice by which we were saved."

"I think, also," added the Professor, "that any one thus struck by lightning might, if time were left him for a last thought, say to himself it is the will of Providence. We soon forget, in the comforts of daily life, what we should always thankfully bear in our hearts, that we only live, like all other creatures, under certain conditions. Countless forces and heterogeneous powers unceasingly work according to their own fixed laws, maintaining, supporting, or injuring our life. The cold which checks the course of our blood, the breaking waves in which the human body sinks, the injurious vapors from the earth which poison our breath, are no accidental phenomena; the laws by which they act upon us are as ancient and holy as our need of food and drink, of sleep and light; and when man weighs his position among the powers of earth, he must consider his life only as a struggle against them and an endeavor to understand them. Whoever provides the bread that nourishes us, and whoever grows the wood that warms us—every useful activity has no other purpose than by subduing and wisely utilizing these forces to strengthen and to protect us. In this work we also observe that there is a secret union between every movement of nature and our own spirits, and that all things living, however adverse to individual existence, together form a vast unity. The conception and recognition of this unity have, at all times, been the most sublime feeling of which man was capable. From this proceeds another impulse, an overwhelming desire and an irresistible longing to divine the deeper relations of these forces. And it is this that gives us faith. The method of procedure may vary in different individuals, but the goal is the same. Some, possessed of deep feeling, see only eternal wisdom in everything that to them seems incomprehensible; and in child-like faith they apply to it the most reverent and affectionate name. Others earnestly endeavor to observe the various laws and forces of nature and reverently to comprehend their relations to each other. These latter are the men of science. The men of faith and the men of science essentially do the same thing. Their attitude is very modest; for both recognize that all individual

life, both subjective and objective, is very insignificant as compared with the great All. He who could, when struck by lightning, stop to think, 'I am going to my Heavenly Father,' and he who could at such a moment intently observe the cessation of the activity of his nervous system, both would have a blissful end."

Thus spoke the Professor. The Crown-Inspector looked at the speaker in astonishment, suspecting him to be one of that new class of apostles who at that time made their appearance in various parts, and traveled around the country preaching to the people. Frau Rollmaus stood reverently with folded hands, occasionally nodding her assent. Presently she nudged the proprietor, whispering:

"That belongs to the philosophy of which we spoke."

The proprietor did not answer, but listened with bowed head. He never turned her eyes from the speaker; his observations sounded strange to her, and excited a secret uneasiness, she knew not why. But she could say nothing against them, for the spring of genial life that issued from this noble soul entranced her. The choice of words, the new thoughts, the noble expression of his countenance, captivated her irresistibly.

The party returned to their resting place on the height; the sun sank behind the hills, and the soft evening glow gilded first the tips of the heather, then rose above their heads to the tops of the trees, and purple shadows covered the ground, the stems of the trees, and the distant prospect. But small light clouds of gold and purple floated in the heaven above, till there also the glowing colors faded into rosy twilight; the mist rose from the depths below, and the colors of the earth and the heavens died away into a uniform gray.

Long did the party gaze on the changing lights of the evening. At last the proprietor called for the contents of the basket; the children were busy unpacking and passing the cold meats to the assembled circle. The proprietor poured out the wine and pledged his guests and rejoiced in the fine evening. At a sign from his father, Hans ran into the thicket and fetched some pine torches.

"There is no danger to-day," said the proprietor to Herr Rollmaus whilst lighting the torches.

The children pressed forward to be torch-bearers, but only Hans was trusted with this honorable office. The gentlemen carried the others.

Slowly did the procession wind down the hill-path; the torches threw a glaring light on copse and stones, and on the faces of the men, which in the curves of the road were lighted up with a glow like the rising moon, and again disappeared in the darkness. Frau Rollmaus had endeavored several times to draw the other illustrious stranger into conversation; she now at last succeeded, when in a bad part of the road. She began:

"What your friend said was very good, for it was

very instructive. He is right; one ought to struggle against the powers and seek the connecting link. But I assure you it is difficult for a woman. For Rollmaus, who is the first power of nature for me, has a hatred of principles; he is always for doing everything according to his own ideas, and, as an independent man, he has a right to do so; but he is not very much in favor of science, and even as regards a piano for the children I have trouble with him. But I seek after principles and powers, and what is called the connecting link; and I read what I can, for one likes to know what passes in the world, and to raise oneself above ordinary people. But often one does not understand a thing even when read twice; and when it is at last understood it may have become obsolete and no longer worth anything, and so one might as well give up all researches."

"You should not do that," exclaimed the Doctor; "there is always a secret pleasure in knowing something."

"Not so," continued the lady; "if I lived in town I would devote myself to learning, but in the country one is too much isolated, and there is the housekeeping and one's husband, who is hard to please. You have no idea what a good farmer he is. Rollmaus, hold your torch aside, all the smoke blows in the Doctor's face."

Rollmaus turned the torch away grumbling. His wife drew close to him, seized his arm and whispered to him: "Before we go away you must invite these gentlemen to visit us; it is the right thing to do."

"He is a hedge priest," answered the husband, peevishly.

"For God's sake, Rollmaus, don't do anything foolish; above all, do not blaspheme," she continued, pressing his arm; "he is mentioned in the encyclopedia."

"In yours?" asked the husband.

"In the one here," replied the wife, "which amounts to the same thing."

"There are many things in books that are of less value than others which are not there," said the husband, unmoved.

"I am not to be put off in that way. You will not confute me by that," replied the wife. "I tell you that he is a man of renown, and propriety demands that we should take that into consideration, and you know that so far as propriety is concerned."

"Only be quiet," said Rollmaus, soothingly. "I say nothing to the contrary, if needs be; I have eaten many a sour apple on your account."

"On my account!" cried the wife, offended. "Have I been unreasonable—am I a tyrant—am I an Eve who has stood with her husband under the tree, with loose hair, and not even a chemise? Will you compare yourself and me with such a state of things?"

"No," said Rollmaus. "Only be content; you know how we get on together."

"Don't you see that I am right," replied the wife, soothed. "Believe me, I know also how others get on together, and I tell you I have a presentiment that something is brewing."

"What is brewing?" asked Rollmaus.

"Something between Ilse and the Professor."

"The devil there is!" exclaimed Herr Rollmaus, with more vivacity than he had shown the whole day.

"Quiet, Rollmaus, you will be heard; do not lose all discretion."

Ilse had remained behind; she led her youngest brother, who was tired. The Professor chivalrously lingered by her. He pointed out to her how well the procession looked; the torches, like large glow-worms, in front; behind, the sharply-illuminated figures, and the flickering of the gleaming light upon the trunks and green branches of the trees. Ilse listened to him long in silence. At last she said: "The most charming thing of the day has been your speaking so kindly to our neighbor. When she was seated by you, I felt troubled in spirit, for I thought it would annoy you to listen to the inappropriate questions of our friend, and it all at once struck me that with respect to us also you must use constant consideration, and that tormented me. But when I saw that you so kindly recognized the good that is to be found in our friend, I felt that it would cost you no great effort of self-command to hold intercourse with us simple folk."

"Dear young lady," exclaimed the Professor, anxiously, "I hope you are convinced that I only said to the worthy lady what came sincerely from my heart?"

"I know it," said Ilse, with vivacity, "and the honest soul felt it also herself—she has been quieter and more cheerful than usual the whole day—and therefore I thank you. Yes, from my heart," she added, softly.

Praise from the lips of a beloved one is not among the least of the pleasures that a man enjoys. The Professor looked beaming with happiness at his neighbor, who now in the darkness followed her brother at a quicker pace. He did not venture to break the silence; the pure hearts of both were revealed, and, without speaking a word, they became conscious of a stream of warm feeling passing from one to the other.

"The pedantic habit of reading," began the Professor, at last, "makes it easier, perhaps, for one to gather from a different style of life what may be serviceable to one's own; for there is something estimable about every mode of life, although it may be somewhat veiled by certain peculiarities."

"We are commanded to love our neighbors," said Ilse, "and we endeavor to do so; but when one finds that this love is given so cheerfully and nobly, it is touching; and when one sees such feeling displayed, it becomes an example and elevates the heart. Come, Franz," she said, turning to her brother, "it is not far

from home." But Franz stumbled, and, half asleep, declared that his legs ached.

"Up with you, little man," said the Professor; "let me carry you."

Ilse, distressed, tried to prevent it. "I cannot allow that; it is only sleep that makes him so lazy."

"Only till we reach the valley," said the Professor, raising the child on his shoulder. Franz clasped his arms round the Professor's neck, and, clinging close to him, was soon fast asleep. When they came to a steep turn of the road, the Professor offered the arm which was free to his companion; but she refused, only supporting herself a little with his offered hand. Thus hand in hand they walked down the last part of the hill into the valley, neither of them speaking a word. When they arrived at the bottom, Ilse gently withdrew her hand, and he released it without word or pressure; but these few minutes comprised for both a world of happy feelings.

"Come down, Franz," said Ilse, taking her sleeping brother from the arm of her friend. She bent down to the little one to encourage him, and they went on to join the party, who were waiting for them at the brook.

The carriage of the Crown-Inspector drew up. The parting greetings of his wife were very verbose, and her representations had mitigated his obstinacy, so that, cap in hand, he made up his mind to take, with tolerable decorum, a bite of the aforementioned sour apple. He approached the literary gentlemen, and asked them to grant him also the pleasure of a visit; and even the utterance of these friendly words had a softening influence on his honest spirit. He now held out his hand to them, and receiving a hearty shake, he began to think that the strangers were not in reality so bad as might be supposed. The proprietor accompanied his guests to the carriage, Hans passed the handbox in, and the two country-gentlemen, as they bade each other good night, watched the starting of the two horses with the eyes of connoisseurs.

## CHAPTER VII.

### NEW HOSTILITIES.

Whilst a bright female form was intervening between the Professor and the Doctor, fate decreed that a new feud should arise between the two neighboring houses in the city. It happened thus:

Herr Hahn had availed himself of the absence of his son to beautify his property. His garden ran in a point up to the park, and he had bethought him much how this corner might be turned to good account; for the little elevation which he had thrown up there, and planted with roses, seemed unsatisfactory. He determined, therefore, to erect a water-proof summer-house for such visitors as were not inclined in bad weather to resort to the house. Everything had been wisely considered before the departure of his son. The following day

he caused a slender wooden structure to be erected, with small windows toward the street, and above, instead of a roof, a platform with benches; the laths of the roof projected boldly into the air, over the wooden walls and garden palings. The thing looked well; but when Herr Hahn, with hearty satisfaction, led his wife up the small side steps on to the platform, and the plump lady, not anticipating anything wrong, sat down on the airy bench, and from thence looked with admiration on the world beneath her, it became apparent that the passengers in the street passed directly under her, and the sky above them was darkened to whoever passed along the fence by the plumage of the great bird that, perched on her high seat, turned her back to the street. Before a quarter of an hour, therefore, had passed, such sharp remarks were heard that the inoffensive Frau Hahn was on the point of weeping, and declared to her lord, with unwonted energy, that she would never again allow herself to be treated as a hen, or ascend the platform any more. The family frame of mind was not improved either by the part that Herr Hummel had taken, for he had stood by the fence of his neighbor's garden during this exhibition of Frau Hahn, and had laughed insultingly at the vile speeches of the people.

Hahn, however, after a short struggle between pride and discretion, listened to the voice of his better self, removed the benches and the platform, and erected over the summer-house a beautiful Chinese roof; but on the projections of this roof he hung small bells, which sounded softly when the wind rose. This idea would have been a decided improvement; but, alas! the wickedness of man gave no rest to this work of art; for the urchins in the street diverted themselves by keeping some of the bells in movement by means of long switches. On the first night, therefore, the neighborhood was awakened from its slumbers by a concert of many bells.

It appeared to Herr Hahn in his sleep that winter was come, and that a merry party of sleighs were passing round his house; he listened, and indignantly discovered that his own bells had been excited into activity. He hastened into the garden in his night-dress, and called out, angrily:

"Who is there?"

In a moment the ringing ceased, deep silence and peaceful quiet reigned around. He went up to the garden-house, and looked at his bells, which might be seen swinging under the darkened sky; but all around no one was to be discovered. He went back to his bed; but scarcely had he laid himself down when the noise began again, quick and loud, as if pealing for a Christmas gift. Again he rushed out of the house, and again the noise ceased; but when he raised himself above the railing and looked around, he saw in the garden opposite the broad figure of Herr Hummel standing by the hedge, and heard a threatening voice call out:

"What crazy fancy is this?"

"It is inexplicable, Herr Hummel," exclaimed Herr Hahn, across the street, in a conciliatory tone.

"Nothing is inexplicable," cried out Herr Hummel, "but the mischievous folly of hanging bells in the open air over a public street."

"I resent your attack," called out Herr Hahn, deeply wounded. "I have a right to hang up what I like on my own piece of ground."

Now there began a conflict of opposing views across the street. There Hummel's bass, here Hahn's sharp voice, which gradually rose into a counter-tenor; both figures in long night-dresses, divided by the street and railings, but like two heroes of antiquity fighting one another with strong language. If one failed to perceive the wild effect given to Herr Hahn by the red color of his night dress, yet he might be seen towering upon the height near his Chinese temple, raising his arm imposingly from the misty horizon; but Herr Hummel stood in the darkness, overshadowed by the wild vine.

"I will have you before the police court, because you disturb the repose of the citizens," cried Herr Hummel at last, but felt the small hand of his wife at his back, who seized him by his night dress, turned him round, and gently entreated him not to make a scene.

"And I will inquire before the court who gave you a right to heap abuse upon me across the street," called out Herr Hahn, likewise in the act of retiring, for amidst the noise of the fight he had occasionally heard the soft words, "Come back, Hahn," and seen his wife behind him wringing her hands. But he was not in a disposition to abandon the field of battle.

"A light and ladder here," he exclaimed, "I will find out this shameful trick."

The ladder and lanterns speedily made their appearance, brought by the frightened maid-servant. Herr Hahn mounted up to his bells, and sought long in vain; at last he discovered some one had contrived to unite the separate bells by a plait of horse-hair, and thus had rung them from the outside by one rope.

This wild night was followed by a dreary morning.

"Go to the man across the street, Gabriel," said Herr Hummel, "and ask if, for the sake of peace, he is willing to take away the bells immediately. I require my sleep, and I will not suffer that this night rabble should be allured to my house, make inroads upon the fence, steal my plums and break into my factory. This man, by his ringing, calls together all the rogues of the neighborhood."

Gabriel replied: "I will go over there for the sake of peace; but only if I may say with civility what I think fit."

"With civility?" repeated Hummel, winking slyly at his confidant. "You do not understand your own inter-

est. So fine an opportunity of making yourself important will not occur soon again, and it would be a pity to let it escape you. But I foresee, Gabriel, that, civil or not, we shall be unable to deal with the man. He's malicious and obstinate and bitter. He is a bulldog, Gabriel. There, you have his character."

Gabriel proceeded to poor Herr Hahn, who sat, still suffering, before his untasted breakfast, and looked suspiciously at the inmate of the hostile house.

"I come only to inquire," began Gabriel, adroitly, "whether you may, perhaps, have received intelligence through your son of my master?"

"None," answered Herr Hahn, sorrowfully; "there are times when everything goes wrong, dear Gabriel."

"Yes, what a roughish trick was played last night," said Gabriel, pityingly.

Herr Hahn sprang up.

"He called me insane and a coxcomb. Am I to put up with that? I, a man of business, and in my own garden! As regards the plaything, you may be right enough; one must not put too much confidence in men. But now my honor is touched, and I tell you the bells shall remain, and I shall place a watchman there every night."

In vain did Gabriel speak rationally to him. Herr Hahn was inexorable, and called after him again as he was leaving:

"Tell him we shall meet again in court."

Accordingly he went to his attorney, and insisted upon bringing a suit on account of abusive language at night.

"Good," said Hummel, when Gabriel returned from his fruitless mission. "These people compel me to take measures of security for myself. I will take care that no strange horse-hair shall be attached to my house. When the rogues sound the bells there, the dogs shall bark here. Measure for measure, Gabriel."

He went gloomily to his factory, and paced about wildly. His bookkeeper, who appeared to be a much-oppressed man, because he never could obtain his rights from Herr Hummel, thought it was his duty, and that it was a fitting time to speak.

"The ideas of A. C. Hahn are absurd; all the world finds fault with them."

But the speech did him no good.

"What do this man's ideas signify to you?" cried Hummel. "Are you the householder, and are you or I head of this business? If I choose to be angry it is my affair and not yours. His new clerk, Knips, wears his hair in frizzy curls, and perfumes himself with eau de cologne; you may make fun of him about that, this is your right. As to what concerns the rest of the world, your blame of this man's devices is worth about as much as the twittering of the sparrow on the house-top; and if he should every day hang a peal of bells on his shoul-

ders and go thus into the counting-house, he would still remain a respectable citizen so far as this street rabble is concerned. Only, as regards myself, it is another thing. I am his neighbor day and night, and if he gets into trouble I also have to suffer. For the rest, I object to all calumnies on my fellow-men. What must be said is my business alone, without associates; remember that."

A few evenings later, Gabriel was standing before the house-door, looking up to the heavens and watching whether a small black cloud, which was slowly floating past, would cover the face of the moon. Just as this took place, and the street and both houses lay in darkness, a carriage drove up to the house, and the voice of the master called out: "Is all well?"

"All well," answered Gabriel, and unbuttoned the apron.

Herr Hummel descended heavily, and behind him was heard an angry growl.

"What have you got there in the dark?" asked Gabriel, with much curiosity, putting his hands into the carriage, but he quickly withdrew them. "Will the rough beast bite?"

"Yes, I hope so," replied Herr Hummel. "I mean it to bite. I have brought some watch-dogs against the bell-ringers."

He pulled out with a rope two indistinct figures, which rushed about yelping hoarsely, circled round Gabriel's legs viciously, and drew the cord round him like a noose.

"Need you bring such a multitude?" cried out Gabriel; "there are two of them."

The clouds had passed away, and the moon shone upon both dogs.

"They are strange beasts, Herr Hummel; they are a curious race—evidently mongrels," he continued, in a depreciating tone; "hardly medium size, thick in form, and with shaggy hair; the bristles hang over the muzzle like mustachios. The mother must have been a poodle, the father a spitz; there must also have been some relationship with the pug, and the great-grandfather must have been a terrier. A fine production, Herr Hummel, and somewhat rare. How did you come by these moon-calves?"

"That was a peculiar accident. I could not obtain a dog in the village to-day; but when I was returning through the wood, the horses shied and would not move on. While the coachman was handling them, I suddenly perceived near the carriage a large black man, standing as if he had sprung from the ground. He was holding the two dogs by a rope, and laughed jeeringly at the abuse of the coachman. 'What are you?' I called out to him; 'where are you taking the dogs?'

"To him who wishes to have them,' said the black man.

"Lift them into the carriage," said I.

"I do nothing," growled out the stranger; 'you must fetch them.'

"I descended and asked, 'What do you ask for them?'"

"Nothing," said the man.

"The matter appeared suspicious to me, but I thought one might at least try them. I lifted the beasts into the carriage; they were quiet as lambs. 'What do you call the dogs?' I cried out from the carriage.

"Bräuhahn and Goslar," said the man, laughing like a devil."

"Those are not dogs' names, Herr Hummel," interposed Gabriel, shaking his head.

"I said that to the man, and he replied, 'They have not been baptised.' 'But the rope is yours,' I said; and only think, Gabriel, this black fellow answered me: 'Keep it; you may hang yourself with it.' I wished to throw the dogs out of the carriage again, but the man had vanished into the wood like a will-o'-the-wisp."

"That is a bad story," said Gabriel, much troubled; "these dogs have been reared in no Christian house. And will you really keep such hobgoblins?"

"I will make the attempt," said Herr Hummel. "After all, a dog is a dog."

"Be careful, Herr Hummel, there is something mysterious in the beasts."

"Nonsense!"

"They are monsters," continued Gabriel, counting on his fingers; "first, they have not the names of earthly dogs; secondly, they are offered without money; thirdly, no man knows what these beasts will eat."

"As to their appetite, you will not have to wait long," replied the master of the house.

Gabriel drew a bit of bread out of his pocket, and the dogs snapped at it. "In this respect they are of the right species," he said, a little tranquilized; "but what are they to be called in your house?"

"The Bräuhahn I shall call Fighthahn," replied Herr Hummel; "and in my family no dog shall be called Goslar. I cannot bear this drink." He cast a hostile look at the neighboring house. "Other people have such stuff fetched every day across the street, but that is no reason why I should suffer such a word in my household. The black shall from this day forth be called *Fighthahn* and the red *Spitehahn*—that is settled.

"But, Herr Hummel, those are clearly offensive names," exclaimed Gabriel; "that will make the matter worse."

"That is my affair," said Herr Hummel, decidedly. "At night they shall remain in the yard; they must guard the house."

"So long as they do but preserve their bodies," said Gabriel, warningly; "but this kind come and vanish as they please—not as we wish."

"Yet they are not of the devil," rejoined Herr Hummel, laughing.

"Who speaks of the devil?" replied Gabriel, quickly. "There is no devil—that the Professor will never allow; but of dogs we have cases."

So saying, Gabriel took the animals into the hall. Herr Hummel called out into the room: "Good evening, Phillippine; here, I have brought you something."

Frau Hummel came to the door with a light, and looked astonished at the present, which whined at her feet. This humility disposed the lady to regard them with benevolence.

"But they are frightful," she said, dubiously, as the red and the black sat down on each side of her, wagging their tails and looking up at her from under their shaggy eyebrows. "And why are there two?"

"They are not intended for exhibition," returned Herr Hummel in a pacifying tone; "they are country stock—one is only a deputy."

After this presentation they were carried off to a shed. Gabriel once more tried their capacity of eating and drinking; they showed themselves thoroughly satisfactory in this respect, though not distinguished dogs as regards personal beauty, and Gabriel went to his room free from anxiety.

When the clock struck ten, and the gate which divided the court-yard from the street was closed, Herr Hummel went down himself to the dogs' shed in order to initiate these new watchers in their calling. He was much astonished, on opening the door, to find that they did not require any encouraging words from him—both creatures rushed between his legs out into the yard. As if driven by an invisible whip, they coursed round the house and factory without ceasing—always together, and never silent. Hitherto they had been depressed and quiet; now, either on account of the good food they had devoured or because their night watch had come, they became so noisy that even Herr Hummel drew back in astonishment. Their hoarse short bark overpowered the horn of the night watchman and the call of their master, who wished to recommend moderation to them. They chased wildly round the court incessantly, and a continuous yelping accompanied their stormy race. The windows of the house were opened.

"This will be a stormy night, Herr Hummel," cried out Gabriel.

"But, Henry, this is insupportable," cried out his wife from her bedroom.

"It is only their first joy," said Herr Hummel, consolingly, and withdrawing into the house.

But this view appeared to be an error. Throughout the whole night the barking of the dogs sounded from the court-yard. In the houses of the neighborhood, also, shutters were thrown open, and loud words of reproach addressed to Herr Hummel. The following morning he arose in a state of uncertainty. Even his own sound sleep had been disturbed by the reproaches

of his wife, who now sat at breakfast angry and afflicted with a headache. When he entered the court-yard, and gathered from his people the complaints they had heard from the neighbors, even he hesitated for a moment whether he should keep the dogs as an addition to his household.

Ill luck would have it that just at this moment the porter of Herr Hahn entered the court-yard, and with defiant mien announced that Herr Hahn must insist upon Herr Hummel removing this outrageous barking, or he should be obliged to seek redress at the police court.

This attack of his opponent decided the inward struggle of Herr Hummel.

"If I can bear the barking of my dogs, other people can do so. The bells play there and the dogs sing here, and if any one wishes to hear my views before the police court he will hear enough."

He returned into the house and stepped up with dignity to his suffering wife. "You are my wife, Phillippine; you are a clever woman, and I will yield to you in everything wherein you show a rational will."

"Shall two dogs come between you and me?" asked the wife, with faltering voice.

"Never," replied Herr Hummel; "there must be domestic peace, and I am sorry that you have a headache, and to please you I would remove the beasts. But I have come into contact again with this coxcomb. For the second time he threatens me with justice and police. My honor is at stake, and I can no longer give in. Be a good wife, Phillippine, and try to bear it some nights with cotton in your ears, till the dogs have got accustomed to their work."

"Henry," replied the wife, wearily, "I have never doubted your heart; but your character is rough, and the voices of the dogs are too horrible. Can you, in order to establish your will, see your wife suffer, and become seriously ill, from sleeplessness? Will you, in order to maintain your character, sacrifice peace with the neighborhood?"

"I do not desire that you should be ill, but I will not give away the dogs," replied Herr Hummel, seizing his felt hat, and going to the factory with heavy steps.

If Herr Hummel indulged in the hope that he had ended the domestic struggle as conqueror, he was greatly in error. There was still another power in his home, who opened the campaign in a different manner. When Hummel approached his desk in his little counting-house, he saw near the inkstand a nosegay of flowers. Attached to the pink ribbon hung a note, which was sealed with a forget-me-not, and addressed—"To my dear Father."

"That is my bright-eyed girl," he murmured, and opening the note read the following lines:

"My dear pa, good morrow!  
The dogs cause great sorrow,  
They are not delightful;  
Their bark is just frightful;  
Their ardor and sanguinity  
Disturb the vicinity.  
For the sake of our neighborhood,  
Be noble, generous and good."

Hummel laughed so heartily that the work in the factory stopped, and every one was amazed at his good humor. Then he marked the note with the date of its reception, put it in his pocket-book, and after the examination of the letters which arrived, he betook himself into the garden. He looked at his little daughter sprinkling the beds with her watering-pot, and his heart swelled with a father's pride. With what grace she turned and bent, and how her dark locks hung round the blooming face, and how actively she raised and swung the watering-pot; and, on perceiving him, when she put it down and held her finger threateningly at him, he was quite enchanted.

"Verses again," he called out to her, "I have received Number Nine."

"And you will be my good papa," cried Laura, hastening toward him and stroking his chin; "send them away."

"Look you, child," said the father, composedly. "I have already spoken to your mother about it, and I have already explained to her why I cannot dispose of them. Now, I cannot do, to please you, what I have not yielded to your mother; that would be contrary to all family rule. Respect your mother, little girl."

"You are a hard-hearted father," replied the daughter, pouting; "and see, you are unjust in this affair."

"Oh, oh!" cried the father, "is that the way you approach me?"

"What harm does that ringing of the bells up there do to us? The little summer-house is pretty, and when we sit in the garden in the evening, and there is a breeze, and the bells tinkle gently, that sounds well—it is like Mozart's Magic Flute."

"There is no opera here," cried Hummel, angrily, "but public streets; and when my little dogs bark you can equally have your theatrical ideas, and imagine that you are in the wolf's den—in the Freischütz."

"No, my father," answered the daughter, eagerly, "you are unjust to these people; for you wish to play them a trick, and that vexes me to my heart's core. It is not worthy of my father."

"Yet you must bear it," replied Hummel, doggedly, "for this is a quarrel between men. Police regulations settle such affairs, and your verses are altogether out of place. And as regards the names, it is possible that other words like Adolar, Ingomar, and Marquis Posa, might sound better to you women. But this is no

reason for me; my names are practical. As regards flowers and books, I will do much to please you, but in the matter of dogs I cannot take poetry into consideration." So saying, he turned his back upon his daughter, in order to avoid protracting the dispute.

Laura, however, hastened to her mother's room, and the ladies took counsel together.

"The noise was had enough," complained Laura, "but the names are terrible. I cannot use these words, and you ought not to suffer our people to do so, either."

"Dear child," answered the experienced mother, "one has to pass through much in this world which is unpleasant, but what most grieves me is that which is done against the dignity of women in their own houses. I shall say no more on the subject. I agree with you that both the names by which the dogs are called are an insult to our neighbor. But if your father were to discover that behind his back we called them Phœbus and Azor, it would make matters worse."

"No one at least must give utterance to the other names who cares for my friendship," said Laura, decidedly, and entered into the court-yard.

Gabriel was employing his leisure in making observations on the new comers. He was frequently attracted to the dogs' shed in order to establish the certainty of the earthly nature of the strangers.

"What is your opinion?" asked Laura, approaching him.

"I have my opinion," answered the servant, peering into the interior of the shed, "namely, that there is something suspicious about them. Did you remark the song of those ravens the other night? No real dog barks like that; they whine and moan and occasionally groan and speak like little children. They eat like other dogs, but their mode of life is unusual. See, now they cower down, as if they had been struck on the mouth because the sun shines on them. And then, dear young lady, the name!"

Laura looked with curiosity at the beasts.

"We will alter the names secretly, Gabriel; this one shall only be called Ruddy."

"That would certainly be better; it would at least not be an insult to Herr Hahn, but only to the tenant of the basement."

"What do you mean by that?"

"The porter who lives out there is called Ruddy."

"Then," decided Laura, "the red monster shall from henceforth be named The Other; our people shall call him Andres.\* Tell this to the workmen in the factory."

"Andres!" replied Gabriel. "The name will just suit him. It will be too much honor to him."

Thus were kind hearts occupied in preventing the bad signification of the name; but in vain, for, as Laura

had correctly noted in her diary, when the ball of mischief has been thrown amongst men, it mercilessly hits the good as well as the bad. The dog was supplied with the most inoffensive name that ever was given; but through a wonderful complication of circumstances, which bid defiance to all human sagacity, it happened that Herr Hahn himself bore the name of Andres. Thus the double name of the animal became a double affront to the neighboring house, and bad and good intentions mingled together in a thick, black soup of hatred.

Early in the morning Herr Hummel appeared at the door, and defiantly, like Ajax, called the two dogs by their hostile names. The porter, Ruddy, heard the call in the cellar, hastened to his master's room, and informed him of this horrible affront. Frau Hahn endeavored not to believe the thing, and maintained that they should, at least, wait for the confirmation of it. This confirmation did not fail to come; for at noonday Gabriel opened the door of the place where the dogs were confined, and made the creatures come out for a quarter of an hour's sunning in the garden. Laura, who was sitting among her flowers, and was just looking out for her secret ideal—a famous singer, who, with his glossy black hair and military gait was just passing by—determined, like a courageous maiden, not to peer after her favorite through the foliage of the vine arbor, and turned toward the dogs. In order to accustom the red one to his new name, she enticed him with a bit of cake, and called him several times by the unfortunate name, "Andres." At the same moment, Dorchen rushed to Frau Hahn, saying: "It is true; now even Fräulein Laura calls it by the Christian name of our master."

Frau Hahn stepped to the window much shocked, and herself heard the name of her dear husband. She retreated quickly, for this insult of her neighbor's brought tears into her eyes, and she sought for her pocket-handkerchief to wipe them away unperceived by her maid. Madame Hahn was a good woman, calm and agreeable, with a tendency to plumpness and an inclination quietly to do anything for the sake of peace. But this heartlessness of the daughter roused her anger. She instantly fetched her cloak from the closet, and went with the utmost determination across the street to the garden of the hostile neighbors.

(To be continued.)

The richest genius, like the most fertile soil, when uncultivated, shoots up into the rankest weeds; and, instead of vines and olives for the pleasure and use of man, produces to its slothful owner the most abundant crop of poisons.—*Hume*.

From nature we possess no defect that could not become a virtue, and no virtue that could not become a fault.—*Goethe*.

\*Andres means "the other."

KINDERGARTEN FOR THE BLIND. Boston: Rand-Avery Company.

Somebody asked a foreigner to take venison. "No," said he, "I never eat venison."—"Oh!," said his friend, "I wonder at your saying so; if venison is not better than mutton why does venison cost so much more?"—"Vv? I tell you, vv; in dis verit de people always prefers vat is deer to vat is sheep."

A great eater, going to a dinner party, remarked to his entertainer that he had lost his appetite: "God be praised," said the host, "I only hope none of the company has found it."

## JUST PUBLISHED.

La philosophie religieuse en Angleterre depuis Locke jusqu'à nos jours, par Ludovic Carrau, Directeur des conférences de philosophie à la Faculté des Lettres de Paris (1 vol. in 8° de la bibliothèque de philosophie contemporaine. Paris: Félix Alcan, 1888.

L'auteur s'est proposé dans ce livre d'étudier les principales doctrines religieuses qui se sont succédées dans la philosophie anglaise depuis Locke et Clarke. Neuf chapitres sont ainsi consacrés à Berkeley, à la morale et à l'analogie de Butler, aux Déistes anglais, à David Hume, à Hamilton, à Stuart Mill, à Mr. Herbert Spencer, à Mr. Abbot.

L'exposition est exacte et complète, la discussion pénétrante. L'auteur, tout en se maintenant dans son rôle d'historien et de critique, ne s'interdit pas d'avoir une opinion motivée sur des problèmes dont aucun homme qui pense ne saurait se désintéresser. Il combat le scepticisme religieux de Hume, aussi bien que l'évolutionisme et la théorie de l'inconnaissable de Spencer, et dans une conclusion courte mais substantielle, il expose les raisons philosophiques qu'il croit avoir d'admettre un Dieu créateur et personnel; le style est toujours clair et permet de suivre aisément la pensée; sans rien dissimuler de la difficulté des problèmes, il en rend l'accès possible à ceux-là même qui n'ont pas fait des questions philosophiques l'objet exclusif de leurs études.

## The New and Beautiful Freethought Badge.

"A pin, whose torch and golden sheen  
Would grace the breast of Sheba's queen,  
And will lend grace in coming time  
To queens of beauty more sublime."

(From autograph letter, written by Hon. Eliza Wright, aged 81 years, eight days before his death.)

Design patented  
Feb. 24, 1885. Ex-  
act size and model.  
Warranted solid  
gold, artistic and  
beautiful, enameled  
in five colors.

Respectfully ded-  
icated to all inde-  
pendent and  
thoughtful minds of  
every shade of re-  
ligious, spiritual and  
scientific thought  
throughout the  
world.

Represents in artistically wrought gold and two shades of blue enamel FREE THOUGHT and the RISING SUN OF SCIENCE. The burning TORCH OF KNOWLEDGE vs. the NIGHT AND DARKNESS OF SUPERSTITION in black enamel and gold. Symbolizes the evolution of the world from the night of superstition to the light of freethought, science and reason.

Is made in two sizes, as above, and about two-thirds size. Both in pins, scarf-pins, sleeve-buttons, charms, etc. Charms combined on the reverse side with lodge emblems, U. S. L. Monograms, lockets, etc., if desired.

PRICES.—Large pins, 10¢, \$3; 14¢, \$3.50; 4¢, extra heavy, \$5; Small pins, 10¢, \$2; 14¢, \$2.75; extra heavy, \$3.75. For diamond in sun, add \$2 and \$5, according to size. Charms: small \$3 and \$5; elaborate, with ornamented top and diamond, \$2 to \$10; larger, \$5, \$8, \$10 to \$25. Special designs made to order. All guaranteed solid gold, and sent prepaid by mail, and cash refunded if not satisfactory.

# THE · OPEN · COURT

EDWARD C. HEGELER, President.

PUBLISHED BY THE OPEN COURT PUBLISHING CO.

DR. PAUL CARUS, Editor.

THE OPEN COURT is a fortnightly journal devoted to the work of conciliating Religion with Science. The founder and editor have found this conciliation in Monism—to present and defend which is the main object of *THE OPEN COURT*. It contains in its recent numbers:

**THE SPECIFIC ENERGIES OF THE NERVOUS SYSTEM,** . . . . . DR. EWALD HERING.  
*In Nos. 22 and 23.*

Ewald Hering, Professor of Physiology at the University of Prague—the same to whom the *Encyc. Brit.*, under the heading of Physiology, devotes several columns—presents in this essay, in most popular languages, the leading ideas in the recent investigations of physiology. His essay on Memory is contained in Nos. 6 and 7.

**THE EDUCATION OF PARENTS BY THEIR CHILDREN,** . . . . . CARUS STERNE.  
*In Nos. 22 and 23.*

An essay full of fine thought and psychological depth.

**THE FOOL IN THE DRAMA,** . . . . . FRANZ HELBIG.  
*In Nos. 22 and 23.*

Franz Helbig, an able scholar, whose attainments as an author on historical subjects, especially in the domain of the history of civilization, are much appreciated, contrasts in this article folly and wisdom and shows the philosophical significance of the fool as a character on the stage.

**EVOLUTION AND IDEALISM,** . . . . . PROF. E. D. COPE.  
*In No. 23.*

A very able statement of Positivism and scientific inquiry versus the imagination of a wrong Idealism. Prof. Cope treats this subject with perspicuity and strength.

**THE SOCIAL PROBLEM AND THE CHURCH,** . . . . . MORRISON I. SWIFT.  
*In No. 23.*

The author of this article asks the Churches to boldly face the problem of the day, and expects them to do their duty in the field of social reform.

**THE ETHICS OF ECONOMICS,** . . . . . GEO. M. GOULD.  
*In Nos. 24, 25 and 26.*

It will save us much distress if in political economy we begin with ethics instead of being driven to it by painful experience. Labor is the life-blood of man, and the ethical significance of money is that it represents labor. The author inculcates that labor and money paid for labor should be equivalent.

**THE PROCESS OF PROGRESS,** . . . . . RUDOLF WEYLER.  
*In No. 24.*

The problem of death treated in connection with the progress of evolution.

**LANGUAGE,** . . . . . E. P. POWELL.  
*In Nos. 24 and 26.*

This essay of the American scholar should be compared with the essays by Max Müller. The study of language is of interest to the lawyer as well as the clergyman, the scientist as well as the teacher.

**REFLEX MOTIONS,** . . . . . G. H. SCHNEIDER.  
*In No. 24.*

G. H. Schneider's book, *Der Menschliche Wille*, is one of the most prominent delineations of modern psychological research. The essay on Reflex Motion contains the fundamental propositions of physiological psychology.

**THE VALUE OF DOUBT IN THE STUDY OF HISTORY,** . . . . . GEN. M. M. TRUMBULL.  
*In No. 25.*

It will be interesting to the veterans of 1861-65 to read the article of their famous comrade. The essay of General Trumbull may serve as an introduction to the many war accounts and memoirs. Teachers can read the article with their students as an instructive lesson for historical research.

**DETERMINISM VERSUS INDETERMINISM,** . . . . . PROF. GEORG VON GIZYCKI.  
*In Nos. 25 and 26.*

George Von Gizycki is Professor of Philosophy at the University of Berlin. His name is well known beyond the boundary of his country. The problem of the Freedom of the Will has perhaps never been treated in a clearer and more forcible manner.

**TO ARMS, AND** . . . . . }  
**THE POETS OF LIBERTY AND LABOR,** . . . . . } WHEELBARROW.  
*In Nos. 22 and 26.*

Wheelbarrow has rapidly gained a well deserved reputation as an author. He treats the social question from the standpoint of a laborer and speaks from his own experience. He unites in his writings Old Saxon simplicity, sincerity of heart, the truthfulness of honesty and warm sympathy for justice and right.

**THE SIMPLICITY OF LANGUAGE,** . . . . . }  
**THE IDENTITY OF LANGUAGE AND THOUGHT,** . . . . . }  
**PERSONA,** . . . . . } MAX MÜLLER.  
*In Nos. 9-11, 12-14 and 19-20.*

Max Müller's essays must not only be read, they must be studied; and we should be very grateful that the eminent philologist uses so simple language. In spite of all the simplicity of Max Müller's style, it takes much careful study to fathom the depth of his thoughts.

Gustav Freytag's novel, *The Lost Manuscript*, commences in No. 22. Reference is made to the significance of this famous work of fiction in Editorial Notes of No. 22 and No. 26.

THE OPEN COURT's definition of Religion is found in a letter of Mr. E. C. Hegeler, published in No. 25, and in the editorial of No. 24, "Monism and Religion."

The editorial of No. 26, "Anarchism and Socialism," is an impartial and objective review of the social question.

The editorial of No. 25, "Evolution and Immortality," grapples with the problems of death and immortality in their mutual relation and proposes their solution by the evolutionary doctrine, as viewed from the standpoint of Monism.

## APHORISMS.

BY HENRY BYRON.

Religion is man's consciousness of his relation to the All. The truth that underlies all religions is manifested in love toward God and man.

Denominational differences are rifts in the oneness of humanity, clefts in the all-unifying religion of mankind.

As the sun is reflected in the tiniest dew-drop while giving light unto a world, so the grandeur of the All, while pervading the whole universe, is mirrored in every human heart.

God made man after his own likeness and after his own likeness hath every man made his God.

Many define the soul as the unintelligible in ourselves and God as the unintelligible in the universe. Others say, "There is no God, man has no soul." Need we add that both are wrong?

Man stands on earth, yet towers into the heavens. In him creator and creation meet. He is born of the world, yet is the son of God; every man is a demi-god, and the myth of divinity in man is immutable, universal and eternal.

There are sparks of divinity in every man's nature; yet, like the sparks of flint, they must be *struck* into life.

The conscience of a nation finds utterance in the words of its greatest men; and as there is no man that has not at some time violated the dictates of his conscience, so there is no nation that hath not at some time misjudged and execrated, persecuted and executed its legislators, its prophets, its benefactors and its teachers.

Jesus taught love and peace. He preached self-examination, severity unto oneself, indulgence toward others, hate of sin, pardon of sinners. He taught trust in God, incessant efforts to gather lasting treasures, and to scorn what is perishable. His prayer was no humiliation of self before a deity, but the discourse of a son with his father. He denounced injustice and hypocrisy, yet fell himself a victim to the blindness of the masses and the villainy of the wicked.

Men of mediocrity can espouse with ardor only the cause of *self*, never that of humanity. Selfishness is the atmosphere of their existence; in the realm of the ideal their vitality becomes benumbed.

Our mission in life is like unto the office of a Vestal Virgin, to keep perpetually burning within us the holy flame of divinity.

Of all the battles of our life the struggle with the evil within us is the fiercest and most fraught with danger; the victory of the good over the evil in us is the most glorious we can ever win.

The approval of the world is not always to be gained, but our own approval is always within reach. The world sees the results of our actions; we alone know their motives.

By stumbling and falling we come to know the path through life.

Be cautious in thy way through the fields of life; learn to know the poisonous plants and to find the useful and the good.

Every season of the year, every period of life, has its own peculiar and matchless charms; one can never decide which should be preferred.

There is a center of attraction in life, as well as in matter; how gleefully we approach it, how reluctantly we leave it!

There are events in our lives which are not fairly understood until we live them over again in our memories; just as in a thoughtful book there are passages that need repeated perusal for a thorough understanding.

To teach—to scatter seeds in youthful minds without ever being able to conjecture the abundance of blessings that may grow therefrom unto humanity—what a noble calling!

Not those that are called teachers teach the best; the words of the wise and the deeds of the noble are the educators of humanity.

What the world calls education is chiefly mere training; discipline makes skillful, culture elevates.

The better we are, the more satisfaction our conscience gives; the more temperate we are, the less trouble our body causes; and the more we reduce our wants, the greater our independence!

How enviable is the lot of a tree! Again and again spring returns, until its life is ended.

Wickedness is folly; the wicked man is an insane man; he injures himself as well as others.

Have nothing to conceal and you will enjoy the inestimable right of being always sincere.

Truth is like the sun; whatever darkens it is but a passing cloud.

If a truth declines in one part of the world it rises like the sun in another.

If always we speak the truth, our words will always bear an imprint that gives them currency.

Truth hits the mark; falsehood rebounds and strikes the marksman.

Ordinary men are like shallow cisterns. What little intellect and feeling they possess is never renewed. It is stale and soon exhausted. Great men are like deep wells. Their intellect and feeling are fed from never-failing sources; are ever fresh and inexhaustible.

With the multitude the shrewd pass for wise men, the wise for fools.

The words of a wise man are like unto jewels; the expert alone can appreciate their worth; the ignorant leave them unnoticed.

The truly great learn most from themselves and from the book of nature.

To the wise man the present is always the climax of life, whence past and future are alike visible.

However long the life of a wise man may be, 'tis yet short, and however short, it has yet been long enough.

Happiness lies within certain limits. In the ardor of pursuit, man easily overleaps these limits, and fancying himself still approaching his goal he is but getting farther and farther away from it.

Not only the world but we ourselves are too prone to judge of our virtues and capacities according as we succeed or fail.

A fool wants always to have people about him. It is quite natural that he should grow weary of his own company.

The primary conditions of health and happiness are within us; we have only to conform to them the secondary and accidental influences. With our health, we generally trust all to nature and too little to ourselves. With our happiness, we are too little mindful of the essential within, and pursue too eagerly the non-essential without.

We often impute to chance what is but the natural consequence of our own conduct.

Could we weigh the happiness of every man in the same scales, we should find that after all the gifts of fortune are not so unequally distributed.

The fountain-head of happiness is contentment of heart, which springs from the ascendancy of the good over the evil in us.

The best, the noblest deeds of man have been inspired by love—by love for a human soul or by love for mankind.

The determining principle in the spiritual is the same as that in the physical world: Love, the law of attraction.

## NATIONAL TAXATION.

BY AN ANTI-MONOPOLIST.

### Part II.

The national government of this country, as a matter of course, must receive from the American people a revenue amply sufficient to perform its duties under the Constitution and laws of the United States. Our American Constitution, as amended in consequence of our late civil war, speaks of the revenue of the government as follows:

"Representatives and direct taxes shall be apportioned among the several states which may be included within this Union according to their respective numbers, counting the whole number of persons in each state and excluding Indians not taxed."

"All bills for raising revenue shall originate in the House of Representatives; but the Senate may propose or concur with amendments as on other bills."

"The Congress shall have power to lay and collect taxes, duties, imposts, and excises to pay the debts and provide for the common defense and general welfare of the United States; but all duties, imposts and excises shall be uniform throughout the United States."

"No capitation or other direct tax shall be laid, unless in proportion to the census or enumeration herein before directed to be taken."

"No tax or duty shall be laid on articles exported from any state."

"No preference shall be given by any regulation of commerce or revenue to the ports of one state over those of another; nor shall vessels bound to or from one state be obliged to enter, clear or pay duties in another."

"No state shall, without the consent of the Congress, lay any imposts or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws; and the net produce of all duties and imposts laid by any state on imports or exports, shall be for the use of the Treasury of the United States; and all such laws shall be subject to the revision and control of Congress."

Both the present protective feature of the customs system and the whole internal revenue system of the United States are results and relics of our late civil war. They are not only unjust and illogical, but also dangerous to the material welfare of the American people, because they may create, as at present, a surplus, derived from them, in the Treasury of the United States, that is, large sums of the people's money uselessly locked up in the vaults of that office. The sums comprised in

such a surplus, for which the government has no use under existing laws, are prevented from circulating among the people for business purposes, and thus render money scarce in this country. A change, therefore, in our national taxation seems to be and is plainly necessary. Which shall it be? Can it not be a radical one?

From the clauses quoted above, it is to be seen that our American Constitution leaves it, within certain limits, to the option of Congress to determine the ways and means by which the revenue necessary for the support of our national government and for meeting its legitimate obligations, shall be raised. The customs, therefore, and the internal revenue may be completely abolished. Yet, which other tax or taxes shall take their places? It would not do to tax real and personal property also for national purposes, as they are taxed for State or local purposes, because they are not uniformly assessed, for taxation, in the several states and territories of the Union.

In the United States all taxes being paid in money, the most correct, natural and logical national tax of this country, seems to be one relating to the money or income of every American citizen or resident alien; namely, an *individual income tax*. Such a tax would be in full harmony with the Constitutional provisions quoted above.

Under such a tax every head of a family or other person in the United States having an income of his or her own, should, by law, be bound annually to pay a certain percentage of his or her *net* income, reaching a certain sum, for the support of our national government. From this tax all persons should be exempt, not having a *net* annual income of five hundred dollars, or of one thousand dollars, or of any other amount Congress might see fit to fix for this purpose. A man's *net* income consists of what he acquires by his business and from other sources, after deduction of all his business expenditures and of his state and local taxes. Personal or family expenses would, of course, be included in and could not be deducted from a *net* taxable income.

The percentage referred to should be uniform in all parts of the Union, for every taxpayer and for every dollar taxed. Thus, if, for instance, a net annual income of one thousand dollars would pay a tax of one dollar, a net annual income of two thousand dollars should pay a tax of two dollars, a net annual income of three thousand dollars a tax of three dollars, and so on. This would be a simple income-tax, increasing in arithmetical progression, and taxing every dollar of taxable incomes, high or low, alike. This would be the only just kind of an income-tax, under our American principle of equal rights for all, in all matters of public concern. A man with a larger net income claims and enjoys the protection of the government for it to a larger extent than a man with a smaller net income. For this reason, if the two incomes be taxable, the former should pay more

tax than the latter, but on a strictly and absolutely equal, uniform basis. A so-called graduated income-tax, increasing at a higher rate than the one stated and taxing a dollar of a higher taxable income higher than a dollar of a lower taxable income, would be a flagrant violation of the principle referred to and utterly wrong, robbing the few for the benefit of the many. It would punish men for being wealthy, which would be the silliest thing in the world. There are, it is true, men in this country with colossal fortunes, exceeding the bounds of reason and common sense. Yet, for this fact, not strictly those men are responsible or to be blamed, but our perverse American political economy. Those men are rather to be praised for their shrewdness, although not always for their philanthropy. The simple income-tax suggested, together with other measures to be mentioned presently, might somewhat affect those colossal fortunes, yet it could and would not eradicate the present Cæsars in the United States, who own their wealth legitimately. It might, however, help to prevent the growth of new ones. The richest men of this country being the railroad magnates, a few words may be devoted to them.

The railroads of this country, as a matter of course, are most excellent things and very useful to the American people. Yet, the private corporations owning them, have built them for the sole purpose of making money. For this reason, all the property in this country belonging to railroad companies, because it enjoys exactly the same local public protection as all other private property, should also be taxed as that other private property both for state or territorial or for municipal purposes. To such taxation also all unimproved land should be subject, held by railroad companies. Under the two fundamental laws of this country, the Declaration of Independence, which by the categorical dictum of a competent law-giving body has created the United States as a political division of the earth, and which is proclaiming the principle of equal rights for all, in all matters of public concern; and the Constitution of the United States, decreeing a Republican form of government for every state of the Union, no such state has a right to forego its paramount prerogative, namely that of taxation, in favor of private corporations, in the shape of railroad companies, and at the expense of all its other inhabitants.

Under the two fundamental laws named and particularly on account of its limited powers under the Constitution, Congress has no right to aid private companies in the construction of railroads by land grants and by public credit, although it has repeatedly exercised the *might* to do so. Any legitimate business, based upon private means, is, of course, commendable. Yet, no fair-minded man in this country will ever apply for government aid in his private business, because he is not entitled to it and would be unjustly benefited by

the same, at the expense of all his American fellow-citizens. If any man or any number of men would have a just claim to be aided by Congress, in a private undertaking, everybody in this country would have such a claim, namely, to be aided by Congress in his private business. Would not this be the greatest nonsense? If a railroad becomes necessary or desirable in any part of the Union, it should be built strictly with private means. Yet, if government means be employed for its construction, it should also be constructed in the name of and for the government, that is, the whole American people, and not in the name and for the account of private parties.

The Constitution of the United States contains two clauses relating to this subject. They read:

The Congress shall have power \* \* \* to regulate commerce with foreign nations, and among the several states, and with the Indian tribes; \* \* \* to establish post-offices and post-roads.

In pursuance of the former provision Congress has passed an interstate commerce law, being in operation now by means of a commission.

Under the latter provision Congress has plainly the power, in the name and for the account of the whole American people to build railroads, to be used as post-roads. It has also the power to grant, free of charge, the right of way over the public domain of the American people, to private parties, for the construction of railroads, to be used as post-roads. Yet, it has not the power, by land grants and by subsidies or financial help, to aid private corporations in the construction of railroads, serving in the main for the transportation of freight and of passengers, and only incidentally for that of the mail. Justice, fairness, and common sense admit no other interpretation of the passage quoted of our American Constitution. According to its preamble, this fundamental law by the following clause: "The congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States," plainly does not mean that Congress shall have power to donate the public domain of the American people to private corporations for speculative purposes. Congress, however, as mentioned before, has extensively aided railroad companies in the wrong manner stated, thus enabling a number of self-loving men to grow immensely rich at the expense of all their American fellow-citizens. Such companies not having been entitled to the government aid they have received, the small item of the right of way excepted, they are also not entitled to enjoy its profits in an unrestricted manner. In reality, to the full extent of that unjust aid, the whole American people may be considered as partners in such railroads. For this reason Congress doubtless has the right and power to control every railroad of this country that has been constructed

with government aid, as to the passenger fare and the freight rates to be charged by the corporation owning the road, and perhaps also as to the minimum wages to be paid by the company to their employees.

The foregoing principles, applying to railroads, with equal force and justice also apply to other private concerns, having been aided or seeking to be aided by the government. However excellent things and however useful to the American people they may be, yet Congress, under the fundamental laws of this country, has no right to aid private companies engaged in such concerns otherwise than by granting them, free of charge, the right of way over the public domain of the American people, provided such aid be of any use to such companies and of advantage to our national government. Under our American Constitution, Congress has absolutely no power to aid such private concerns by general land grants or by subsidies. Yet, after they have been established by private means, our national government is, of course, entitled to patronize them freely. Telegraph lines, to a certain extent, answering the same purpose as post-roads, Congress doubtless has the constitutional power to establish such lines in the name and at the expense of the American people. So much on this subject.

For the collection of the income-tax suggested, every person of age in the United States, having an income of his or her own, should, by law, be compelled at a stated time, perhaps between the first day of April and the thirtieth day of June, to declare, under oath, his or her *net* income during the preceding calendar year. If the person referred to be a minor, or otherwise legally incapacitated to do this himself, the taking of the oath and the paying of his income-tax would have to be attended to by his guardian. As a kind of perfunctory act, the percentage of all taxable net incomes, to be levied as income-tax, would have to be fixed by Congress, annually, as soon as possible after its meeting, in December, according to the requirements of the government for the current fiscal year (ascertained by the sum total of the appropriations, including those relating to the public debt made by Congress during its preceding session), and according to the total amount of taxable net incomes reported by the national revenue officers throughout the country, charged with the collection of the income-tax. This tax should then be collected perhaps during the time from the date, when the percentage referred to would have been fixed, to the thirty-first day of March. If such a tax be adopted for this country, Congress, to avoid embarrassments of the United States Treasury, would have to see to it, that during the first six or perhaps nine months of the fiscal year, in which this tax would be collected for the first time, the necessary revenue of the National government would be raised yet in the old way.

In fact, according to the plan suggested, one-half, or another sufficient portion, of the income-tax collected during a fiscal year, would have to be used by our national government during the first six months of the next fiscal year. Such a course, as to the time of fixing the rate of the income-tax and of collecting and disbursing this tax, would become necessary, because every other year there is a short session of Congress, ending on the fourth day of March. This state of affairs, however, could be easily changed, if, by a Constitutional amendment, both the term of a Congress and that of the Presidency and Vice-Presidency of the United States would commence on the first day of July, instead of on the fourth day of March. In case of the adoption of such a constitutional amendment, all the taxable net incomes, throughout the United States, could be annually ascertained, as suggested, from the first day of January to the thirty-first day of March, and if Congress would timely make its appropriations for the succeeding fiscal year, it could also annually fix the required percentage of all the taxable net incomes, for the income-tax, by the thirtieth day of June, the close of the fiscal year. Then the collection of this tax for the new fiscal year could be commenced on the first day of July and be ended by the thirty-first day of December.

Special items of income in the United States Treasury, for instance those from the sale of public lands, would have to be annually deducted from the sum total of the income-tax required for government expenses. A fitting annual period for making this deduction could be easily enacted by Congress. On account of possible business failures of tax-payers between the time when the net incomes would be declared under oath and the time when the income-tax would be collected, Congress, in its discretion, would have to fix the percentage referred to somewhat higher than it would have to be according to a strict arithmetical division. That our national government might not be embarrassed in its operations, for want of funds, caused by the non-payment of such an income-tax, Congress would have to pass the strictest laws for enforcing its prompt payment. Any person's frivolous and willful refusal to state a net income under oath or affirmation, or to pay the income-tax, might be punished even with imprisonment.

The abolition of our American customs system and the adoption of a national income-tax might perhaps not benefit some overgrown manufacturing establishments in this country. Yet, these measures would doubtless call forth numberless smaller manufacturing establishments—perhaps on a co-operative plan—in different parts of the Union, which fact would be a blessing to the whole American people.

There are those who say that a national income-tax would cause a good deal of perjury in this country. Yet, it is *the* American tax that, if permanently estab-

lished, would soon render the American people truthful as to its payment. The truthfulness of a free nation can be affected only by erroneous legislation, in favor of classes of the people, but never by a just, sound, and uniform tax for the support of a government of the people, by the people and for the people, as our national government, and also every American state and municipal government, happily is this.

Both the interest on and the bonds of our American public debt being payable in gold, a correct solution of the silver question would doubtless have to precede the adoption of a national income-tax for this country. Correct silver dollars, being on a par with gold coin as to their bullion value, would cause gold coin to circulate as freely in this country as silver coin, and thus enable our national government to derive from a national income-tax the necessary amount of gold coin for meeting its gold obligations.

As George Washington, the "Father of his Country," "first in war, first in peace, and first in the hearts of his countrymen," in his Farewell Address, truly says, "honesty is always the best policy," both in the public and private life of the American people.

#### THE SIGNIFICANCE OF MATTER AND FORCE IN THEIR RELATION TO GRAVITY.

Every conception of the world which is not consistent must, in the end, prove dualistic. If it pretends to be monistic, its logical consequence, if developed to the utmost, will lead to dualism. It is generally recognized that spiritualism is dualistic, and the advocates of supernaturalism frankly confess their dualism. But also materialism is just as dualistic as its antagonistic view. If the world is to be explained from dead matter, the force of logical argument leads us to assume some unknown force beyond or behind matter, and materialism will change into agnosticism.

One of the most important questions is that of the cause of gravity. Two solutions are possible: Either the force of attraction is immanent, it lies within—or it is external, it lies without matter. Either matter *attracts* matter, or matter *is pushed* toward matter. Either matter is in self-motion, or it *is* moved. If matter is dead we are obliged to resort to the latter solution. But if we accept the former solution, we must consider self-motion as an ultimate property of matter. If matter is inert and deprived of force we must assume that there is some other substance besides matter. The world then consists first of matter and secondly of ether—or whatever the pushing *agens* outside of the dead matter may be called.

The solution of the problem of gravity is not yet definitely settled; but we wish to inform our readers of the present state of the subject and shall therefore present two essays on the ultimate properties of matter, one of which is published in this number.

Le Sage's theory is perhaps the most consistent the-

ory' of a kinetic or mechanical explanation, which almost seems satisfactory from the standpoint of materialism. Wilhelm Stoss thinks that Le Sage's theory is much strengthened by Falb's hypothesis of earthquakes; and as he presents and states the problem so clearly and so correctly in an essay published in the *Gegenwart*, a translation of it was procured for THE OPEN COURT. In the next number of THE OPEN COURT we shall publish an essay by J. G. Vogt, which treats the subject from another standpoint, which he calls "Monism of Reality" (*Real-Monismus*).

We reserve our judgment, as we believe that the problem is not yet mature. Many other questions must be answered before we can, with any hope of success, approach the problem of gravity, and we present the attempts made to explain the cause of gravity as what they are, ingenious hypotheses. P. C.

#### FALB'S THEORY OF EARTHQUAKES AND LE SAGE'S THEORY OF GRAVITATION.

BY WILHELM STOSS.

*Translated from the German in the Gegenwart by F. W. Morton.*

The recognition which Falb's theory of earthquakes has met is largely due to his conclusions that the origin of earthquakes is attributable to cosmical causes. That the sun is for our planet the source of existence and life, and, likewise, that the phenomena of ebb and tide are principally expressions for lunar influence, there can be no doubt. It immediately follows that a similar influence is exerted on the molten mass in the interior of the earth. It is the proof of such an influence that Falb has sought to deduce beyond a question in his theory of earthquakes.

It is a peculiarity of human inquiry that whenever a forward step has been taken in the knowledge of things, a question is raised as to the new facts revealed. When we have answered one "Why" another immediately suggests itself. Herein lies the deep truth of Haller's words: "Into nature's mystery of mysteries no human spirit can press." For instance, if we regard earthquakes as but a manifestation of the attractive power which the sun and moon exert upon the earth, the new question immediately arises: How can the sun and moon act in this way upon the earth? What is the original cause of this action? This question is in no wise a new one. At times an answer to it has been attempted in different ways; and then again, as lying beyond the scope of human inquiry, no answer has been ventured.

There are two theories of nature which directly oppose each other, the dynamic and the atomic. The former explains the reciprocal action between the spheres by a force simply, without the intervention of a material medium; the latter maintains the existence of such a medium, which fills the universe and produces the reciprocal action of the spheres by transmission of motion. Furthermore, opinions have differed widely in

respect to the nature of this medium. These systems are designed rather to explain attraction on earth than universal attraction.

From Leucippus and Democritus to the present day one atomic system after another has sprung into being. Leucippus, Democritus and Plutarch assumed, as the original cause of attraction, vast, simple rotatory motions of the atoms. To this assumption reverted, in a later day, Kepler, Torricelli, Gassendi, Descartes, Huygens and others. Malebranche and Euler, on the other hand, interposed small rotatory motions within the great; Jean Bernoulli assumed light as a medium; Gautier, electricity; Micheli, magnetism; Wallis, Le Cat, De la Rive and others, common air; and so forth. Newton did not apply himself earnestly to the task of investigating the causes of universal attraction. "*Nam multa me movent, ut nonnihil suspicer* \* \* \* *quibus viribus cognitis philosophi hactenus naturam frustra tentarunt*," says he in the preface to his "Principia." The first to extend this theory to universal attraction, and especially to the attraction between sun, earth and moon, was Le Sage. Of him there is but little known, since only a few fragments of his numerous manuscripts have been published. This explains why he is so little known to kindred modern scientists, many of whom have entirely erroneous notions of his theory. Take up the latest theories of Schramm, Thomsen, Zöllner, Von Dellingshausen, Isenkræhe and others; either the theory of Le Sage is not mentioned at all, or only casually and incorrectly.

Le Sage was born on July 23, 1724, at Geneva, and died there on November 9, 1803. He studied medicine and natural science at Basel and Paris, and then lived to the end of his life in his quiet retreat at Geneva. There, too, in the *Bibliothèque Publique* his manuscripts are preserved; they are in the same order as Le Sage with his own hands arranged and left them. They are filed away in fifty large wooden boxes, and comprise, besides a few connected discourses and loose leaves, little paper sacks with numbers and titles. The sacks contain playing-cards on which Le Sage had jotted down the results of his investigations. The greatest part of the manuscripts are devoted to his atomic theory of mechanical physics. The gist of his theory, the system of *corpuscules ultramondaines*, is briefly as follows:

In limitless empty space imagine an infinite number of atoms, which are separated from one another by large intervals. These atoms move in straight lines and in all directions with uniform and enormous rapidity. They pervade all space, far beyond the limits of the visible universe; they come and go, as it were, from one world to another. Take any one point in space. At every moment a multitude of atoms will come to it from all directions and again pass away from it in all directions,

so that for the moment every point of space may be regarded as the center of innumerable atoms. The atoms are uniform and homogeneous, hard and *inelastic*—completely isolated material points. Their form is spherical. The rapidity of the aggregate atoms, moreover, is equal to the density of the stream formed by them. This is extremely slight, since the atoms are so small, relatively to their mean distances from one another, that two atoms very rarely can meet and disturb the uniformity of their motions. In comparison with any known rapidity, their rapidity is infinitely great, so that the atoms, in spite of the enormous distances between them, form an unbroken, continuous stream. A body plunged in this will remain immovable, since the atoms acting with equal force on all sides will keep it in equilibrium. If a second body be placed at a certain distance from the first, the two will approach each other, because the one serves the other as a sort of shield, and the atoms whose action is no longer exerted on the opposing sides produce a constant motion.

Every particle of matter in space must thus be taken as a central point for enormous spheres that are filled with atoms. Matter must be regarded as so porous that, for instance, the earth can only stop an insignificant portion of the atoms which penetrate it. Moreover, no atoms can lodge upon a solid body. For, since most of the atoms do not strike the solid body in a perpendicular, but in a slanting direction, the atom loses every time as much of its perpendicular velocity as it imparts to the body; and on account of its perfect hardness it glances off at a tangent from spherical masses.

Of the atoms whose central point forms a solid, the same number penetrate all surfaces of the spheres described concentrically about it. These spherical surfaces are proportional to the squares of the radii, therefore to the squares of the distances of these surfaces from the mass-center. The density of the stream of atoms at the different distances, or the effects of the impacts with which the atoms strike the bodies they meet about the mass-center, are therefore inversely proportional to the squares of the distances. Furthermore, taking into consideration that all bodies are extremely porous, so much so, indeed, that the atoms are infinitely small in comparison with the pores, we can readily see that only an extremely small number of atoms will be checked; and of these the number that affect the first and the last layers will be about the same. Their action, then, on a body or a sphere is proportional to its mass.

Thus Newton's law, *a priori*, appears as a consequence of this system. Kepler's laws may be proved a necessary result of Newton's. Moreover, even the laws of Galileo may be deduced from it. As the atoms all possess infinitely great and uniform rapidities, so also they follow each other at exactly equal periods. By the impact of an atom a body receives a certain velocity in

a definite direction; the next atom following from the same direction produces the same effect as the preceding; and so, successively with all atoms following in the same line. The effect, being the result of an infinitely rapid succession of exactly equal impacts, may be regarded as continuous. It follows, therefore, that the successive velocities must be proportional to the impacts, and hence comes directly this law which Galileo first indirectly deduced from experiments: The distances are to each other as the squares of the times.

Now let us look at the connection between this theory of Le Sage's and Falb's theory of earthquakes. Falb calls the times at which earthquakes are under especially favorable constellations tide-factors. He distinguishes six such tide-factors, to wit:

1. The greatest proximity of the earth to the sun, on the 1st of January. At this time the attraction of the sun is the greatest; while on the 1st of July, the time of greatest remoteness, it is the least.

2. The greatest proximity to the moon. At this position of the moon, which it attains once during its revolution of twenty-seven days, its attraction is likewise the strongest.

3. Conjunction and opposition of the moon—that is, the times of new and full moon. At these times moon, earth and sun, or more accurately their projections, form nearly a straight line, so that their powers of attraction are united; while at the time of the quadrants, i. e. at the time of the first and last quarters, their powers of attraction have a tendency to destroy each other.

4. Eclipses of sun and moon. The three planets form exactly a straight line, and the attractive powers of the sun and moon are combined. This factor comprehends the preceding.

5. The position of the sun over the equator whereby its attractive power is augmented by the centrifugal force of the earth, revolving upon its axis. The centrifugal force at the equator is greatest; at the poles it is zero.

6. The position of the moon over the equator.

The more tide-factors unite their influences, the greater is the probability of an earthquake occurring.

According to Le Sage, the atoms converge toward the center of the earth. They become attenuated, and consequently a constant falling of the moon toward the earth takes place. This is in reality the case, since otherwise the moon would fly off at a tangent. Now, the atoms which keep impelling the moon toward the earth become so attenuated that the part of the earth lying under the moon is assailed by a smaller number of atoms. The consequence of this will be that the fluid masses on and in the earth will have a tendency to rise toward the moon. The molten mass in the interior of the earth will press with the greatest force against the hard crust of the earth in the direction of the moon.

If the molten mass finds channels and cavities that have been formed by the gradual hardening of the earth's crust, it will rise in the former, pour into the latter and exert such a powerful pressure on the overlying layer that a concussion will be felt on the surface of the earth. The stronger the attractive power acts upon the mass, the more easily can it rise and find its way to a volcanic cavity. This attractive power, however, is commensurate with the attenuation of the atoms. If this be increased either by the moon or by the sun, i. e. if tide-factors 3 and 4 come into play, an upheaval of the earth's crust is the more probable. Further, since the atoms converge toward the center of the earth, the greater the proximity of this center to the moon or sun (tide-factors 1 and 2) the greater will be the attenuation of the atoms. It easily follows that these attenuations are inversely proportional to the squares of the distances of the moon and sun from the earth.

The strengthening influence of factors 5 and 6 is rather of terrestrial than of cosmical origin.

Le Sage's theory assumes as the cause of attraction between sun, earth and moon, not a force of attraction, an *actio in distans*, but a pushing material, a *vis a tergo*. This theory is an hypothesis yet to be proven. Should it meet favor at a later day, as Falb's theory of earthquakes now does, still the last "Why" would not be answered. The question as to the cause of atomic motion and the principle of motion itself would require its new and probably never-to-be-given answer.

#### THE HISTORICAL DEVELOPMENT OF THE FAMILY.

BY TH. ACHELIS.

*Translated from the German by F. W. Morton.*

Under the comprehensive perspective of all the peoples of the earth, furnished by modern ethnology, one of the most interesting problems of history is the development of the family. The early idyllic conception of a patriarchal, though often very oppressive, community of life; the broader social organization of the tribe in the coherence of several families; and, finally, the political union, variously described as to particulars but always conceived as an ideal consummation;—all these must go. Such a theory of political formation, based as it is on very limited data, cannot meet the stubborn facts which ethnology in ever greater measure is bringing to light.

As so often happens, not only in life but in the history of science, those things which were formerly derided as silly fables which should have been utterly rejected—the so-called absurd reports of otherwise well-accredited authors—have received through the unquestionable finds and discoveries of modern travelers and observers a surprising and often not over-welcome *restitutio in integrum*. For the accomplishment of this

there was also the exceedingly effective methodical means, which, however, is only to be used with care, by which E. Tylor has already reached so many important conclusions—the survivals, the characteristic remains, which clearly show in the usages and customs of nations the complete differentiation of any one idea together with the entire morphological structure of its development. As an illustrative example, taken at random, we may cite the well-known custom of the Roman father respecting his newly-born child; the significant act of taking it up from the threshold is nothing more than a later, unintelligible relic of the old right of exposure and killing in barbaric times.

As has been said, at the beginning of social life (for it is only with this and not with a completely-formed, separate existence of man that ethnology has to do) the family and marriage did not exist in our sense and our moral estimation; rather, there was a strange state of affairs, wholly opposed to our current notions. This was the original peaceful association of families, which is found among all peoples of the earth at the same primitive stages—an apparently chaotic and disunited horde of individuals, incapable of observing rights, and resting wholly on community of descent or blood unity. Allegiance to the band or union was conditioned by the most natural of all bonds—descent from the same tribal mother. Every one lacking this qualification stood outside the protecting organization, and, being a stranger, was *eo ipso* an enemy. This entire union was represented by the central position of woman. There was no recognition of individual rights or duties; but each, without further question, was held answerable for the others. Thus, for instance, a murder was not always revenged on the murderer himself, but on some member of the tribe to which he belonged. Indeed, so strong was the thought of consanguinity that in all questions of inheritance the person of the man steps wholly into the background.

In order to form a tolerably accurate idea of this, nothing is more instructive than a glance at the organization of the Malays in respect to property, as it has heretofore been studied, especially by Dutch scholars. According to their view no real relationship exists between the father and his children, but only between him and his brothers and sisters. He is not, in our sense of the term, the father and adviser of his offspring; he but belongs, after his marriage as before it, to the family circle in which he was born. Here is his real home; hither comes his inheritance; while his children, wholly independent of him, grow up and acquire their rights in the sphere of the mother. (v. Post, *Grundlagen des Rechts*, Oldenburg, 1884, Seite 92 ff.)

According to the view hitherto accepted, the family formed the foundation of society, in extension from tribe to nation, and so forth; and at its head, in the Aryan

civilization, appeared the *paterfamilias*, philologically explained as "protector." Now, when, with ethnological insight, we reach the primary foundations, the family, as such, falls out entirely; and the *femina finis familie* rises in the dim distance to grace the family as its *materfamilias*. We must at the outset obviate a misconception. The question, in this period of female autocracy, is, of course, not so much one of woman's political supremacy—an impossibility for those prehistoric times of rude culture—but of the organization of those apparently chaotic masses as they came together in an association of relatives. This resulted exclusively or, at least, largely in matriarchal principles; in that the tribal mother likewise represented the original source of the whole social organization. Consequently the entire question of inheritance (in so far as one may speak of its early beginnings in a communistic body) regulated itself according to consanguinity on the female side.

Nevertheless, many proofs may be found of the comparatively high estimation in which woman was held in the most different nations. Indians, Africans, Malays, and other tribes are zealous even exclusively to accord this precedence to her in many religious ceremonies; and Nachtigal relates of the scattered Solimans of North Africa that in spite of the depressing influence of Mohammedanism the women enjoy a certain political influence. (v. Lippert, *Culturgeschichte*, II, 92 ff.)

Now, as long as the children belong to the mother, they are subject in matters of property to the jurisdiction of one of her relatives, usually her brother, as their natural protector; and even though they are grown up they likewise belong to the mother's family. Thus, as Bastian remarks, it may happen that in case of war the child fights against his own father. This possibility, moreover, has a wide and, morally speaking, highly significant meaning, in that it brings out sharply the great difference between our moral perceptions and the corresponding views of these primordial stages.

Further, the current view, according to the patriarchal foundation of the family, makes the feelings that prevail between parents and children, and especially between a father and his offspring, take root in every normally formed individual with a certainty at once irresistible and ideal. This, on the impartial witness of comparative ethnology, is wrong. This feeling, which to us seems so self-evident ("*natura nobis insita*," as the Stoic would say), is rather a comparatively late product of a long and, for the most part, prehistoric development—a development which first took its deep moral significance when the patriarch laid the foundation of the ethical view of the world by emphasizing the immediate relation of all the family members to their representative head.

The ethical view to us seems the only right and natural one. How the transformation was brought

about in individual instances is not yet clearly known; but at all events the firmer consolidation of habits after the adoption of a permanent residence had no inconsiderable part in it. The destruction of the original family assemblies, consequent upon this, resulted in the district organization. Especially significant, moreover, was the purchase of the wife, who thereby lost her former sphere and was subjected to the authority of the husband.

If we judge of this process strictly according to our moral code we cannot fail, in this disgraceful treatment of woman as a chattel in political intercourse, to perceive a shocking crudeness of feeling, and that, too, though we bear in mind the slow moral progress instituted by the patriarchal organization. For us of German education, and especially in our youth, this course has robbed the idyllic scenes of the Old Testament of their pleasure. Even though these subjective emotions spring from a comparatively broad ground, as, for instance, national consciousness, it is well not to treat them without further question as objective criticisms, as absolute moral principles of unconditioned and universal application and necessity. From the historical point of view this development appears as an advance in ethical progress. No age with its ethical ideas should be judged from the standpoint of the present, but should be estimated by its own conditions.

#### TO DEATH.\*

Refuge from envy's fierce pursuing,  
And limit to our self-undoing;  
Pruner of Time, that lopp'st decay  
And fruit-defeating growth away;  
Vintner, that from his purpled vine  
Crushest for heaven's sacred wine,—  
E'en when the sweetest cup were quaffing,  
When life within the heart is laughing,  
When our great peace doth seem a river  
That well might fill the full Forever,  
When the rich day makes Hope a debtor,  
And Wish himself can wish no better,  
E'en then thy offices appear  
More worthy welcome than a tear;  
For well we know our golden hours  
Are deep indebted to thy powers;  
No light of life, nor smile benign,  
But half its luminance is thine;  
No gift from heaven our hands receive,  
But thou dost help the heavens to give.  
Thy sateless hunger feeds our bliss,  
Our sun would pale thy shade to miss.

Men contend with one another in punching and kicking; but no one shows any emulation in the pursuit of virtue.—*Diogenes*.

\* Selected from *Poems by David Atwood Wasson*. Boston: Lee & Shepard; 1888.

## BOOK REVIEWS.

## A DISSERTATION ON THEISM OR ON THE KNOWABILITY OF GOD.

By Henry Truro Bray, M. A., LL.D., Rector of Christ Church, Boonville, Md.

This pamphlet of about ninety pages contains more than its unpretentious appearance gives reason to expect. It is written in a scholarly manner, and is teeming with well-applied quotations from the ancient Grecians, the sacred books of the East, the early fathers, and from the foremost leaders of modern thought and science. The time and care spent in collecting these numerous passages must have been enormous.

The conclusions the author arrives at remind one of the theism of Mr. F. E. Abbot. Mr. Bray's theism is not the belief of old—a dogmatical belief in a supernatural Deity. He proposes as follows:

There is an Infinite Intelligence whom we call God.

Man is by nature a religious being.

All religions have in them a nucleus of truth.

No religion is exclusively true, or founded upon an exclusively divine Revelation.

From the last two pages we quote the following sentence:

"First the egg, then the helpless young crying for succor, then the fledgling trying to fly, then the full-grown bird soaring aloft in the vaulted blue—this is the history of all religious growth. It shows the expansion of the soul-atom from the state of unconscious heavenly tendency to the dignity of a soul flooded with divine light, of a heart beating with divine energy. Evolution proves that the Man of Nazareth must have come in due time, when the old religions had lost their virtue for the time and place, the intellect having outgrown them. It proves that the teaching of Christ is true, because in essential agreement with the teachings of all great moral and religious reformers or instructors. As the old form of a religion, its shell becomes too narrow, then by the strivings of the intellect after higher knowledge, and the yearnings of the soul after God, there comes, according to the laws of Evolution, that knowledge of God which is needful for the time and place. Nature is not at a loss in supplying the things wanting, whether for the soul or the body. The principles of Evolution, when applied to the development of religions, discover to us the fact that religion, everywhere present, everywhere moving the soul by similar impulses onward to the same common end, is a natural result of human development under the laws of nature, which is another name for the universally present and uniformly operating Deity, and, therefore, Evolution proves that religions in their essence must be true."

It is a pity that the quotations from the Greek are printed in English letters. It makes their reading troublesome to the scholar, whose eye is accustomed to see Greek words in Greek characters, whereas it can afford no help whatever to one unacquainted with the language. We would advise the author, in an eventual future edition, to have these quotations put into Greek characters entirely and to affix English translations of them. It would greatly increase the value of the book, as it would become more available for the scholar as well as for the public at large.

## NOTES.

The American Folk-Lore Society, which has for its object the study of Folk-Lore in general, and in particular the collection and publication of the Folk-Lore of North America, was recently organized at Cambridge, Mass. The study of Folk-Lore received its first impetus at the time when Jacob Grimm first made his collection of German *Märchen*. The American Folk-Lore Society numbers among its members the most prominent scholars

in all parts of the country. The society has made arrangements with Messrs. Houghton, Mifflin & Co. to publish a quarterly journal, which will no doubt be full of instructive matter. As both the usefulness and the success of such a society depends very largely on the number of its members, and the membership fee is only three dollars a year, it is to be hoped that all who in any way feel interested in the study of folk-lore will join the American Folk-Lore Society. Address W. W. Newell, Cambridge, Mass.

Those of our readers interested in the subject will readily recall the delightful article entitled, "Folk-Lore Studies," by Mr. L. J. Vance, in Nos. 22 and 23 of THE OPEN COURT.

The translation of Goethe's poem on page 782 in THE OPEN COURT is the revision of an unpublished version by N. F., which reads as follows:

"Nature's secret depths,"

Phyllistine, sayest thou,

"From mortal mind

Must ever be concealed?"

To me and to my kind

Repeat this not. We trow,

Where'er we are, that we

In nature's depths must be.

"Thrice-blessed he to whom

Even her outer shell's revealed."

For sixty years I've heard this o'er and o'er,

And in my secret soul condemned it heartily,

Say unto myself repeatedly:

Nature gladly gives of all her store;

She knows not kernel, knows not shell,

For she is all in one; but thou,

Examine thou thine own self well,

To see whether kernel thou be'st, or shell.

We commend the following editorial from a recent number of *The Medical and Surgical Reporter* of Philadelphia to the attention of our readers, feeling sure that it will meet with their approval:

## QUACK ADVERTISEMENTS IN RELIGIOUS NEWSPAPERS.

From time to time medical men and medical journals have protested against the prostitution of the columns of religious newspapers to the use of advertisers of quack nostrums. This protest does not apply to temperately worded representations of what seems to have been accomplished by, or what may reasonably be expected of, a remedy or device for the cure of disease or injury. But it does apply to advertisements couched in language which bears the stamp of falsehood on its face, or which is of such a character as to arouse suspicion in the mind of an intelligent man, uninfluenced by a money consideration.

The editors of most religious journals are, as a rule, men of so much intelligence that they will hardly attribute to trade-jealousy alone the objection which medical men have to the recommendation of "sure cures" for baldness, fits, rupture, consumption, and so on, to persons who are apt to regard their religious teachers as safe guides in matters of health or disease; and who are not sufficiently familiar with the subtleties of the newspaper business to distinguish between the responsibilities of the editor and those of the publisher. As a fact, most readers of periodicals have the impression that the advertisements they contain are endorsed by the editor. Advertisers rely upon this fact; and we cannot understand the casuistry which satisfies the conscience of a man who edits a periodical, ostensibly devoted to religion, which replenishes its coffers with the price of palpable falsehoods.

If it were true that a religious paper could not be financially successful without taking money for the advertisement of worth-

less or delusive remedies, a course might be suggested worthy of the main object of these papers. But it is not true; for there are a few happy illustrations of the fact that, even in a religious newspaper, 'honesty is the best policy.'

"We call the attention of our large circle of readers to this matter, in the hope that they will use their influence to put an end to what we regard as a serious blemish in religious newspapers and one which injures the good reputation which they ought to enjoy. And we call the attention of those religious newspapers to which our remarks may apply to this matter, in the hope that we shall not have to recur to it in a more explicit manner."

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

#### CHAPTER VII.—*Concluded.*

Laura looked up astonished from the hideous dogs to the unexpected visitor, who came toward her with dignified steps.

"I come to complain, young lady!" began Frau Hahn, without further greeting. "The insults that have been heaped upon my husband from this house are insupportable. For your father's conduct you are not responsible; but I think it shocking that a young girl like you should also join in these outrages!"

"What do you mean, Madame Hahn?" asked Laura, excitedly.

"I mean the affront of giving a man's name to dogs. You call your dogs by all my husband's names."

"That I have never done," replied Laura.

"Do not deny it," cried out Frau Hahn.

"I never speak an untruth," said the maiden, proudly.

"My husband's name is Andreas Hahn, and what you call this beast is heard by the whole neighborhood."

Laura's pride was roused. "This is a misunderstanding, and the dog is not so called. What you say is unjust."

"How is it unjust?" returned Frau Hahn. "In the morning the father, and in the afternoon the daughter, call him so."

A heavy weight fell on Laura's heart; she felt herself dragged down into an abyss of injustice and injury. Her father's conduct paralyzed her energies, and tears burst from her eyes.

"I see that you at least feel the wrong that you are committing," continued Frau Hahn, more calmly. "Do not do it again. Believe me, it is easy to pain others, but it is a sorry business, and my poor husband and I have not deserved it of you. We have seen you grow up before our eyes; and even though we have had no intercourse with your parents, we have always been pleased with you, and no one in our house has ever wished you ill. You do not know what a good man Hahn is, but still you ought not to have behaved so. Since we have dwelt here we have experienced many vexations from this house; but that you should share your father's views pains me most."

Laura endeavored in vain to dry her tears. "I repeat to you that you do me injustice; more I cannot say in self-justification, nor will I. You have grieved me more than you know, and I am satisfied that I have a clear conscience."

With these words she hastened into the house, and Frau Hahn returned home, uncertain as to the result of her visit.

Laura paced up and down her little room wringing her hands. Innocent and yet guilty in spite of her good will, wounded to the quick, dragged into a family feud, the unhappy results of which could not be foreseen, she reviewed the events of the past day in her excited mind. At last she seated herself at her little writing-table, took out her journal, and confided her sorrows to this silent friend bound in violet leather. She sought comfort from the souls of others who had borne up nobly under similar griefs, and at last found the confirmation of her experience in the expressive, well-known passage of Goethe's *Faust*:

"Reason doth folly, good doth evil grow;

The child must reap the mischief that the fathers sow."

Had she not wished to do what was reasonable and kind, and had not folly and evil arisen from it? and had not misfortune befallen her without her fault, because she was a child of that house? With this sentence she closed a passionate effusion. But in order not to appear to her conscience devoid of affection, the poor child wrote immediately underneath these words: "My dear, good father." Then she closed the book, feeling more comforted.

But the severest humiliation to her was the feeling that she would be judged unjustly by the people over the way; and she folded her arms and thought how she could justify herself. She, indeed, could do nothing; but there was a worthy man who was the confidant of every one in the house, who had cured her canary bird when ill, and removed a stain from the nose of her little bust of Schiller. She resolved, therefore, to tell only to the faithful Gabriel what Frau Hahn had said, and not a word to her mother unless obliged to do so.

It happened that toward evening Gabriel and Dorchchen entered into conversation in the street. Dorchchen began to make bitter complaints of the spitefulness of the Hummels, but Gabriel earnestly advised her to this effect: "Do not allow yourself to be dragged into these disputes. There must be some neutrals. Be an angel, Dorchchen, and bring peace and good will into the house; for the daughter is innocent." Whereupon the history of giving the name was spoken of, and Laura honorably acquitted.

Then, when Gabriel, a little later, incidentally remarked to her: "This matter is settled; and Herr Hahn has said that it had at once appeared to him improbable that you should be so ill-disposed toward him,"

—a heavy weight fell from her heart, and again her soft song sounded through the house. And yet she did not feel satisfied, for the annoyance to the neighboring house caused by her father's anger still continued. Alas! she could not restrain that violent spirit, but she must endeavor secretly to atone for his injustice. She pondered over this while undressing late at night; but when in bed, after entertaining and rejecting many projects, the right idea suddenly struck her; she jumped up at once, lighted her candle, and ran in her night-dress to the writing-table. There she emptied out her purse, and counted over the new dollars that her father had given her at Christmas and on her birthday. These dollars she determined to spend in a secret method of reparation. Highly pleased, she took the precious purse to bed with her, laid it under her pillow, and slept peacefully upon it, although the specter dogs raged round the house in their wild career, horribly and incessantly.

The following morning Laura wrote in large, stiff characters, on an empty envelope, the name and dwelling of Herr Hahn, and affixed a seal on which was the impression of a violet with the inscription, "I conceal myself," and put it in her pocket. On her way to town to make some purchases she stopped at a hot-house, the proprietor of which was unknown to her. There she bought a bushy plant of dwarf orange, full of flowers and golden fruit—a splendid specimen of the greenhouse; she carried it with beating heart in a close cab, till she found a porter, to whom she gave an extraordinary gratuity, and bade him leave the plant and envelope at the house of Herr Hahn without word or greeting of any kind.

The man performed the commission faithfully. Dorchon discovered the plant in the hall, and it caused an agreeable excitement in the Hahn family—fruitless imaginations, repeated inspection, and vain conjectures. When at noon Laura peeped through the vine arbor into the garden she had the pleasure of seeing the orange plant occupying a distinguished place in front of the white Muse. Beautifully did the white and gold of the shrub glitter across the street. Laura stood long behind the vine branches, unconsciously folding her hands. Her soul was unburdened of the injustice, and she turned from the hostile house with a feeling of proud satisfaction.

Meanwhile, there was a police complaint and legal suit pending between the two houses, which was seriously increased on that very day by the adoption of the dogs' names "Fighthahn" and "Spitchahn."

Thus the peace in house and neighborhood was still disturbed. At first the pealing of the bells had excited public opinion against Herr Hahn, but this was entirely altered by the introduction of the dogs: the whole street went over to the man of *straw*; the man of *felt* had all the world against him. But Herr Hummel cared little

for this. In the evening he sat in the garden on the upturned boat, looking proudly at the neighboring house, while Fighthahn and the other dog sat at his feet blinking at the moon, who in her usual way looked down maliciously on Mr. Hummel, Mr. Hahn, and all the rest of the world.

It happened on the following night that amidst the barking of dogs and moonshine all the bells were torn down from the temple of Herr Hahn and stolen.

#### CHAPTER VIII.

##### TACITUS AGAIN.

Our people know that all lost things lie under the claws of the Evil One. Whoever seeks anything must call out: "Devil, take thy paw away." Then it suddenly appears before the eyes of men, it was so easy to find; they have gone round it a hundred times; they have looked above and below, and have sought it in the most improbable places, and never thought of the nearest. Undoubtedly it was so with the manuscript; it lay under the clutches of the Evil One or of a hobgoblin, quite close to our friends; if they were to stretch out their hands they might lay hold of it; the acquisition was only hindered by one consideration, by the question, Where? Whether this delay would involve more or less suffering for both the scholars was still doubtful. Nevertheless, they might overcome even this uncertainty; the main point was, that the manuscript really existed and lay somewhere. In short, the matter stood on the whole as well as possible; the only thing wanting was the manuscript.

"I see," said the Doctor to his friend, "that you are strenuously exerting yourself to educate the older people. I put my hopes in the souls of the younger generation. Hans, the eldest, is very far from sharing the views of the father and sister; he shows an interest in the old treasure, and if we ourselves should not succeed in making the discovery, he will at some future period not spare the old walls."

In conjunction with Hans, the Doctor secretly resumed his investigations. In quiet hours, when the proprietor was unsuspectingly riding about his farm, and the Professor working in his room or sitting in the honeysuckle arbor, the Doctor went prying about the house. In the smock-frock of a laborer, which Hans had brought to his room, he searched the dusty corners of the house high and low. More than once he frightened the female servants of the household by suddenly emerging from behind some old bin in the cellar, or by appearing astride of one of the rafters of the roof. In the dairy a hole had been dug for the forming of an ice-pit; the laborers had gone away at noon, and the mademoiselle passed close to the uncovered pit, suspecting nothing. There she beheld, suddenly, a head without a body, with fiery eyes and bristly hair, which

was slowly groping along the ground and turned its face to her with a mocking laugh. She uttered a shrill cry and rushed into the kitchen, where she sank fainting on a stool and was only revived by the sprinkling of water and encouraging words. At dinner she was so much troubled that every one was struck by it, and at last it appeared that the devilish head was to be found on the shoulders of her neighbor, who had secretly descended into the hole in order to examine the masonry.

On this occasion the Doctor discovered, with some degree of malicious pleasure, that the hospitable roof which protected him and the manuscript from rain stood over an acknowledged haunted house. There were strange creakings in the old building; spirits were frequently seen, and the accounts only differed as to whether there was a man in a gray cowl, a child in a white shirt, or a cat as large as an ass. Every one knew that there was in all parts a knocking, rattling, thundering, and invisible throwing of stones. Sometimes all the authority of the proprietor and his daughter was necessary to prevent the outbreak of a panic among the servants. Even our friends, in the quiet of the night, heard unaccountable sounds, groans, thundering noises and startling knocks on the wall. These annoyances of the house the Doctor explained to the satisfaction of the proprietor by his theory of the old walls. He made it clear that many generations of weasels, rats and mice had bored through the solid walls and laid out a system of covered passages and strongholds. Therefore every social amusement and every quarrel which took place among the inmates of the wall were made perceptible in muffled noises. But the Doctor listened with quiet vexation to the secret noises of his wall-neighbors; for if these blustered around the manuscript so excitedly, they threatened to render difficult the future investigation of science. Whenever he heard a violent gnawing he could not help thinking they were again eating away a line of the manuscript, which would make a multitude of conjectures necessary; and it was not by gnawing alone that this colony of mice would disfigure the manuscript that lay underneath them.

But the Doctor was compensated by other discoveries for the great patience which was necessary under these circumstances. He did not confine himself to the house and adjoining buildings; he searched the neighborhood for old popular traditions which here and there lingered in the spinning-room and worked in the shabby heads of old beldames. Through the wife of one of the farm-laborers, he secretly made the acquaintance of an old crone well versed in legendary lore in the neighboring village. After the old woman had recovered from her first alarm at the title of the Doctor and the fear that he had come to rebuke her on account of incompetent medical practice, she sang to him, with trembling voice, the love songs of her youth, and related to him

more than the hearer could note down. Every evening the Doctor brought home sheets of paper full of writing and soon found in his collection all the well-known characters of our popular legends—wild hunters, devilish hags, three white maidens, many monks, some shadowy water pixies, sprites who appeared in the story as artisan lads, but undeniably sprang from a merman; and finally many small dwarfs. Sometimes Hans accompanied him on these excursions to the country people, in order to prevent these visits from becoming known to the father and daughter. Now, it is certainly possible that here and there a hole in the earth or a well in the field might be provided with spirits without any foundation; for, as the wise women of the village observed how much the Doctor rejoiced in such communications, the old inventive power of the people awoke from a long slumber; but, on the whole, both parties treated each other with German truth and conscientiousness; and, besides, the Doctor was not a man who could easily be taken in.

Once when he was returning to the castle from such visits he met the laborer's wife on a lonely foot-path. She looked cautiously about and at last acknowledged that she could impart something to him if he would not betray her to the proprietor. The Doctor promised inviolable secrecy. Upon this the woman stated that in the cellar of the castle, on the eastern side, in the right-hand corner, there was a stone, marked with three crosses; behind that lay the treasure. She had heard this from her grandfather, who had it from his father, who had been a servant in the castle; and at that time the then Crown Inspector had wished to raise the treasure, but when they went into the cellar for that purpose, there had been such a fearful crash and such a noise that they ran away in terror. But that the treasure was there was certain, for she had herself touched the stone, and the signs were distinctly engraved on it. The cellar was now used for wine, and the stone was hidden by a wooden trestle.

The Doctor received this communication with composure, but determined to set about investigating by himself. He did not say a word either to the Professor or to his friend Hans, but watched for an opportunity. His informant sometimes herself carried the wine which was always placed before the guests, to the cellar and back. The next morning he followed her boldly; the woman did not say a word as he entered the cellar behind her, but pointed shyly to a corner in the wall. The Doctor seized the lamp, shoved half a dozen flasks from their places and groped about for the stone; it was a large hewn stone with three crosses. He looked significantly at the woman—she afterward related in the strictest confidence that the glass shields before his eyes shone at this moment so fearfully in the light of the lamp, that she had become quite terrified—then he went

silently up again, determined to take advantage of this discovery on the first opportunity in dealing with the proprietor.

But a still greater surprise awaited the Doctor; his quiet labor was supported by the deceased Brother Tobias himself. The friends descended one day to Rossau, accompanied by the proprietor, who had business in the town. He conducted his guests to the Burgomaster, whom he requested to lay before the gentlemen, as trustworthy men, whatever old writings were in the possession of the authorities. The Burgomaster, who was a respectable tanner, put on his coat and took the learned men to the old monastery. There was not much to be seen; only the outer walls of the old building remained; the minor officials of the crown dwelt in the new parts. Concerning the archives of the council the Burgomaster suggested the probability that there would not be much found in them; in this matter he recommended the gentlemen to the town clerk, and himself went to the club in order, after his onerous duties, to enjoy a quiet little game of cards.

The town clerk bowed respectfully to his literary colleagues, laid hold of a rusty bunch of keys, and opened the small vault of the city hall, where the ancient records, covered with thick dust, awaited the time in which their quiet life was to be ended under the stamping machine of a paper mill. The town clerk had some knowledge of the papers; he understood fully the importance of the communication which was expected from him, but assured them with perfect truth that, owing to two fires in the town and the disorders of former times, every old history had been lost. There were also no records to be found in any private house; only in the printed chronicles of a neighboring town some notices were preserved concerning the fate of Rossau in the Thirty Years' War. After that, the place had been a heap of ruins and almost uninhabited. The town had since continued without a history, and the town clerk assured them that nothing was known here of the olden time, and no one cared about it. Perhaps something about the town might be learnt at the capital.

Our friends continued to walk unweariedly from one clever man to another, making inquiries, as in the fairy tale, after the bird with the golden feather. Two little gnomes had known nothing, but now there remained a third—so they went to the Roman Catholic priest. A little old gentleman received them with profound bows. The Professor explained to him that he was seeking information concerning the ultimate fate of the monastery—above all, what had happened in his closing years to the last monk, the venerable Tobias Bachhuber.

"In those days no register of deaths was required," replied the ecclesiastic. "Therefore, my dear sirs,

I cannot promise to give you any information. Yet, if it is only a question of yourselves, and you do not wish to extract anything from the old writings disadvantageous to the Church, I will show you to the oldest of the existing books." He went into a room and brought out a long thin book, the edges of which had been injured by the mold of the damp room. "Here are some notices of my predecessors who rest with the Lord; perhaps they may be useful to the gentlemen. More I cannot do, because there is nothing else of the kind existing."

On the introductory page there was a register of the ecclesiastical dignitaries of the place in Latin. One of the first notices was: "In the year of our Lord 1637, and in the month of May, the much venerated brother Tobias Bachhuber, the last monk of this monastery, died of the plague. The Lord be merciful to him."

The Professor showed the passage silently to his friend the Doctor, who wrote down the Latin words; they then returned the book with thanks and took leave.

"The manuscript still lies in the house," said the Professor, as they went along the street. The Doctor thought of the three crosses and laughed quietly to himself; he had in no way assented to the tactics which his friend thought fit to adopt for the discovery of the manuscript. When the Professor maintained that their only hope rested on the sympathy which they might by degrees awaken in their host, the Doctor entertained the suspicion that his friend was brought to this slow way of carrying on the war not by pure zeal for the manuscript.

The proprietor, however, maintained an obstinate silence concerning the manuscript. If the Doctor threw out any hint upon the subject, the host made a wry grimace and immediately changed the conversation. It was necessary to put an end to this. The Doctor now determined to insist upon a decision before his departure. When, therefore, they were sitting together in the garden in the evening, and the proprietor was looking cheerfully and calmly on his fruit trees, the Doctor began the attack:

"I cannot leave this place, my hospitable friend, without reminding you of our contract."

"Of what contract?" inquired their host, like one who did not remember it.

"Regarding the manuscript," continued the Doctor, with emphasis, "which lies concealed in this place."

"Indeed! why you yourself said that every place sounds hollow. So we would have to tear down the house from roof to cellar. I should think we might wait till next spring, when you come to us again; for we would be obliged, under these circumstances, to live in the barns, which now are full."

"The house may, for the present, remain standing," said the Doctor; "but if you still think that the monks

took away their monastic property, there is one circumstance which goes against your view. We have discovered at Rossau that the worthy friar, who had concealed the things here in April, died of the pestilence as early as May, according to the church register; here is a 'copy of the entry.' "

The proprietor looked at the Doctor's memorandum book, closed it and said: "Then his brother monks have taken away the property."

"That is scarcely possible," replied the Doctor, "for he was the last of his order in the monastery."

"Then some of the city people have taken it."

"But the inhabitants of the town abandoned it then, and the place lay for years desolate, in ruins and uninhabited."

"Humph!" began the proprietor, in good humor; "the learned gentlemen are strict creditors and know how to insist upon their rights. Tell me straightforwardly what you want of me. You must, first of all, point out to me some place which appears suspicious, not only to you, but also to the judgment of others; and that you cannot do with any certainty."

"I know of such a place," answered the Doctor, boldly, "and I wish to suggest to you that the treasure lies there."

The Professor and the proprietor looked on him with astonishment.

"Follow me into the cellar," cried the Doctor.

A candle was lighted; the Doctor led the way to the place where the wine lay.

"What gives you such victorious confidence?" inquired the Professor, on the way, in a low voice.

"I suspect that you have your secrets," replied the Doctor; "permit me to have mine."

He actively removed the bottles from the corner, threw the light on the stone, and knocked on the wall with a large key.

"The place is hollow and the stone has a peculiar mark."

"It is true," said the proprietor; "there is an empty space behind it; it is certainly not small. But the stone is one of the foundation stones of the house, and has not the appearance of ever having been removed from its place."

"After so long a time, it would be difficult to determine that," rejoined the Doctor.

The proprietor examined the wall himself.

"A large slab lies over it. It would, perhaps, be possible to raise the marked stone from its place." He considered for a moment, and then continued: "I see I must let you have your own way. I will thus make compensation for the first hour of our acquaintance, which has always lain heavy on my conscience. As we three are here in the cellar like conspirators, we will enter into an agreement. I will at once do what I consider

to be very useless. In return, whenever you speak or write upon the subject, you must not refuse to bear testimony that I have given in to every reasonable wish."

"We shall see what can be done," replied the Doctor.

"Very well. In the stone quarry at the extremity of my property I have some extra hands at work; they shall remove the stone and then restore it to its place. Thus, I hope, the affair will be forever settled. Ise, early in the morning let the shelving be removed from the wine-cellar."

The following day the stonemasons came, and the three gentlemen and Ise descended into the cellar, and looked on curiously while the men exerted their power with pickaxe and crowbar on the square stone. It was placed upon the rock, and great exertions were necessary to loosen it. But the people themselves declared that there was a great cavity behind, and worked with a zeal that was increased by the repute of the haunted house. At last the stone was moved and a dark opening became visible. The spectators approached—both the scholars in anxious suspense; their host and his daughter also full of expectation. One of the stonemasons hastily seized the light and held it before the opening. A slight vapor came out; the man drew back alarmed.

"Within there lies something white," he cried, full of fear and hope.

Ise looked at the Professor, who with difficulty controlled the excitement that worked in his face. He grasped the light, but she kept it from him, and cried out, anxiously, "Not you." She hastened to the opening and thrust her hand into the hollow space. She laid hold of something tangible. A rattling was heard; she quickly withdrew her hand; but, terrified, threw what she had laid hold of on the ground. It was a bone.

## GOETHE AND THE DEVELOPMENT HYPOTHESIS.

BY PROFESSOR CALVIN THOMAS.

"Men there are whose patient minds,  
In one object centered,  
Wait till through their darkened blinds  
Truth has burst and entered.

\* \* \* \* \*

Men there are whose ambient souls,  
In rapt Intuition,  
Seize Creation as it rolls,  
Whole, without partition." —J. C. Maxwell.

The merits of Goethe as a man of science, and more especially his relation to the evolutionary theories of our day, are subjects that have lately been attracting, in Germany at least, a considerable amount of attention. Virchow, Haeckel, Helmholtz and Du Bois-Reymond, not to mention names of less repute, have all contributed to the discussion, and, their writings having called forth more or less opposition, quite a body of literature has grown up about the question whether Goethe, who was so many other things, was or was not an evolutionist in the modern sense of the term.

The disagreement of very competent authorities upon this subject might appear surprising were not the disagreement of doctors on almost every conceivable subject such a very familiar fact of human experience. Many years ago Helmholtz stated his conception of the matter thus:

"To Goethe belongs the great glory of having first foreseen the leading ideas toward which the sciences of organic nature were tending and by which the subsequent development of those sciences has been determined."\*

Haeckel, in an address before the fifty-fifth Congress of German Naturalists and Physicians, rates the scientific merits of Goethe very high, declaring that he can see "no essential difference" between Goethe's philosophy of Nature and "our modern monistic philosophy as re-established by Darwin."† On the other hand Du Bois-Reymond, in a now famous address delivered upon assuming the rectorate of the University of Berlin in 1883, takes the ground that Goethe's mental endowment was, for a man of science, fatally defective in one important particular, namely, the sense for mechanical causality;

that his views were essentially different from the Darwinism of to-day; that what he did and thought in a would-be scientific way was at best of little moment and would not be missed if it were obliterated from the history of scientific thought. In short, Du Bois-Reymond would have the world remember that the poet Goethe was a man of science in precisely the same spirit as it remembers that King Frederick the Great was a poet.\*

It is not my purpose to enter upon the discussion of this subject in a controversial spirit, or to urge opinions of my own with regard to the value of Goethe's scientific ideas. What I shall try to do is rather to make clear, historically and from the documents, what the ideas in question really were, so far as they are related directly or indirectly to the development hypothesis. It might seem perhaps as if a mere exposition of any views of Goethe must be at this date superfluous, but I hardly think that such is really the case. Personally I incline to the opinion that the general position of Du Bois-Reymond as outlined above is not altogether unsound, and I seem to discern among the admirers of Goethe a tendency to overestimate the importance of their hero in the history of science. But, on the other hand, I cannot doubt that the opposite error of rating him too low is still more common. Especially, as I judge, do inadequate conceptions prevail with regard to the real range and character of his evolutionary speculations. And these conceptions conduce not simply to an imperfect, but to a really wrong, understanding of the man.

For Goethe's scientific thinking cannot be regarded as something apart from and independent of the remainder of his intellectual existence. His mind was not one of air-tight compartments, but one in which each new range of ideas speedily interfused with and formed one whole with all the rest. We may, perhaps, make a partial exception to this remark in case of the *Farbenlehre*. Though he himself attached such supreme importance to his "Theory of Colors," yet it is, as a matter of fact, possible to think all that away from his life and still have Goethe left. But this is not the case with his views upon the general subject of development, which are intimately bound up with all that is most characteristic of the man. For any philosophical purposes it is impossible to separate the poet from the scien-

\**Populäre Wissenschaftliche Vorträge* Erstes Heft, Braunschweig, 1876, p. 37. The quotation is from a lecture delivered in 1853.

\**Goethe und sein Ende*. Leipzig, 1883.

tific thinker, and to extol the one while disparaging or ignoring the other. It is possible, of course, to maintain that the poet Goethe would not have suffered in the least if he had never meddled with the "dead work" of research. But even this proposition appears to me debatable in spite of his well-known ineptitude\* for dead work; even if admitted it would mean simply that his ideas are more interesting than his arguments. Such people there are and always have been in the world, and it will not do to treat them with disrespect because of this peculiar characteristic. In fact the class is strongly represented among the intellectual patricians of the human race.

Goethe's pursuit of scientific studies began with mineralogy; for we may leave out of the account his slender acquirements at the university and his later dabbling in physiognomic speculations under the auspices of Lavater. It was in 1776 that he first took his seat as a member of the Ducal Council in Weimar and almost the first official responsibility committed to his charge was the superintendence of certain mining operations in Ilmenau. The interests involved were not large, but they were important enough to the mind of Goethe so that, with the conscientiousness which was a part of his nature, he at once set vigorously about the study of mineralogy, which, however, soon came to interest him chiefly through its bearing on the broad questions of geological theory. We learn from his journal and correspondence how eagerly he applied himself to this new pursuit. He visits all the nooks and crannies of the little State in order to study their geological features.† He commences a collection of minerals and endeavors to communicate his new enthusiasm to his friends. Wherever he goes we find him knocking at the rocks and returning laden with treasures. "I am now living body and soul in rock and mountain," he writes Sept. 8, 1780, "and am delighted with the broad prospects that are opening before me."‡ By 1782, as we learn from a letter to Merck, he begins to feel something of self-assurance with regard to his knowledge of geology. Shortly after this botany and comparative anatomy begin to claim a portion of his attention, but his interest in the former study continues unabated. In 1784 he makes a journey to the Harz mountains and keeps what he calls a "geognostic diary"§ of his travels. He prints nothing, however, until 1807, after which we have from his pen a considerable number of short contributions to geological literature. These contributions are

of different kinds; some are mere notes, others are book-reviews and still others are descriptions of the geological features of the Karlsbad region and other localities which he had especially studied. The only interest they have lies in the incidental deliverances they contain with regard to geological theory.

Right at the beginning of his studies Goethe had accepted the doctrine of Werner that granite is the foundation of the earth and that other formations are always of later origin, having been superimposed upon the granite in the form of deposits from a primeval ocean or a chaotic *menstruum*. This theory he soon came to look on as impregnable, and thus granite acquired for him a quite peculiar sentimental interest. In letters of the period he refers to himself as a "friend of granite" and a fixed belief in the primordial character of that rock established itself as an underlying assumption in all his speculations concerning the sculpturing of mountain-masses. There is a curious fragment of his, written probably in 1784, but only in recent years made public\*—a bit of a prose ode to granite:

"Sitting on a high and naked peak," so runs a portion of the piece, "and gazing over a wide expanse, I can say to myself: Here thou reposest immediately upon a foundation which reaches down to the deepest places of the earth. No recent layer, no heaps of *débris* washed together by the water, have ever deposited themselves between thee and the firm ground-floor of the primeval world. Here thou dost not, as in those beautiful and fruitful valleys, walk over a continual grave; these peaks have never begotten and never swallowed up any living thing; they are before all life and above all life."

With such ideas in his head as the basis of all geological wisdom, Goethe naturally sided with the Neptunists when the great controversy of the last century broke out. The evidence seemed to him conclusive that Nature's process in the shaping of the hills had been a quiet and leisurely process. To this conviction he clung tenaciously through life and finally gave it emphatic expression in the second part of *Faust*:

"Als die Natur sich in sich selbst gegründet,  
Da hat sie rein den Erdball abgeründet,  
Der Gipfel sich, der Schluchten sich erfreut,  
Und Fels an Fels und Berg an Berg gereiht;  
Die Hügel dann bequem hinabgebildet,  
Mit sanftem Zug sie in das Thal gemildet.  
Da grünt's und wächst's, und um sich zu erfreuen,  
Bedarf sie nicht der tollen Strudelreien."†

Goethe was fond of working to its utmost capacity the thought that had once taken possession of him, and so it suited his bent to expand this geological doctrine

\*Goethe did not deceive himself on this subject. Under date of July 20, 1787, he writes from Rome of his two "capital faults." Einer ist dass ich nie das Handwerk einer Sache die ich treiben wollte, lernen mochte. . . . Der andere, nach verwandte Fehler, ist dass ich nie so viel Zeit auf eine Arbeit oder Geschäft wenden mochte, als dazu erfordert wird.—Goethe's *Werke*, XXXV., 366, Hempel edition.

†Letter to Merck, Oct. 11, 1780.

‡Letter to Frau von Stein.

§First published in 1877 in Part XXXIII. of the Hempel Edition of Goethe's *Works*, p. 438 ff.

\*Werke XXXIII., p. 92 ff.

†Werke XIII., 177. In Bayard Taylor's translation:

"When nature in herself her being founded,  
Complete and perfect then the globe she rounded,  
Glad of the summits and the gorges deep  
Set rock to rock, and mountain steep to steep,  
The hills with easy outlines downward moulded  
Till gently from their feet the vales unfolded,  
They green and grew; with joy therein she ranges,  
Requiring no insane, convulsive changes."

into the comprehensive idea that Nature's *characteristic* *modus operandi* is *always* quiet and leisurely—a method of gradual transformation without breaks and without barriers. This idea, fortified doubtless by the study of Spinoza, then became one of the ruling conceptions of his life; it furnished him with a starting-point for scientific study, with a rule of conduct and a maxim for judging the actions of men. What application he made of it in the realm of plant and animal morphology will presently appear. He wrote *Meister* to exhibit the gradual transformation of a human character under the attritions of experience. He hated the Revolution because it was a sudden and violent upheaval. In short, reverence for the method *ohne Hast aber ohne Rast* became the key-note of his character.

Like the rest of the Neptunists, Goethe, of course, could but be aware that volcanoes and earthquakes are facts in Nature; he contended, however, that such agencies must always have been what they appear to be at any particular epoch, namely, something sporadic and exceptional. His conception, curious as it appears when stated, seems to have been that violent commotions were not a part of Nature's process, but rather interruptions of it. In 1788 Werner claimed an igneous origin for basalt, and Goethe regarded the case as made out. Some of the *Xenia* are at the expense of the Vulcanists, whose cause he regarded as lost beyond the possibility of retrieval. It was therefore a source of infinite mental disturbance to him when, in the early part of this century, catastrophic theories, more or less similar to those advocated by Hutton, began to win influential friends. The new views, as accepted by Von Buch and Von Humboldt in Germany and by De Beaumont in France, ran counter to his inveterate prejudice. It was like telling him that mother Nature was after all unsteady and subject to freaks. The matter interested him very deeply; it is often referred to in his letters and prose writings, and is woven into the fabric of the second part of *Faust*.<sup>\*</sup> In *Faust* each side of the controversy is presented by its appropriate champion, but the Vulcanist doctrine is given by the poet a slight tinge of burlesque and persiflage, whereas that of the Neptunists is obviously intended to be taken *au grand sérieux*. The colloquies in *Faust* are serene enough, but the poet could not always maintain his serenity when dealing with this subject. In an oft-quoted passage, written not long before his death, he exclaims:

Be the case as it may, it must be written that I denounce this accursed racket and lumber-garret of the new order of creation (i. e., the noisy argument of those who would make of Nature's orderly work an unregulated rubbish-chamber). Surely some young man of genius will arise who will have the courage to oppose this crazy unanimity.†

This bold and confident prediction from an octogenarian poet is rather striking as a token of the man's character, but it becomes still more striking when we recall that at the very time when these words were being penned by the irritated Altmeister, the "young man of genius" was at his work. Sir Charles Lyell's famous book, which ushered in the modern era of "bit by bit" geology, appeared first in 1830.

The great controversy of a hundred years ago has now only an historical interest; there are to-day, so far as I am aware, neither Neptunists nor Plutonists. The modern discovery of the conservation of energy, the general acceptance of the nebular hypothesis and the resultant conceptions with regard to the life of the earth have made much of the older speculation untenable. The ideas of Goethe were very different from those of to-day. But while this is true, it is interesting to note how much nearer he stood than even the greatest of his contemporaries to the conceptions of the present time. He had started from a false theory and much of his reasoning was in its detail wrong, but so excellent were his powers of observation and interpretation, and so perfect was his intellectual balance, that he was able to reach conclusions which were in the main sound, and to anticipate, as Helmholtz says, the leading ideas of the coming era.

But was not this anticipation largely fortuitous? Was it not a coincidence which was thus and might have been otherwise? That it was not so, but rather an honest triumph of the scientific imagination, appears probable when we pass from the general to the particular and consider, for example, his prevision of the coming importance of paleontology and his theory of a glacial epoch. "The growing importance of the history of organic remains," writes Sir Charles Lyell, "may be pointed to as the characteristic feature of the science (of geology) during the present century." In view of this fact particular interest attaches to a letter of Goethe to Merck, written October 27, 1782. In this letter the writer sets forth his theory as to how the bones found in the alluvial plains of Germany came to be there, and argues that they belong to a recent epoch which is, however, in comparison with our ordinary computation of time, "prodigiously remote." He then adds this sentence: "*The time will come when people will no longer jumble together organic remains, but will arrange them with reference to the world's epochs.*"

This may seem a small matter, hardly worth the emphasis of italics. And so it is from one point of view; Goethe did not follow up the idea himself, and nothing came of it so far as he was concerned. But it is somewhat remarkable that at this date such a thought should have been in his mind at all, since it does not seem to have been in any one else's. Cuvier and William Smith were boys of thirteen, and the older geolo-

<sup>\*</sup> The passages occur in the *Classical Walpurgis Night Scene* and at the beginning of Act IV. Werke XIII., 103 ff. and 176 ff.

† Werke XXXIII., p. 466.

gists, regarding their science as the handmaid of biblical orthodoxy, were content to see in fossil remains at once the work and the evidence of the Noachian deluge. Back of the flood they did not care to go. So that Goethe's isolated idea begins to appear like a mental achievement of some dignity—an appearance which becomes more marked when we recall what nonsense a man of genius like Voltaire could still think and write on the subject of organic remains.\*

Goethe's relations to the glacier theory may be briefly described. He early speculated more or less upon the erratic boulders of Germany, and in time seems to have accepted the theory of his friend Voigt that they had been floated in from the North upon icebergs in the days of the primeval ocean. Toward the close of his life, however, we find him in possession of another theory, to the effect that anciently, at a time when North Central Europe was covered with water to a depth of—say a thousand feet, an epoch of great cold (*grosser Kälte*) had set in and that the phenomena of glacial action had then manifested themselves on a large scale in Germany. This idea is first recorded in *Wilhelm Meister's Wanderjahre*, in a passage which is known to have reached its present shape in 1829.† It is also formulated in an essay entitled "Geological Problems and their Solutions," first printed in 1833.‡ Thus we see that Goethe was dreaming of primeval ice fields at least a decade before Agassiz, attracted by the work of Charpentier, built his lone hut on the Aar glacier and commenced the series of investigations which resulted in opening up so many a new vista in modern geology. Both Charpentier and Agassiz acknowledged the priority of Goethe in this line of speculation.

(To be concluded.)

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY. §

BY FELIX L. OSWALD, M. D.

Part II.

##### RACE INFLUENCES.

The innate character-traits of individuals are biased by the sum of ancestral experience, and the same factor determines the moral characteristics of nations. "Blood will tell" in tribes and races as well as in families. A predisposition to deeds of violence has more than once been traced to a long lineage of moral outlaws. There have been dynasties of headstrong, lion-hearted rulers and dynasties of fox-kings. A penchant for mysticism,

\* In one of his essays Voltaire attempts to revive a hypothesis of the sixteenth century to the effect that the marine shells found in inland Europe were "sports of nature." He also thought, or pretended to think, that the plant impressions found upon rocks were not made by genuine plants—*pierres figurées* was his name for the phenomenon. Elsewhere he remarks that the bones of a reindeer and a hippopotamus found near Etampes did not prove, as some would have it, that Lapland and the Nile were once on a tour from Paris to Orleans, but merely that a lover of curiosities had preserved them in his cabinet.—Quoted by Lyell, *Principles*, Amer. Ed. of 1853, p. 55.

for bigotry, and even for suicide, has often tainted a long series of generations; and it is no accident that at certain periods of the world's history we find whole groups of nations launching their destiny on the stream of intellectual freedom, while others remain anchored to the shoals of dogmatic conservatism. A fertile soil may stimulate the industry of one race and encourage the indolence of another. There are incurably servile nations and nations whose love of independence will assert itself in spite of all obstacles.

Race-experience is the key to the secret of such contrasts. The bears of our Western Territories were more than a match for the bow-armed Indian, and still attack every intruder of their hunting-grounds with a recklessness that will lead to their ultimate extinction; and the same hardihood of aggressive valor has often characterized the politics of special, numerically perhaps inferior, nations, whose forefathers had acquired the habit of cutting every knot with the edge of the sword. The Asiatic ancestors of the Turks, for instance, had for ages been able to hold their own against every aggressor of their highland pastures, and their descendants are still strangely prone to right every wrong by summary methods of physical force. They loathe the shifts of diplomacy which the logic of circumstances urges upon their statesmen; their pride aggravates the penalties of defeat; they refuse to conciliate their rebellious subjects by prudent concessions; yet, withal, they have the virtues of their faults. Like the Turkoman chieftain who would bully all neighboring princes, but scorn to count the pennies of their tribute, the modern pasha, with all his jealousy of prestige, detests the details of red tape, and in times of need is ever ready to maintain his honor at the expense of his purse.

His moral antipode is the descendant of a race which in its mother's milk has imbibed the lessons of adversity and learned to deprecate the truculence of the victor by ready submission. Cunning and duplicity are the defences of the weak and may become hereditary character-traits as hard to eradicate as a penchant for violent self-help. The East-Indian ancestors of our Gypsies were harassed by the insolence of superior races till they learned to obviate trouble by avoiding the neighborhood of their oppressors and roaming the by-ways of the wilderness. They became vagrants, and remain vagrants even in countries where homesteads might be had for the asking. Moreover, an instinctive, rather than clearly conscious, desire to "cover their tracks" makes them apt to misrepresent their intended march-route and otherwise prevaricate without apparent cause, or even where candor would seem to serve their purpose much better. The hereditary influence of slavery appears to transmit similar character-traits, and the most phenomenal case of innate duplicity in my experience was that of a twelve-year old negro boy, doing chores

for a Texas lawyer of my acquaintance. "I can professionally appreciate a first-class fib," said his master, "but that young colleague seems to labor under the impression that prevarication is its own reward. A successful fiction stimulates him like a moral triumph, even if it costs him a dozen collateral fictions. He tells the truth only as a last desperate expedient."

Subjected nations of a more intellectual type are apt to resent oppression by commercial sharp-practice. The dwarfs of Norse mythology avenge their wrongs by outwitting their burly despoilers, and the triumphs of mercantile strategy formed the moral, as well as material, support of the trafficking Greeks under the sway of Moslem despotism, as of the trafficking Hebrews under the yoke of mediæval fanaticism, and thus laid the foundation of a race tendency which centuries of freedom may fail to eliminate.

There is a curious analogy in the moral phenomena of individual and national decrepitude. Young men of a normal constitution are natural optimists. A feeling of exuberant vitality inspires them with an almost misfortune-proof cheerfulness of temper; they never question the value of life and are too happy in the enjoyment of a present existence to waste much time with speculation on the prospect of a better hereafter. At the approach of old age, however, that constitutional joyousness gradually yields to the development of an instinctive pessimism. Disappointment, or mere satiety, produce that feeling of world-weariness by which Nature seems to reconcile the evening of life to the prospect of the long night, and which, by the influence of enervating excesses or under the weight of special grievous afflictions, may often assert itself at a comparatively early age. Worn-out debauchees and faded flirts are apt to become prematurely pious. Doomed criminals renounce the vanities of a world they are about to leave with the assistance of the county sheriff. From the anguish of a hopeless day the soul turns naturally to the solace of sleep—with or without the prospect of a brighter morning; and the grief of departure is blunted by the depreciation of the forfeited blessings. Worn-out nations, too, console themselves by withdrawing from the arena of international competition that has ceased to offer them a hope of success. They become stolid; they blunt the sting of defeat by renouncing ambition; they blunt the stigma of physical degeneration by suppressing the instincts of manhood. Their yearning turns from the scenes of life to the hope of a better beyond—the peace of the grave and the visionary joys of the spirit-world. Hence the physical apathy of degenerate nations; hence also their instinctive partiality for the doctrine of renunciation, and the rapid spread of Buddhism among the decrepit nations of the East. The gospel of Buddha Sakyamuni is simply an apotheosis of Death. His doctrine is a system of moral nihilism, and expounds a plan

for avoiding the disappointments of life by renouncing its hopes. According to that dogma, not sin or sickness only, but life itself is an evil, and death its only remedy—definite death, to be purchased by the systematic suppression of all vital instincts, and the concentration of all hopes upon the prospect of Nirvana, the peace of final extinction. Among the bondage-crushed millions of the furthest East that ghastly creed soon attained a popularity rivaled only by the popularity of opium. Buddhism is a moral narcotic which has completed the abasement and enervation of its votaries and made the imagined worthlessness of life a melancholy fact, but which for millions of abject wretches has undoubtedly also mitigated the bitterness of that fact. To him who has succeeded in deadening the love of life the daily little vexations of existence become as insignificant as the roadside thorns to a man on his way to a self-chosen grave, and the devotee who had renounced all hopes but that of extinction could more easily brook the life-shortening misery of toil and despotism. Despotism itself seems to have recognized the advantages of that tendency, and the shrewd autocrats of China and Siam were zealous promoters of a creed that helped to lethargize the rebellious instincts of their slaves.

Under exactly analogous auspices the Doctrine of Renunciation was afterward preached on the shores of the Mediterranean. The moral energy of the vanquished nations of Syria and Asia Minor had been exhausted by centuries of incessant warfare. Despotism, aided by luxury and vice, had undermined the manhood of their conquerors, and it is a curious fact that the conversion of the Roman Empire was preceded by a widespread epidemic of pessimism. Even during the long peace of the Antonines the philosophers of Greece and Rome vied in lamenting the hopelessness of the prevailing degeneration, and in exalting the solace of exile and suicide. The stoicism of Marcus Aurelius was tinged with a despondency bordering on absolute life-weariness. Moralists and historians plainly predicted the impending fall of the Empire, though that fall seemed to involve the absolute ruin of civilization. The propaganda of a world-renouncing gospel of anti-naturalism intensified and consolidated those tendencies, and soon spread with the rapidity of a moral epidemic. Patriots passionately resisted that consummation of their doom; philosophers appealed to every remaining vestige of manhood and common sense, but the world-renouncers were favored by the general current of tendencies and were soon able to enforce the victory of their creed by compulsory education and the sword of secular power. That triumph, however, would have been consummated even without such allies. The seed of anti-naturalism had fallen on a receptive soil. The anti-physical principle of the new religion strongly recommended itself to

an era of physical degeneration. Effeminate sensualists welcomed the discovery that "physical exercise profiteth but little." The victims of decrepitude consoled themselves with the hope of a better hereafter. Envious impotence denounced the worldliness of physical recreations. Mental emasculation, too, was glad to exchange the pursuits of philosophy for the duties of faith and spiritual subordination. By dint of persistent inoculation the dogmas of pessimism gradually acquired the strength of hereditary instincts; the nations of Southern Europe learned to crave for the moral opiates of their priesthood, as a generation of inebriates learns to crave for the influence of spirituous narcotics; and when the manlier nations of the North shook off the yoke of spiritual bondage, the Latin races continued to hug their fetters—not by the accident of political vicissitudes or hierarchical compulsion, but as an inevitable consequence of deep-rooted race tendencies. Italy would have burnt Martin Luther, as she burnt Bruno and Savonarola; with or without Martin Luther Germany would sooner or later have burnt the papal bull. Like other errors of dualism, the doctrines of other-worldliness were always strongly repugnant to the naturalistic instincts of the German race. They had indured that doctrine as an unwilling patient might indure the taste of a virulent drug, which to others may have become a mind-enslaving tincture, but which to him never ceases to be repulsive to a degree revealed in the opportune moment of emancipation from the thralldom of the drug-monger. And though in breaking their fetters, the Northern Aryans could not break the entrenched strongholds of supernaturalism, their home-creed is fast reverting to the type of a pure monism. In a thousand days the listener at the fireside of a thousand German and Anglo-American homes would not be apt to hear a single allusion to the vagaries of dualism; the fancies of other-worldliness, preternaturalism and spiritism are as downright distasteful to a large plurality of our Germanic contemporaries as the dogmas of St. Boniface were to the countrymen of Wittekind. After a millennium of dogmatic intrigues race tendencies have prevailed against the combined power of secular and spiritual despotism.

#### THE FUNDAMENTAL PROPERTIES OF MATTER.

BY J. G. VOGT.

##### I.

*Translated from the German by F. W. Norton.*

Despite the vast acquisitions of the natural sciences—the blinding flood of light which they have cast upon us—we must not overlook their great imperfections—their shadow side. Observation and the ceaseless collection of astonishing facts keep swelling the storehouse of knowledge. Before it we stand with covetous looks; and in its boundless riches the scientist revels. With weak and uncertain strides the *thinker* makes his way.

Speculation is under ban and bar. In the blind self-assertion of empiricism, this, the most powerful weapon of the human mind, which has led it to its proudest victories, is to-day cast aside in contempt. A systematic treatment of the empirical matter of the universe, a philosophical insight into scientific acquisitions, is a thing which is neither honored nor striven for. Precious as are the revealed treasures, says Haeckel in strict truth, our modern scientific knowledge resembles a promiscuous stone heap which must be sorted and brought to a systematic structure before it can acquire real worth.

Instead of regarding the world as a whole, and uniting observed facts together according to their causes so as to make possible an explanation of the universe, every scientist takes a piece of the world, dissects it and analyzes it. Untroubled by the import of others, this particular part is for him the world, which, in his own way, he seeks to explain. If, however, this world is a systematic whole, and we cannot think of it otherwise, then any phenomenon which is taken from this whole cannot be explained by itself alone. When a scientist deviates from this, the only correct point of view, and seeks to explain things by themselves and not in connection with the universe, all experiments, as, for instance, those touching the phenomena of life or intellectual activities, must end in a pitiable failure. The physicist arranges his atoms and their powers, without troubling himself about biology and physiology; he constructs his mechanism of the world without the slightest reference to the phenomena of life and their tendencies. And so, on the other hand, biology constructs an organic substance, without questioning in respect to it, whether the inorganic phenomena may not be deduced from it.

For matter or world-substance (which includes the two great groups, organic and inorganic phenomena), we have first of all to seek a fundamental conception—one which will contain in itself, unconditionally, the elements for the world's vast series of evolutions, in both realms. With what blindness this greatest of all requirements is neglected, and how all logical thought is retarded and kept working on the surface of phenomena, is shown, for example, by the attempts that have been made to explain, and even to imitate, the origin of the first germs of life. Equally unfortunate have been the attempts, hitherto made, to explain spiritual phenomena; they have always reverted to the idealistic fallacy. I merely recall here the false conclusions of a modern kind of monism, which is at present popular, and which in some respects surpasses idealistic dogmatics in superficiality.

This wrong monism starts from the same fundamental conception as we do. It attributes to matter the two fundamental properties, motion and sensibility

or feeling; and concerns itself with deducing from this principle of sensibility or feeling the organic and spiritual phenomena. But how greatly does this false view of monism err in this! Instead of deducing from these elementary properties the higher phenomena of evolution, it transforms the most complex conditions and processes into elementary substance itself. The organic impulses, the most complicated qualities and modes of feeling, the intellectual forms of intuition respecting space, time and causality, it attributes directly to the principle of feeling as the fundamental property of matter itself. For example, it is not enough for an atom to have simply the property of mechanical motion; it must also possess that of feeling, together with the impulses of life and order, the intuitions of space and time, the idea of causality, and the like! Who does not see that this is not accomplishing a solution of the riddle, but is merely evading a solution? Idealism is only tricked out with another name and another form.

If we examine the conceptions of matter or substance, which have been framed for the world's mechanism, we find the most popular to be the *kinetic*, that lying at the foundation of modern mechanics. From of old, this has offered at least the prospect of explaining organic and even spiritual phenomena. The idea, however, of a hard particle of matter vibrating in empty space, and acting only by its impact, is inconceivable. The deduction of any reasonable and conscious action from such a fundamental principle, from this incorporation of blind chance or willess, purposeless force—how can such a theory recommend itself to thinking minds! Yet the philosophical necessity of our physics compels us, in the face of the manifold operations of the organic world, to pay homage to such a principle. Permit me, then, for the sake of establishing my own position, to adduce something further.

The only conception of matter, which affords us here a free course, is founded, in direct opposition to separate particles vibrating in empty space, on the idea of a *continuous*, contractile, elastic matter (*Weltschubstanz*, the world-substance), which fills the illimitable space without interruption, and whose sole manifestation of power consists in *contraction* or *condensation*. In consequence of this energy of condensation we have to conceive of the world-substance as *differentiated*; i. e. it is composed of infinitely small centers of condensation, which are severed from one another, yet without being separated by empty space from one another. There is thus expressed merely the individualization which meets us in an unmistakable way in all cosmic phenomena and which has received its most complete and correct expression in the former atomistic theories. These centers of condensation exactly represent the atoms or primitive atoms of the old ideas of matter. Imagine, for example, a rubber plate stretched over a table and fastened at the

edges of the table. On this rubber plate let any number of hands be placed, flatwise, at equal distances. If these hands now close *uniformly* the rubber in the palms of the hands shrinks or concentrates. Thus it is clear that in the spaces originally empty, that is where no hands were laid, a state of tension in the rubber mass must take place. This tension will soon reach a maximum; and if from this moment any one of the hands closes still more and thus grasps a greater amount of rubber, this mass will continue to shrink only on condition that a supremacy be gained over one or more other hands, i. e. that the latter relax in a corresponding degree. This comparison is a crude one, it is true, but it affords us approximately the best standpoint for a comprehensive view.

We can ascribe to the centers of condensation a *medium* degree of density which we may call zero; from which, on the one side, they condense to a maximum degree, and from which, on the other, they expand to a corresponding maximum degree, according as they are compressed or dilated. Now, let us call every advancing condensation a positive fluctuation and every retreating expansion a negative fluctuation. Thus we have a maximum value for the positive and a maximum value for the negative fluctuations. According to the fineness of the distinction we wish to draw, we can interpose any number of changes in volume between the two maximum values. In other words, a center of condensation may require millions or billions of condensation vibrations before it passes from the maximum degree of the negative fluctuations to the maximum value of condensation. It must, then, be unquestionably true that the *exclusive tendency* of matter is *condensation*. Every center of condensation strives intensely toward the positive maximum value; and every relaxation, every negative fluctuation, can only be *pushed* or *forced upon* a center of condensation. If it has experienced such a negative fluctuation, it always seeks to free itself from this; and only when the opposition of the surrounding centers of condensation is too great for it to overcome does it retain the negative fluctuation received. Every condensation, every positive fluctuation, suffers a diminution of volume; every negative fluctuation, on the other hand, an increase of volume; and, since we regard matter as continuous, it clearly follows that for every positive fluctuation of a center of condensation a negative fluctuation of one or more other centers must follow. Every approach to a center of condensation influences the affected centers, so as to cause a further condensation.

On this transference of condensation impulses depend the enormous series of physical phenomena, in which is rooted the nature of heat, light, electricity, etc. I have in a larger work, "Force; a Monistic View of the World" (Leipzig, Haupt & Tischler, 1878), explained

how, by the opposition of positive and negative fluctuations, the compression and expansion of centers of condensation, the entire mechanical world-process springs into life and exhausts itself; how whole groups of centers of condensation united and formed the first germs of the spheres; how the masses in the intermediate space were forced to absorb from these condensed planetary bodies their condensation impulses; how thereby the fundamental distinction between ether and matter gradually shaped itself; how by the intensified ethereal masses the phenomena of motion and gravitation were called into being; in short, how by transference of condensation impulses the physical powers of light, heat, electricity, magnetism and chemism can be fully explained.

(To be continued.)

### SOCIAL PROBLEMS.

THE OPEN COURT presented in its latest issues two essays on social problems, "The Ethics of Economics" by Gould, and "National Taxation" by Anti-monopolist. The one proposes as a solution of the social question an "equivalence of service" which should be realized by a system of co-operation; the other suggests in the place of our import duties an income tax which should be assessed under oath. Both articles are interesting reading; they are also keen in their arguments so far as they are negative, showing the weak points in the position of their adversaries. Both call for reform and demonstrate that it is greatly needed. But concerning the means by which they would improve the present state of things, we cannot agree with them. The co-operative system, as suggested by Mr. Gould, has hitherto proved a failure because in this scheme one important factor is omitted. Only *profit-sharing* is taken into consideration; but it is forgotten that this must necessarily imply *loss-sharing* also.

The proposition of Anti-monopolist to introduce a taxation of income is an interference with the personal liberty of the citizens by subjecting their business and their books to the inspection of the tax-gatherers. There can be no doubt that real estate, the immovable property which cannot be hidden and is easily assessed, is the fittest object for taxation. Also luxury can be taxed in consideration of the fact that many people like the display of certain luxuries because they are expensive. An income tax will always be objectionable and if it is based on self-assessment, it will be a premium to the unscrupulous and dishonest.

### THE HEROES OF FREE THOUGHT.

Who are the heroes of free thought? Those who smile at religious sentiment and think that "religion is good for the masses while the educated naturally stand above any religious emotion"—or those who struggle and yearn for truth, who suffer for it and advance

slowly, but earnestly, on the path of human progress? The former may be more advanced in refinement, knowledge and worldly wisdom, but the latter only are the heroes of free thought. Such men were Giordano Bruno, Spinoza, Luther, Lessing, Hume, Kant and others, and it is noteworthy that almost all of them were not only from childhood earnestly pious, but that they also came from families where religion was more than the mere observance of ceremonial rites.

Let us confine ourselves to the best known of such characters. David Hume is a Scotchman, whose ancestors were, as are all the old Scotch people, very devoted Puritans. Kant, also, is of such Puritan Scotch origin, and we know that his mother was a devout Christian.

Spinoza is a Jew. His parents left their home in Spain for Holland, in order to remain faithful to the religion of their ancestors. They might have comfortably remained in Spain if they had abjured their belief and turned Christians. The religious spirit of Spinoza's writings is fully appreciated even by his adversaries, and he showed this religious spirit in practical life when, for the sake of truth, he scorned the terrible curse of the synagogue, in the teachings of which he had been educated.

Luther's faith and love of truth is an historic fact. He was a hero of free thought, which his contemporary, the great Pope Leo X., was not. Pope Leo was a free-thinker of the modern stamp. Luther was a firm believer, Leo was an unbeliever. Luther had faith in God like a child. Pope Leo was unhindered by any credo and at the same time was a protector of art and a promoter of humanitarianism. He did much for the Renaissance in resuscitating Greek letters and Greek culture. He built the glorious Cathedral of Saint Peter's at Rome and to show his Hellenic spirit he placed upon the cross formed by the four great aisles of the largest church on earth a cupola resembling the pagan Pantheon. In his heart Greek paganism triumphed over Christianity.

Compare this great Mæcenæ, the free-thinker, the humanitarian, the erudite man, with the poor, almost illiterate Augustine monk. Would you then have recognized the power of free thought in the latter and the lack of it in the former? What gave to the simple-hearted believer the strength to lead humanity one great step onward, so as to gain for every man the freedom of his conscience—the Christian's liberty, as Luther called it? It was not that he believed less of the dogmatic Christianity, but that his religious faith was stronger. Pope Leo was indifferent to religion; he was a free-thinker, and, upon receiving the Peter's pence, spoke of "the profitable fable of Christ." He appreciated and understood Luther's opposition so little that he thought his preaching against Tetzel's sale of indulgences was

mere jealousy of the Augustine monk's against the Dominican Order, to whom the sale was entrusted. Leo could not imagine that any one would endanger his life for the sake of conviction.

Luther very probably would have been shocked had he foreseen that humanity would advance on the path of religious free thought. He did not see so far. But it was better for him and better for the cause which he boldly defended. We, however, should learn from the juxtaposition of those two men, Leo X. in all his papal splendor and the poor monk Martin in his simple faith, that the heroism of free thought is no mere indifferent negation of religious dogmatism, but strong faith—religious faith—and confidence in truth. Let us boldly and consistently think the truth, let us speak the truth modestly but firmly, that is the spirit by which the heroes of free thought became a power and rose above their time so as to lead humanity to higher and nobler aims. P. C.

#### DEATH AND MAY.\*

BY LOUIS BELROSE, JR.

How calmly beautiful! The moonlight covers  
The vale and woodland with a mystic haze  
And over all a brooding spirit hovers,  
The phantom of itself in other days.

The warmth of spring is on the ground new-broken;  
The birds are in their nests upon the tree;  
The blossom and the bud alwhere give token;  
O Death, cold Death, lift up your eyes and see!

Lift up your eyes—have I not owned your power?—  
And see what thing it is that makes me grieve,  
What wealth of beauty May has brought for dower,  
What wealth of beauty you would have me leave.

See there where young Love walks and youth and  
maiden

Follow without misgiving as he goes;  
The weight wherewith their longing hearts are laden  
But shadow of the coming of the rose.

Look up and see the star that like an ember  
Fades slowly as the rising moon takes height—  
An eye made dim with bliss; O Death, remember  
How once I thought your dark was blinding light.

Anon the levant sky will send a warning  
And all that fear the sun will hide away,  
Another world will wake to greet the morning  
And joys of night give place to joys of day.

Look up and see the glory and the gladness  
That I forewent to make myself your thrall.  
Fear not! no hope can come to rend the sadness  
That clothes around my spirit like a pall.

O Death, no sword of yours alone had harmed me;  
This leaden hand was strong in fence and youth;  
Mine eyes that looked on yours when you disarmed me  
Were dazzled by the sudden glare of Truth.

I yield, but let me dream a single hour,  
O, let me dream of what life was to me,  
And feel as then once more in all its power  
The magic of the Mays that used to be.

Smile on! my heart has learned to brook derision;  
For that the lessons of the world suffice;  
Smile on! It comes again as in a vision,  
That sense of something in the moon-lit skies!

It comes! it fills the distance where the haze is,  
Beyond the valley where the woodlands part;  
I feel it rolling through the forest mazes;  
It comes, it comes! I feel it in my heart!

O joy! Breathe low, the violets are sleeping.  
O joy! Breathe low and let the flowers dream.  
My little friends, the blades of grass, are weeping,  
But all for joy—see how their bright tears gleam!

No sound but that strange swell that seems to number  
The world's heart-beats; no night-bird's call to break  
The silence of the myriads that slumber,  
The silence of the myriads that wake.

The wood, the vale, where was it that I knew them  
As now they are? in what forgotten days?  
Two lovers that I know come walking through them.  
A bit of England out of Shakespeare's plays!

I feel old lands beyond the vague horizon  
Where once the spring made warm our new-land  
blood,

Beyond, beyond, a shore my soul keeps eyes on,  
A distant shore, unwashed of earthly flood.

On such a night we stood where swift and swollen  
The river ran, and watched the moon-lit wave,  
Till passed a cloud, when love's first kiss was stolen;  
By yon pale star was seen the first she gave.

Sweet influence of earth and heaven blending  
Toward fruitful harvest of the seed new-sown!  
A mystic promise of the life unending;  
A matchless vision of the joys unknown.

A dream, a dream! O Death, is joy but dreaming?  
Our lives are fallen upon evil days;  
Time was when all fared on through hopeful seeming,  
But we have reached the parting of the ways.

Our comrades go where yet the roadside flowers  
With all the bloom that makes our old selves yearn,  
We walk in dust and feel no soothing showers;  
Our grief it is to know that they must turn.

No gilded cloud, no fond mirage deceives us,  
We walk in dust along unfruitful lands,  
And all the way one only thought relieves us,  
That toil may thrive. Our hope is in our hands.

Farewell the vision of a joy found hollow;  
Heart's ease of things unending now farewell.  
Fare with us love for all that need must follow;  
Fare with us strength to build where they must dwell.

For us the night, for them shall be the morrow,  
False hope forgot and groundless faith laid by;  
The rising sun will brighten every sorrow  
When stars are all we look for in the sky.

We know they dream, the friends from whom we  
parted,  
We know they dream and know that they must  
wake.

They dream in peace and we are heavy-hearted;  
What can we give for all the dawn must take?

When cold and dim the Truth's first rays fall slanting  
On eyes that open but that leave the heart  
As yet a little while to sleep's enchanting  
We'll light the fires and do the morning's part.

And though we bring but little store of promise,  
One grief that we have known they shall not know;  
The feeling of all fellow-souls far from us,  
The loneliness that doubles every woe.

Man's heart must cling to something. Shall it never  
Have rest in hope that Time cannot destroy?  
O heart, be comforted, for man's endeavor  
Shall find the gradual peace that turns to joy.

## CORRESPONDENCE.

### CHILDREN'S THEOLOGICAL SAYINGS.

To the Editor: WORCESTER, MASS., February, 1888.

Readers of *THE OPEN COURT* will be interested in a droll discussion that has cropped out in a recent number of that excellent mother's magazine, *Babyhood*. This journal has a department entitled, "High-Chair Philosophy," in which the amusing sayings of children on all possible topics, and among others on theology, are chronicled; and an English mother has written to protest against the publication of these latter as sacrilegious. It is wrong, she urges, to laugh at such things. When a child prays, "Give us this day our daily bread, with butter and jam both," she thinks this sweet prattle too sacred for the world to joke and laugh about. To this the editor of *Babyhood* replies that no question can be more important than the process by which children acquire their religious beliefs, and the best way to study this process is by collecting children's sayings on religious topics. "Such a study may enable us to do much toward preventing the mind at its earliest development from wandering into all kinds of fantastic notions." It may be added, also, that the mirth provoked by these sayings seems of the most innocent kind, for it is the mirth of love. Moreover, the questionings of the young have often served a good purpose by opening older eyes to the absurdities of some false belief. "Let the world beware when a thinker is

born," says Emerson, and are not all children thinkers? Their inquisitive minds refuse to accept off-hand the conventional beliefs that satisfy grown-up people, and on the whole the circumstance is to their credit. They believe in looking into things; and the whole history of rationalism lies potentially in the child who asks its mother whether God wears a hat. XENOS CLARK.

### THE TITLE "OPEN COURT" AND ITS PROPRIETY.

MR. HEGELER: NEW YORK CITY, Feb. 27, 1888.

Dear Sir—Why not change name of *THE OPEN COURT* to the one you originally proposed, "The Monist"? You had a definite purpose in establishing the paper—the diffusion of "Monism." You yielded to the proposition to give the paper the name suggested by Mrs. Underwood in order to overcome the objections of the Underwoods—proper enough perhaps from their agnostic standpoint, but without validity from your monistic point of view. Now change the name; make it definite, and also make the purpose and spirit of the paper definite and consistent. What have such articles as Trumbull's, Whipple's, Woolley's, Gould's and Cole's to do with Monism? What have eight out of ten of the articles in the last issue to do with Monism? Give us more of your own thought relating directly to Monism and eliminate irrelevant discussion, such as abounds in Nos. 25 and 26, and thereby show your readers that you have a definite purpose. Invite discussion of your Monistic views. Intelligent readers are tired of the common place of philosophy and theology.

Yours truly,

A MONIST.

[The advice given in the above letter is no doubt well intended, but it is not wise to change the name of a journal after it has once become established, especially when its main purpose is clearly expressed on its title page. "To reconcile religion with science," in order that they may work harmoniously together in the elevation of mankind, is the object of *THE OPEN COURT*. This mission, in the opinion of the founder and the editor of *THE OPEN COURT*, is to be performed by Monism. Monism is not a side-issue, but the fundamental principle of philosophy, a principle whose branches extend over the whole domain of science and ethics and draw nourishment from every truth in the world.

The title of this journal is an invitation or friendly challenge to all opponents to disprove if they can the Monistic argument contained in the editorial columns and in the varied contributions to *THE OPEN COURT*. To this end all intelligent criticism is given welcome, and also such contributions are acceptable as do not agree with the owner's and editor's views, although both reserve their rights to state their differences of opinion when at variance with the contributors. By this method it is hoped that the aim of the journal is best attained and in this sense the name of *THE OPEN COURT* is fully warranted.

If "A Monist" will read again the articles to which he takes exception, he will find that most of them contain a moral related more or less to the religious and ethical principles found in Monism as a conception of practical life which includes within it every duty. The physical sciences and the moral sciences harmonize in Monism and their laws confirm its claims. Physiology is an important part of religion, although it is generally classed among the natural sciences, and the study of it is necessary to a correct understanding of Monism. And so of politics, ethics, law and all the relations of men in church, in state and in private life.

The Nos. 25 and 26, mentioned by our correspondent, are full of monistic thought. The homely philosophy of "Wheelbarrow" is Monism in a laborer's garb. Prof. Gizecki is a professed adherent of Monism. "The Value of Doubt," by Gen. Trumbull, is not a tribute to agnosticism. He does not

deify doubt, he merely recommends it as a means for avoiding error, and obtaining a definite statement of the truth. He might have called "doubt" criticism or self-criticism, but we cannot quibble so closely with our contributors about words. The other articles in those numbers have a Monistic moral, especially the editorials and the story of "The Lost Manuscript." Its pages one by one are full of Monism. I remind the reader of the thoughts expressed on the occasion of the storm, during which the great fir-tree was smitten by lightning. How far many of the essays arrange themselves into the frame of THE OPEN COURT may be learned from our circular which will accompany this number.

We shall be very glad to hear from our correspondent again.]

## BOOK REVIEWS.

BIOGRAPHIES OF WORDS AND THE HOME OF THE ARYAS. By F. Max Müller. London: Longmans, Green & Co. New York: 15 East Sixteenth street; 1888.

The author says in the introduction:

"If what I have tried to prove in my *Science of Thought*\* is true, if thought is impossible without language, as language is without thought, many things will follow, not dreamt of yet in our philosophy. But leaving aside these graver matters for the present, there is one thing which, as everybody can see, will follow by necessity from the admission of the inseparableness of language and thought, and that is that all thoughts which have ever passed through the mind of men must have found their first embodiment, and their permanent embalment, in words.

"If then we want to study the history of the human mind in its earliest phases, where can we hope to find more authentic, more accurate, more complete documents than in the annals of language? \* \* \*

"Our words are not rough, unhewn stones, left at our door by a glacial moraine; they are blocks that have been brought to light by immense labor, that have been carved, shaped, measured and weighed again and again, before they became what we find them to be. Our poets make poems out of words, but every word, if carefully examined, will turn out to be itself a petrified poem, a reward of a deed done or of a thought thought by those to whom we owe the whole of our intellectual inheritance, the capital on which we live, with which we speculate and strive to grow richer and richer from day to day.

"Every word, therefore, has a story to tell us, if only we can break the spell and make it speak out once more." \* \* \*

And Max Müller understands how to make words tell their stories:

"What is, for instance, the meaning of the word Father? Has any more plausible interpretation been offered than that it meant feeder, protector, ruler? Pater, Sk. pitar, consists of a radical element Pa, and a derivative element tar. The root of PA means to feed in pa-bulum, food; it means to protect in Sk. go pa, cow-herd; and it means strong, ruler, king, in Sk. pa-ti, lord, *hro-pa-ti*, lord, potis, strong. Some scholars may doubt about the connection of pa in pati with pa in pater, but the fact that father was intended by the early Aryas as a feeder, protector, and lord, would not be in the least affected by this. Which of these three meanings was present to the mind of the original framers of the word it is impossible to say. A root lives in its derivatives, and its meanings are called out and differentiated by the varying purposes which it is made to serve. But whether the Aryas, before they were broken up into Hindus, Persians, Greeks, Italians, Teutons, Slaves, and Celts, conceived the father as a feeder, or a protector, or a ruler, it is quite clear that they could not have framed such a name during the so-called metrocratic

stage, when, as we are told, the mother was the feeder, protector and ruler of her young, and the father no more than a casual visitor. \* \* \*

"When we find such a name as *pasu* in India, Italy, and Germany, used in the sense of cattle, we know that the people who used such a word must have tethered their cattle, for *pasu* comes from a root PAS, to fetter. \* \* \*

"The name for king, *ganaka* in Sanskrit and *chuning* in German, seems to me still, as it did years ago, a very strong argument in support of the patriarchal theory of government. For it could only be among people where the father (*ganaka*) wielded the highest authority that the name for father could become the name for king, as *gani*, wife, became the name for queen, Gothic *quino*. \* \* \*

"Wherever we analyze language in a truly scholarlike spirit, whether in Iceland or Tierra del Fuego, we shall find in it the key to some of the deepest secrets of the human mind, and the solution of problems in philosophy and religion which nothing else can supply. Each language, whether Sanskrit or Zulu, is like a palimpsest, which, if carefully handled, will disclose the original text beneath the superficial writing, and though that original text may be more difficult to recover in illiterate languages, yet it is there nevertheless. Every language, if properly summoned, will reveal to us the mind of the artist, who framed it, from its earliest awakening to its latest dreams. Every one will teach us the same lesson, the lesson on which the whole Science of Thought is based, that there is no language without reason, as there is no reason without language."

The book contains the biographies of many words which are extremely interesting and it reveals the earliest civilization of our Aryan ancestors as can be reconstructed from their language.

The appendices are no less valuable. They contain Max Müller's correspondence concerning Aryan Fauna and Flora, the original home of the Jade, the original home of the Soma, and other topics.

JOURNAL D'UN PHILOSOPHE. PAR LUCIEN ARRÉAT. Paris: Felix Arcau; 1887.

Lucien Arréat is one of those Frenchmen who have affiliated themselves with the modern school of psychology as expounded by Ribot, Binet and others. This he says of himself: "*J'ai mordu à la psychologie nouvelle*" (I have partaken (bitten into) of the modern psychology).

In the introductory chapters of his book, *Journal d'un Philosophe*, p. 4, seq., he says:

I do not dare to attempt to repeat what passed in my little brain. But few of the events remain in my thoughts. Am I really the same one who played at *cligne-Musette* and in whose blond beard the silver threads now mingle? In those happy days of childhood I see myself double, triple and multiple, and that is still myself in whom the devil used to be.

The devil is still there. The child was an imp and the man is no angel either. See me here writing a history of the time when I did not know my letters; a wise history which would surprise the rough boys, who afterward jumped upon my back at leap-frog, and for awhile my little self would rebel in pride; but my big self takes no notice of it, as of the whim of a spoiled child. Are there more wonderful adventures or more astonishing fairy tales? The sensations which come to our consciousness, the network of nerves constituting memory, a special activity which connects the events of the soul, and the personality which issues therefrom! Let more clever ones than I explain it if they can.

Every one of us is like a worker of tapestries, seated at his trade behind the flexible screen, passing the needles filled with wool through the extended canvass. We step before it to judge of our work, but the visitor, anxious to see the proceeding, passes

\* *The Science of Thought*, by F. Max Müller. Longmans, 1887.

behind it and comes to the bench of the worker. Thus the rich patterns of our thoughts have a side which we scarcely know. It is true that we ourselves have done the work; but unfortunately we do not know any the better for it how our hand wove the threads into cloth, nor how it guided the needle, and if we do turn a completed tapestry we cannot at first see anything but knots and ends hanging from it. We would have to see it in progress and to inquire into the thread of the warp as well as into the color of the wool."

In one of our next numbers we shall publish an essay from the above-mentioned volume.

### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

#### CHAPTER VIII.—*Concluded.*

All gazed in horror at the object on the ground.

"This is a serious answer to your question," exclaimed the proprietor. "We pay a dear price for the sport."

He took the light and himself searched the opening; a heap of bones lay there. The others stood around in uncomfortable silence. At last the proprietor threw a skull out into the cellar, and cried out cheerfully, as a man who is relieved from painful feeling:

"They are the bones of a dog!"

"It was a small dog," assented the stonemason, striking the bone with his iron. The rotten bone broke in pieces.

"A dog!" cried the Doctor, delighted, forgetting for a moment his blighted hope. "That is instructive. The foundation wall of this house must be very old."

"I am rejoiced that you are contented with this discovery," replied the proprietor, ironically.

But the Doctor would not be disconcerted, and related how, in the early middle ages, there had been a superstitious custom of enclosing something living in the foundation wall of solid buildings. The custom descended from the ancient heathen times. The cases are rare where such things are found in old buildings, and the skeleton of a beast is an indisputable confirmation.

"If it confirms your views," said the proprietor, "it confirms mine also. Hasten, men, to replace the stone."

Now the stonemason lighted up and felt again in the opening and declared that there was nothing more there. The workman restored the stone to its place, the wine was replaced and the matter settled. The Doctor bore the jeering remarks, of which the proprietor was not sparing, with great tranquillity, and said to him:

"What we have discovered is certainly not much; but we know now with certainty that the manuscript does not lie in this part of your house, but in another. I take with me a careful record of all the hollow places in your house, and we do not give up our claims in regard to this discovery; but we consider you from

this time as a man who has borrowed the manuscript for his own private use for an indefinite time, and I assure you that our wishes and desires will incessantly hover about this house."

"Pray allow the persons who dwell there to participate in your good wishes," replied the proprietor, smiling, and do not forget that in your researches after the manuscript you have in reality found the dog. For the rest, I hope that this discovery will free my house from the ill-repute of containing treasures, and for the sake of this gain I will be quite content with the useless work."

"That is the greatest error of your life," replied the Doctor, with grave consideration; "just the reverse will take place. All people who have an inclination for hidden treasure will take the discovery in this light, that you are deficient in faith and have not employed the necessary solemnities, therefore the treasure is removed from your eyes and the dog placed there as a punishment. I know better than you what your neighbors will record for posterity. Tarry in peace for your awakening, Tacitus. Your most steadfast friend departs, and he whom I leave behind begins to make undue concessions to this household."

He looked earnestly at the Professor and called Hans to accompany him on a visit to the village, in order to take a grateful leave of his old crones, and to obtain one of the beautiful songs of the people, of which he had discovered traces, to take home with him.

He was gone a long time; for after the song there came to light unexpectedly a wonderful story of a certain Herr Dietrich and his horse, which breathed fire.

When, toward evening, the Professor was looking out for him, he met Ilse who, with her straw hat in her hand, was prepared for a walk.

"If it is agreeable to you," she said, "we will go to meet your friend."

They walked along a meadow between stubble-fields, in which here and there grass was to be seen peeping up amongst the stubble.

"The autumn approaches," remarked the Professor; "that is the first sign."

"Winter-time is tedious to some people," answered Ilse, "but it puts us, like Till Eulenspiegel, in good spirits, for we enjoy its repose, and think of the approaching spring; and when the stormy winds rage round us, and the snow drifts to a man's height in the valleys, we sit at home in warmth and comfort."

"With us in the city the winter passes away almost unheeded. The short days and the white roofs alone remind us of it, for our work goes on independently of changing seasons. Yet the fall of the leaf has from my childhood been depressing to me, and in the spring I always desire to throw aside my books and ramble through the country like a traveling journeyman."

\* Copyright.

They were standing by a bundle of sheaves. Ilse arranged some of them as a seat, and looked over the fields to the distant hills.

"How differently you and I regard everything," she began after a pause. "We are like the birds which year after year joyously flap their wings and live here contentedly; but you think and care about other times and other men that existed long before us; you are as familiar with the past as we are with the rising of the sun and the forms of the stars, and if the end of summer is sorrowful to you, it is equally as sorrowful to me to hear and pore of past times; and books of history make me very sad. There is so much unhappiness on earth, and it is always the good that come to a sorrowful end. I then become presumptuous, and ask why has God thus ordered it? It is really very foolish to feel thus, but for that reason I do not like to read history."

"I understand this tone of mind," answered the Professor, "where men strive against their times to establish their own wills, they will almost always in the end succumb as the weaker; even what seems to be successfully established by the strongest minds has no lasting duration. Like men and their works, nations also pass away; but we should not let our hearts cling to the fate of individual men or nations, we should endeavor to understand why they became great and passed away, and what lasting benefit the human race has gained by their life. Then will the narrative of their fate be only a veil, behind which we discover the working of other living powers. We find that in the men who break down, and in the nations that pass away, there is a higher secret life, which according to internal laws is continually creating and destroying. To discover some of the laws of this higher life, and to feel the blessing which this creating and destroying has brought to our existence, is the task and the pride of the historical inquirer. From this point of view, destruction and dissolution are changed into new life, and increasing certainty and elevation of heart comes to those who are accustomed to consider the past."

Ilse shook her head and cast down her eyes.

"And the Roman whose lost book brought you to us, and of which you have been talking to-day, is interesting to you because he has looked upon the world as cheerfully as you have?"

"No," answered the Professor, "it is just the reverse which impresses one in his work. His earnest spirit could never rise to joyful confidence. The fate of his nation and the future of mankind lay heavy on his soul as a secret riddle; he perceived in the past a better time, freer governments, stronger characters and purer morals; he perceived a decline in his people and in the state, which even good governors could no longer retard. It is strange how the thoughtful man doubts whether this fearful fate of millions is the punishment

of the Deity, or the result of there being no God who cares for the lot of mortals." Forebodingly and ironically he contemplates the history of individuals, and his wisest course is to bear the inevitable silently and patiently. When, even for a moment, a brief smile curls his lips, one perceives that he is looking into a hopeless desert; one can imagine fear visible in his eyes, and the rigid expression which remains on one who has been shaken to the innermost core by deadly horrors."

"That is sad," exclaimed Ilse.

"Yes, it is fearful, and it is difficult to understand how any one could bear such a hopeless life. The pleasure of belonging to a nation of growing vigor was not then the lot of either heathen or Christian, for the highest and most indestructible happiness of man is to have confidence in that which exists, and to look with hope to the future,—and such is our life now. Much that is weak, corrupt and perishable surrounds us; but with it all there grows up an endless abundance of youthful vigor. The root and the trunk of our popular life are sound. Everywhere we find domestic life in families respect for morals and law, hard but valuable labor and energetic activity. In many thousands the consciousness exists that they increase the national strength, and in millions that are still far behind them the feeling that they also are striving to contribute to our civilization. This is our pleasure and glory in modern times, and helps to make us valiant and proud. But we well know that the joyful feeling of this possession may also be saddened, for temporary disturbances come to every nation in the course of its development. But its power of thriving cannot be thwarted, nor its career hindered, so long as the power and soundness of these securities exist. It is this that gives happiness to one whose vocation it is to investigate the past, for he looks down from the salubrious air of the heights into the darkness beneath him."

Ilse gazed on him with wonder and admiration, but he bent over the sheaves which were between them and continued with enthusiasm:

"Everyone forms the judgment and mood with which he contemplates the great relations of the world according to the course of his own personal experiences. Here you look around on the laughing summer landscape, there on the busy men in the distance, and on what lies nearer your heart, your own home, and the circle in which you have grown up. How mild is the light, how warm the hearts, how sensible, good and true the hearts of those that surround you! You may believe how valuable it is to me to see this, and enjoy it by your side, and if henceforth, when occupied with my books, I deeply feel how noble and worthy is the life of my countrymen around me, I shall ever have to thank you for it."

He stretched out his hand across the sheaves; Ilse

seized it and clasped it between hers, while her warm tears fell upon it. She looked at him with her moistened eyes, while a world of happiness lay in her countenance. Gradually a bright glow suffused her cheeks, she rose, and a look full of devoted tenderness fell upon him; then she walked hastily away from him along the meadow.

The Professor remained leaning against the sheaves. The meadow-larks on the tips of the ears of grain over his head warbled joyfully. He pressed his cheek against the stack which half concealed him; thus, in happy forgetfulness, he watched the maiden, who was descending toward the distant laborers.

When he raised his eyes his friend was standing by him; he beheld a countenance which quivered with inward sympathy, and heard the gentle question:

"What will come of it?"

"Husband and wife," said the Professor, decidedly; he pressed his friend's hand, and strode across the fields to the songs of the larks which greeted him from every sheaf.

Fritz was alone; the word had been spoken; a new and awful fate overshadowed the life of his friend. So this is to be the end of it? Thusnelda, instead of Tacitus—ah, Fritz felt that the social custom of marriage might be a very venerable institution; it was inevitable for almost all men to pass through the uprooting struggle which is the consequence of a change in the mutual relations of life. He could not think of his friend amid his books, with his colleagues, and this woman. He felt painfully that his relation to the Professor must be changed by it. But he did not think long of himself, but anxiously worried about his rash friend; and not less about her who had so dangerously impressed the soul of the other. The faithful friend looked angrily upon the surrounding stubble and straw, and he clenched his fists against the deceased Bachhuber; against the valley of Rossau; nay, even against it, the immediate cause of the mischievous confusion—against the manuscript of Tacitus.

#### CHAPTER IX.

ILSE.

Ilse had lived an unvaried home life since the death of her mother. Though scarcely grown up, she had taken charge of the household; spring and autumn came and went; one year rolled over her head like another; her father and sisters, the estate, the laborers, and the poor of the valley—these formed her life. More than once a suitor, a sturdy, worthy proprietor of the neighborhood, had asked her in marriage of her father; but she felt contented with her home, and she knew that it would be agreeable to her father for her to remain with him. In the evening, when the active man rested on the sofa, and the children

were sent to bed, she sat silently by him with her embroidery, or talked over the small occurrences of the day—the illness of a laborer, the damage done by a hail storm or the name of the new milch cow. It was a lonely country; much of it was woodland; most of the estates were small; there were no rich neighbors; and the father, who had worked his way by his energy, until he became an opulent man, had no inclination for society life, nor had his daughter. On Sunday the pastor came to dinner, and then the father's farm inspectors remained and related the little gossip of the neighborhood over their coffee; the children, who, during the week, were under the charge of a tutor, amused themselves in the garden and fields. When Ilse had a leisure hour she seated herself in her own little sitting-room with a book out of her father's small library—a novel by Walter Scott, a tale by Hauff or a volume of Schiller.

But now a world of thoughts, images and feelings had been awakened in her mind by this stranger. Much that she had hitherto looked upon with indifference in the outer world now became interesting to her. Like fire-works which unexpectedly shoot up, illuminating particular spots in the landscape with their colored light, his conversation threw a fascinating light, now here and now there, on outside life. When he spoke—and his words, copious and choice, flowed from his innermost heart—she bent her head as in a dream, then fixed her eyes on his face. She felt a respect commingled with fear for a human mind that soared so loftily and firmly above the earth. He spoke of the past as intimately as of the present; he knew how to explain the secret thoughts of men who had lived a thousand years before. Ah! she felt the glory and greatness of human learning as the merit and greatness of the man who sat opposite to her; the intellectual labor of many centuries appeared to her like a supernatural being which proclaimed from a human mouth things unheard of in her home.

But it was not learning alone. When she looked up at him, she saw beaming eyes, a kindly expression about the eloquent lips; and she felt herself irresistibly attracted by the warmth of the man's nature. Then she sat opposite to him as a quiet listener; but when she entered her room, she knelt down and covered her face with her hands. In this solitude she saw him before her and offered him homage.

Thus she awoke to a new life. It was a state of pure enthusiasm, of unselfish rapture, such as a man knows not and only a woman can experience,—which comes only to a pure, innocent heart when the greatest crisis of earthly existence comes to the sensitive soul in the bloom of life.

She saw also that her father was partially under the same magical influence. At dinner, which used to be so silent, conversation now flowed as from a living spring; in the evening, when formerly he used to sit wearily

over the newspaper, much was discussed, and there were frequent disputes which lasted late into the night; but her father, when he took his bedroom candle from the table, was always in cheerful humor; and more than once he repeated to himself, pacing up and down, sentences that had been uttered by his guest. "He is, in his way, a fine man," he said; "in all things stable and sound; one always knows how to take him."

Occasionally she was alarmed at the Professor's opinions. The friends, indeed, avoided what might wound the deep faith of the hearer, but in the conversation of the Professor there sometimes seemed to be a peculiar conception of venerated doctrines and of human duties; and yet, what he maintained was so noble and good that she could not guard herself against it by her own reasoning.

He was often vehement in his expressions; when he condemned he did it in strong language, and sometimes became so vehement that the Doctor and even her father withdrew from the contest. She thought then that he was different from almost all men—prouder, nobler and more decided. When he expected much of others, as is natural to one who had lived in closer intercourse with the ideal world than with real life, it alarmed her to think in what light she must appear to him. But, on the other hand, this same man was ready to acknowledge everything that was good, and he rejoiced like a child when he learnt that anyone had shown himself brave and energetic.

He was a serious man, and yet he had become a favorite with the children, even more than the Doctor. They confided their little secrets to him, he visited them in their nursery, and gave them advice according to his youthful recollections, as to how they should make a large paper kite; he himself painted the eyes and the moustache, and cut the tassels for the tail. It was a joyful day when the kite rose from the stubble-field for the first time. Then, when evening came, he sat down, surrounded by the children, like the partridge amongst her young. Franz climbed up the arm-chair and played with his hair; one of the bigger ones sat on each knee; then riddles were given and stories told; and when Ilse heard how he repeated and taught small rhymes to the children, her heart swelled with joy that such a mind should hold such intimate intercourse with simple children; and she watched his countenance and perceived a child-like expression light up the features of the man, laughing and happy; and she imagined him as a little boy, sitting on his mother's lap. Happy mother!

Then came the hour among the sheaves, the learned discourse which began with Tacitus and ended with a silent acknowledgment of love. The blessed cheerfulness of his countenance, the trembling sound of his voice, had torn away the veil that concealed her own

agitated feelings. She now knew that she loved him deeply and eternally, and she had a conviction that he felt just as she did. He, who was so greatly her superior, had condescended to her; she had felt his warm breath and the quick pressure of his hand. As she passed through the field, a glow suffused her cheeks; the earth and heaven, fields and sun-lit wood, floated before her like luminous clouds. With winged feet she hastened down into the woody plain, where she was enveloped in the foliage. Now she felt herself alone, and unconsciously seized a slender birch stem, which shook with her convulsive grasp, and its leaves were strewn all around her. She raised her hands to the golden light of the heavens and threw herself down on the mossy ground. Her bosom heaved and panted violently and she trembled with inward excitement. Love had descended from heaven upon the young woman, taking possession of her body and soul with its irresistible power.

Thus she lay a long time. Butterflies played about her hair; a little lizard crept over her hand; the white tips of the wild flowers and the branches of the hazel bent over her, as if these little children of nature wished to veil the deep emotions of the sister who had come to them in the happiest moment of her life.

At last she rose upon her knees, clasped her hands together and thanked and prayed to the dear God for him.

She became more collected and went into the open valley, no longer the quiet maiden she was formerly; her own life and what surrounded her shone in new colors, and she viewed the world with new feelings. She understood the language of the pair of swallows which circled round her, and with twittering tones passed by her swift as arrows. It was the rapturous joy of life which impelled the little bodies so swiftly through the air, and the birds greeted her with a sisterly song of jubilee. She answered the greeting of the laborers who were going home from the fields, and she looked at one of the women who had been binding the sheaves, and knew exactly what was the state of her feelings. This woman also had, as a maiden, loved a strange lad; it had been a long and unhappy attachment, attended by much sorrow; but now she was comforted going with him to her home, and when she spoke to her mistress she looked proudly on her companion, and Ilse felt how happy was the poor weary woman. When Ilse entered the farmyard, and heard the voices of the maids who had waited for her in vain, and the impatient lowing of the cattle, which sounded like a reproach on the loitering mistress, she shook her head gently, as if the admonition was no longer for her, but for another.

When she again passed from the farm buildings into the golden evening light, with fleet steps and elevated head, she perceived with astonishment her father standing by his horse ready to mount, and with him, in quiet

conversation, the Doctor, and he whom at this moment she felt a difficulty in encountering. She approached hesitatingly.

"Where have you been lingering Ilse?" cried the proprietor. "I must be off," and looking at the agitated countenance of his daughter, he added: "It is nothing of importance. A letter from the invalid forster calls me to his house; one of the Court people is come, and I can guess what they desire of me. I hope to be back at night."

He nodded to the Doctor. "We shall see each other again before your departure."

So saying, he trotted away, and Ilse was thankful in her heart for the incident which made it easier for her to speak with composure to the friends. She walked with them on the road along which her father had ridden, and endeavored to conceal her disquiet by talking on indifferent subjects. She spoke of the hunting castle in the wood, and of the solitude in which the gray-headed forster dwelt among the beech-trees of the forest. But the conversation did not flow; each of those noble hearts was powerfully touched. The Professor and Ilse avoided looking at each other, and the friend could not succeed, by jocose talk, in drawing the lovers down to the small things of life.

Ilse suddenly pointed with her hand to a narrow pass on one side, from which many dark heads were emerging.

"See! there are the Indians of Frau Rollmaus."

A number of wild figures came on with a quick step, one behind the other; in front a powerful man in a brown smock-frock and shabby hat, a stout stick in his hand; behind him some young men, then women with little children on their backs; all round and about the troop ran half-naked boys and girls. Most of the strangers were bare-headed, and without shoes. Their long black hair hung about their brown faces and their wild eyes, even from a distance, stared eagerly on the walking party.

"When the autumn comes, these people sometimes wander through our country; they are jugglers who are going to a fair; but for some years they have not ventured into the neighborhood of our estate."

The troop approached; there was a wild rush from the gang, and in a moment the friends were surrounded by ten or twelve dusky figures, who pressed on them with passionate gestures, loud cries and outstretched hands—men, women and children, in tumultuous confusion. The friends looked with astonishment on their piercing eyes and vehement movements, and on the children, who stamped with their feet, and clawed the strangers with their hands like mad creatures.

"Back, you wild creatures," cried Ilse, pushing herself through the band, and placing herself before the friends. "Back with you; who is the chief of the band?" she repeated with anger, and raised her arm commandingly.

(To be continued.)

# The Open Court

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE OPEN COURT is devoted to the work of conciliating Religion with Science. The founder and editor have found this conciliation in Monism—to present and defend which is the main object of THE OPEN COURT.

THE OPEN COURT has for contributors the leading thinkers of the old and new world.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social and economic questions.

TERMS, \$3.00 PER YEAR. SINGLE COPIES, 10 CTS.

## KARL THEODOR BAYRHOFER AND HIS SYSTEM OF "NATURALISTIC MONISM."

BY EDMUND MONTGOMERY.

A few weeks ago, February 6th, there died, on his Wisconsin farm at the age of seventy-six, a man who was a leader of men in thought, word and deed. In his native country, in one of the most stormy phases of old-world struggle for religious and political liberty, he fearlessly led the van till the last glimpse of hope had vanished and the liberal cause lay prostrate at the mercy of the armies and minions of despotism. In the realm of thought as scholar and teacher he worked his upward way from the densest fogs of religious superstition, through the all too rarified atmosphere of Hegelian Intellectualism, to a profound and serene view of nature, in which material and mental phenomena are monistically and naturalistically conceived as adequate manifestations of absolute and eternal All-Being.

Karl Theodor Bayrhofer was in every respect a genuine representative of the idealistic striving, known as German "Storm and Stress." He was, all in all, an intensely animated embodiment of German Philosophy and German Humanism. At home his philosophic and humanistic hopes had all been wrecked for the time being. But when in 1852 he found safety from prosecution by landing on the hospitable soil of this free country, he very likely expected philosophical Republicanism to be here already in full swing. He, no doubt, met with much sympathetic consideration so far as his political views and aims were concerned. But where were those who would patiently listen to his philosophical persuasions and demonstrations? Yet his thought was to him the veritable life of his being. To him life, not consistently guided by philosophical reason, was no human life at all, but mere animal existence.

With such exalted views, despite all his fervid trust in an eventual rational reorganization of political and social life, it must have been a weary waiting and watching for him these many years to discern actual symptoms of his expected era of philosophical enlightenment and its unselfish humanistic rule. Still, in truth, much has lately been accomplished here in this direction also; if not politically and socially, then at least regarding the philosophical contemplation of the import of human existence. And these philosophical endeavors have followed mostly German lines of thought.

Even twenty years ago, who in this country and in England would have thought that "German Philosophy," then almost universally ridiculed as the vaguest of vagaries, would come to be taught as highest wisdom at our principal seats of learning—that our Christian professors of philosophy, driven to extremity by the relentless inroads of natural science, would find no better shield against "infidelity" than the airy fabric of self-sustained concepts conjured into fictitious existence by the juggling dialectics of Hegel? Yet so it is. Hegelianism has once more become a mighty staying power among thinkers in the Christian camp.

Germans, about the middle of the century, had themselves very generally turned away with disgust from the grandiloquent *a priori* speculations of their renowned philosophers. These wordy constructions had proved prolific of nothing but fantastic dreams which had deranged the head of many a promising youth. And, moreover, by force of their visionary character, they had been the chief cause of the non-success of the liberal political aspirations which had seemed so near fulfillment in the revolutionary movement of 1848. In those stormy days of revolt against misrule and oppression, the German parliament was filled with Hegelians—Hegelians of the right wing and Hegelians of the left wing, arguing with one another whether the constitution should or should not be theocratic, until the golden opportunity for action was lost.

During the following reactionary period natural science engrossed more and more thoroughly the attention of the thoughtful. Eminently successful through close adherence to the experimental method, its votaries lost completely sight of the "Philosophy of Nature," propounded a few years before by Schelling and Oken to an enthusiastic audience largely composed of students of medicine and natural science. Sober investigators of the sensible facts of nature, as this new generation of naturalists professed itself to be, it could discern nothing within the sphere of veritable existence but units of mass grouped and actuated by physical forces; or, better still, grouped and actuated merely by the transmission and dissipation of definite quantities of motion or energy.

But the satisfaction afforded by this ready mode of accounting for things was not destined to last. Nature did not altogether admit of being thus algebraically emptied of her indwelling wealth. She soon thrust her

old psycho-physical riddle in the way of her mechanical explorers. It was the physiology of the senses worked at with all the precision of a physical science which, even to the most mechanically inclined, unavoidably disclosed the essential dissimilitude obtaining between the nature of the physical stimuli affecting the senses and that of their stimulated mental or conscious effect. Undulations of air or ether were now scientifically recognized to be physical occurrences incommensurably unlike the sensations of sound or color experienced in consequence of their striking our ear or eye. And a little further consideration discloses the strange and perplexing fact that the air-waves and ether-undulations, so clearly apprehended as physical occurrences, are themselves, nevertheless, only mental representations in terms of purely individual sight-perception, of the hidden powers that awaken such determinate perceptions in us.

Thus, natural science, prying according to its own method into the secrets of organic life, found itself once more brought face to face with the great standing enigma of philosophy: how in reality is the microcosm, we find figured in our own individual perception, related to the macrocosm, subsisting independently of this mental realization of ours?

Scientists, despite their zeal to explain everything in keeping with mechanical principles, feel now compelled to acknowledge the existence and importance of the problem of cognition, which they had managed steadfastly to ignore for awhile. Consequently they have, in search of deeper truth, very generally joined the rush "back to Kant." And it is chiefly through this scientifically accredited indispensableness of a theory of cognition, that Kant has again become the polar-star, by which most philosophical ventures of the present time are guiding their course.

Sixty years ago, in the very heyday of German philosophical speculation, this same sober and close-reasoning Kant became also the guiding-star of a sixteen year old youth, the son of a printer in Kurhessen, who, one memorable day, happened to get hold of a copy of the "Critique of Pure Reason" in his father's little bookstore. This event determined his further course in life. From now on Karl Bayrhafer was determined to devote himself to philosophical research. In 1834 he took the degree of Doctor of Philosophy at the University of Marburg; qualified himself soon after for teaching there as "Privatdocent," and was in due course appointed Professor of Philosophy in the same university.

At that time Hegelianism was paramount in the philosophical world of Germany. The master himself had recently passed away. But ardent disciples were everywhere propagating his system. Unfortunately the state in various parts of the country had placed a serious obstacle in the way of a harmonious and consistent exposition of Panlogism, of which the necessary outcome

is evidently a pantheistic creed of some sort. Zealous ministers of public instruction were, namely, exacting from university professors adherence to Christian Doctrines. The puzzle then arose, how to reconcile free philosophical thought with a prescribed form of State-Religion. Hegel himself, consummately versed in conceptual world evolution, had found no difficulty whatever in making specifically religious dogmas, such as that of the "Trinity," emerge from his self-evolving machinery. And most of his disciples felt no compunction to follow or to outdo the master in subserviency to state-ordinances. But, amongst them, there were some, at least, who had the courage openly to draw the most daring conclusions involved in their philosophical premises. No wonder then, that, in consequence of such irreconcilable tendencies, the Hegelian host divided into "a right and a left wing;" for so this disruptive movement into two hostile camps was mildly designated. The right wing endeavored to press Hegelianism more or less thoroughly into the service of Christianity. The left wing broke altogether loose from Christianity, denying the personality of the creative power and the possibility of individual immortality; and freeing itself, at last, completely, by force of naturalistic considerations, from the belief that the world is made up of nothing but thought or reason.

The most widely known representatives of this intrepid band of revolutionary philosophers are Feuerbach, Strauss and Bauer. But Bayrhafer, who with them joined the left wing—though little known at present—is by far the most penetrative and consistent abstract thinker of this remarkable free-thought school, whose rallying cry was "Nature and Humanity," and whose mighty liberating influence has spread over all civilized lands.

The burden of this great free-thought movement was eighteenth century liberalism, deepened by the literature and science of the German "Aufklaerung," and above all by the Kantian philosophy. Bayrhafer himself says: "Our philosophy, together with its historical criticism of creeds and their records, must inevitably bring about the overthrow of the realm of religious phantasms, the dissolution of the old dualistic conceptions of matter and mind, and end in the triumph of the all-harmonizing, monistic world-conception."

No one will deny that this bold prediction, uttered with full confidence by our monistic philosopher, is now gaining very much the appearance of a truth in course of fulfillment. Have not Feuerbach's "Essence of Christianity," Strauss's "Life of Jesus," Bauer's biblical criticisms, together with the various attempts of the left-wing dissenters to establish a unitary and naturalistic foundation of being for both matter and mind, worked already a long way towards its realization? And though biblical criticism has been perhaps more imme-

diately effective than naturalistic monism in freeing the popular mind from its grossest superstitions; yet it has long been clear to the initiated that the decisive battle must range round the relation philosophically conceived to subsist between Mind, Matter and Universal Being. It will be well-spent time, then, to listen attentively to a trained thinker, whose life-work has been the elucidation of this dark problem.

Rightly to appreciate how deeply rooted the opinions of our old-world revolutionist, philosopher and humanitarian really are, we have to alight for a moment amidst the influences that have helped to shape them. For radically realistic as his thought may seem in itself, it grew nevertheless out of Schellings and Hegel's idealistic Identity-Philosophy, then in the ascendant in German universities. Himself a professor of philosophy, he stood all-awake in the great intellectual stir, whose echo in England and America had power to fill such men as Carlyle and Emerson with the life-long desire to ingraft its transcendental bent on the culture of their native soil. No wonder, then, that the world-conception, enunciated after many years of struggle for existence from his remote Wisconsin farm, will be found intimately related to the sundry speculative currents that swept the philosophical atmosphere of those palmy days of constructive thought.

Kant had seemingly proved that it is solely the combining activity of our intellect, which from incoherent and shapeless data of sense is building up the orderly world we actually know; and that of the veritable nature of things outside our own perception and thought we can know nothing. Still Kant's final and emphatic verdict was, that our combining and constructing intellect can work only on definite material *given* to our sensibility from outside.

But, the entire world we perceive and know being thus—according to Kant himself—constructed exclusively by our own intellectual activity, why should not this all-containing and all-sufficient product of thought be itself veritable and sole Being? Those surmised outside data of sense, spaceless, timeless, uncombined and unperceived, what can they be but an unimaginable dust of non-entities. And the world of things-in-themselves, invented to account for such fancied notes of pure sense-affection, must be likewise an idle fiction. There is, and need be, nothing in existence save intellectual activity, constituting our Ego and the entire content of its consciousness. Intellectual activity is therefore itself the creative power, identical with its creation, and hence sole and veritable Being.

Such, indeed, was the main conclusion arrived at by Fichte, through consistent development of Kant's assumption of a free intelligible Ego and its nature—constituting thought. And this outright assertion of the thorough identity of Thought and Being—a doctrine

established solely by means of ratiocinative introspection, working exclusively upon the ideal content of consciousness—became the leading principle of the so-called Identity-Philosophy, further elaborated by Schelling and Hegel.

Bayrhammer adhered to the last to Schelling's version of it; at least to his fundamental conception of Transcendental Realism, or "Real-Idealism," as it is generally called. Schelling, namely, amplified Fichte's view by maintaining that, in order that the self-thinking Ego may at all come to know, there must exist something to be known. Consequently, he postulated as ground of all existence, not an absolute Subject merely, but an absolute Subject-Object. The All, which Spinoza had contemplated as absolute Substance, he conceived as absolute World-Ego, in whose activity subject and object, spirit and nature, the ideal and the real are at every stage of manifestation identically interblended, in a similar way as we find them in our own individual perception and conception.

Bayrhammer's naturalistic and hylozoistic Monism is—as will be seen further on—grounded on this conception of the substantial identity of the ideal and the real in every phase of sense-apparent existence and evolution, by which the eternal activity of All-Being becomes manifest to us. The subjective and the objective, inner and outer existence, thought and being, mind and nature, are to him in essence identical. And for this never-shaken view of his he will presently give us very cogent reasons.

From Hegel's Panlogism, which has become so seductive again to university-men of the present generation, and to which Bayrhammer in his early career had completely given himself up, he freed himself chiefly by the aid of Herbart's incisive criticism of the concept of pure Being, which emptied hull of reality, is made by Hegel to serve as foundation of his entire world-comprising air-castle.\* To those whose thinking does not happen to be caught and held in the magic circle of philosophical consistency, it will seem more than puerile to find it seriously enunciated as a newly-discovered truth, that Being does not consist of pure intellectual activity; that sensible things—mountains, for instance—remain still in existence even when not perceived or thought of. Yet it is a fact that the insistence, on the part of Herbart, on this truth—so self-evident to common sense—had power to bring many a Hegelian back to his senses; *i. e.*, back from the bottomless abyss of abstract thought to the actual world of sensible experience.

Of all philosophers of the post-Kantian period, Herbart exerted the most wholesome sobering influence on

\* From 1835 to 1849, in his Hegelian period, and during his transition from Identity-Philosophy Pantheism to Naturalistic Monism, Bayrhammer published a number of works whose titles, dates and place of publication will be found cited in "Meyer's Konversations-Lexikon."

the wild, speculative mood of the conceptual world-constructors, and Bayrholder gratefully acknowledges his indebtedness to him in this and other respects.

Herbart, then, declined to adopt Fichte's fundamental idea that the world is altogether a creation of the productive imagination of the Ego. Nor did he adhere to Schelling's teaching, that the constitution and meaning of nature may be discovered by watching the objective side of the content of thought, as it is welling up into individual consciousness from the depths of Being. He, trusting to sense-conveyed experience, accepted Kant's doctrine of things-in-themselves; the doctrine, namely, that external powers are affecting our sensibility and compelling from outside the specific content of our definite percepts. But Herbart did not with Kant declare these external powers to be wholly unknowable. On the contrary, he very rationally concluded that the changing relations between the different elements of our percepts must have their cause in determinations appertaining to that which is indefeasibly given to us from outside, and the changing appearances of which may therefore be apprehended by our thought as specific manifestations of veritable reality.

Bayrholder's naturalistic bent inclined him to follow in his questionings of nature much more closely Herbart's method of *sensible* intuition, than Schelling's method of *intellectual* intuition. Yet his philosophy remained, as already stated, Identity-Philosophy to the end; for material phenomena and mental phenomena he both conceived as equally and primordially grounded in absolute Being; material *phenomena* or compelled percepts representing sundry results of the eternal interaction between the elements of such Being, as they appear consciously reflected within those specific parts of itself called animal brains; and mental phenomena, at large, being simply the entire range of such reflected interactions in the same organized medium. All this will sound, at present, very enigmatical to the uninitiated, but will be better understood when we come to develop our philosopher's ideas of the nature of matter and mind.

Another consideration was urged by Herbart in opposition to the constitution of Being by pure mental activity; a consideration which may now again prove opportune, if applied to themselves by those philosopher's of various schools, who are renewing the attempt to dissolve all Being into pure relativity; into the mental apprehension of nothing but conceptual relations in the transcendental camp; and into mere states of interactivity in the naturalistic camp.

Herbart reminded the philosophical world that all determinations of an existent, which reveal themselves only in connection with other existents, such as motion, distance, in fact all sensible positions and changes of things, can be merely phenomena of relation, not facts appertaining to the essence of absolute Being.

These anti-Hegelian hints of Herbart were never forgotten by our Wisconsin philosopher, and it will presently be seen how he made use of them in his dynamical construction of reality. For his profound interpretation of sense and thought-revealed nature constitutes a system of naturalistic Monism, in which the material world results from the play of dynamical powers; not from pure intellectual activity, nor from inert atoms knocked about by motion imparted to them from outside. And in this connection it is incumbent on us to remark, that it was also from Herbart that Bayrholder took up not only his dynamical, but also his monadistic view; the view, namely, that the phenomena of nature arise by force of powers intrinsically belonging to a multitude of discrete elements, constituting absolute Being; and not, as taught by the mechanical interpretation of nature, through mere changes of relation in time and space, imposed from outside upon atomic elements, that are themselves intrinsically passive and unchangeable.

Having now sufficiently, though really only very cursorily, analyzed the philosophical pabulum, from which the thinking of our true, fearless and enthusiastic philosopher drew its principal nourishment during the time of its growth, we will try in a following article to give a concise exposition of his own well-matured ideas.

#### MONISM AND RELIGION.—A CRITICISM.

BY D. THEOPHILUS, M. A.

THE OPEN COURT having been established with the main purpose in view of discussing the relationship of religion and science, and, if possible, of effecting a satisfactory reconciliation between them; and as various articles have already appeared on the constructive side of the question, and none, so far as I know, on the destructive or critical side, a few words framed in the latter mood, in the way of objections to some positions already advanced, may possibly not be altogether an unwelcome reading. An article conceived in the latter spirit, if it accomplished nothing else, might, at least, help to relieve the uniformity or monotony of the discussion.

And since reading Mr. Hegeler's article in No. 25 of this journal, welcoming opposition, I more confidently offer my contribution.

In various numbers of THE OPEN COURT, particularly Nos. 13, 15, 24 and 25, it has been laid down as an accepted scientific conclusion that there is no antagonism between science and religion; nay, that the latter is a necessary and inseparable adjunct of the former. To this proposition I am constrained to take exception. The result of a somewhat close study of this question during the last twenty years forces upon me a different conclusion.

Dr. Carus in his article on Religion and Science (No. 15, OPEN COURT) apparently would have us be-

lieve (by implication at least) that prior to the time of the scholastics of the Middle Ages religion and science were not antagonistic. The notorious fact, however, is that wherever and whenever, in the world's history, there arose a science distinctively formulated, it invariably and inevitably clashed with religion. Each has occupied a sphere of its own. And the advocates of each, up to the present century, with one or two exceptions, have been perfectly satisfied with the opposition, and, what is more, coveted no reconciliation.

This fact is nowhere more apparent than in the early history of the Christian religion. Throughout the writings of Paul the opposition is emphasized by such marked contrasts as, Christ and Belial; light and darkness; the spirit and the flesh; kingdom of God and kingdom of the world. To Paul science was simply foolishness and sin in the sight of God. And precisely the same it was to Tertullian, Jerome and Augustine and the majority if not all of the Christian Fathers. All their science was contained in the revealed word: all other teaching that did not harmonize with it was simply of the devil and therefore false.

Dr. Carus' statement, therefore, that the separation of science and religion originated with the scholastics of the Middle Ages, is at variance with historic facts. It would be much nearer the truth to state just the reverse, that with the scholastics originated the idea of reconciling the two. And indeed that is the simple fact.

Scholasticism was a Christian philosophy, called into being with the avowed object of conciliating dogma and thought, faith and reason, religion and science. And the way whereby it sought to realize its aim was by rationalizing the dogma, so as to harmonize it with reason and fact.

Scholasticism rested upon, at least, two presuppositions: first that the creed of the church was absolutely true, and second, that a union between reason and faith or religion and science was possible, nay necessary: for the simple reason that truth must be uniform: the same thing cannot be and not be at the same time.

If the conclusions of science conflicted with the doctrine of the church, it was the duty of philosophy to expand or contract it, so as to reduce it into concord with the scientific fact. If, however, finally harmony was not secured, this was a clear proof, not that the two factors were irreconcilable, but that the alleged scientific fact was false. All true science agreed or could be made to agree with the dogma.

Thus the reconciliation of reason and faith, brought about by scholasticism, was not real, but apparent: it was obtained by doing violence to the terms it sought to reconcile; by depriving one of them of its real and independent existence. Virtually, science was comprehended under, or merged in, theology. As soon as science began to assert its independence, and claim, at least,

equal authority with theology, the fictitious character of the alleged union manifested itself. And forthwith the breach between the two became marked and decisive. Each began to assume toward the other a defiant front, tempered only by a love of peace. Hence a compromise was acquiesced in—a truce agreed upon. And this virtual compact was expressed in the formula: True to science, but false to theology; or *vice versa*.

Having won a right to an equal authority with religion, and emboldened by that success, science was not long before it attempted another conquest. It now claimed for itself the sole authority over the entire realm of knowledge, and treated its antagonist as a mere usurper. This characteristically marks the epoch, the character and the attitude of modern science.

The separation between science and religion was not brought about intentionally by scholasticism, as Dr. Carus claimed, but was accomplished in spite of it: it was due to the rise of science and the fall of scholasticism.

What is especially worthy of note here in connection with this abortive attempt at reconciling religion and science is the fact that it is the exact prototype of all subsequent like attempts; and that of Dr. Carus among them.

All methods of harmony followed ever since, like their forerunner in the middle ages, rest upon a presupposition or presuppositions, as a basis; they assume, at least, that a reconciliation is possible and desirable, nay, according to Dr. Carus, likewise necessary. The only ground, however, for this assumption, so far as I am able to discover in the articles above referred to, is to be found in another assumption, the statement that "religion is an ultimate fact of human nature." But whose human nature? I would ask, and human nature at what stage of development? Human nature is a very elastic expression. It covers a vast amount of heterogeneous elements and capacities. There is an immense difference between the nature of a savage or semi-civilized, or even of a civilized man, and that of the highly developed man of culture. What suits or satisfies the nature of a child or that of a savage is unsuitable and unsatisfactory to a man who has reached a higher state of development. The doings and requirements, therefore, of the "human nature" of a savage, a child, or indeed of the ordinary civilized man are no criterion whereby to judge of the needs and activities of the "human nature" of a Strauss, a Kant, a Feuerbach, a Grote, a Bain or of a Mill. These men and thousands of others like them have outgrown the need of religion. There is no void in their human nature which religion can fill. Their nature demands different nutriment from that of the savage, the semi-civilized or even that of the ordinary man of civilization. The argument, therefore, based upon the above assumption must fall to the ground, as the assumption itself implies a fallacy: the fallacy lurking in the ambiguity of the expression, "human nature."

The method of procedure adopted by Scholasticism in effecting a reconciliation, consisted in suppressing one of the terms or in tampering with its meaning. Science had no real standing except within the domain of religion. Precisely the like tactics have been adopted by later harmonists, with a difference only in the term suppressed. It is now generally religion that has to undergo a limitation and has its meaning tampered with, while science is exalted to the former's position in the middle ages. The authority of science is supreme and absolute, that of poor religion is nill. She is simply the humble *ancilla* (maid servant). Whatever existence is permitted it, is only in name and not in fact. So the problem of reconciling science and religion becomes easy enough. In fact there is nothing to reconcile, for there is but one term left.

That, to my thinking, is just the issue that is presented to us in the columns of THE OPEN COURT. Dr. Carus defines religion as man's consciousness of his relation to the All (OPEN COURT, No. 24). But this implies nothing more than an intellectual act or process. And the result is a mere acquisition of knowledge. Where, then, is the difference between religion and science? The definition might be a correct definition of philosophy or metaphysics, but not of religion; certainly not of religion such as we have known in our own experience as well as the collected experience of the past, as expressed in tradition and literature. And this is the only idea the world is interested in, and the only idea it wants to see reconciled to science; or if a reconciliation is not feasible, to have it so understood.

In Dr. Carus' scheme this essential idea, the idea for which the word religion is the symbol, the idea which has been palpable before the world, and remained fixed in the speech and literature of civilized and semi-civilized nations for several thousands of years, under whatever name symbolized; this idea in Dr. Carus' harmony is ignored or rather utterly eradicated, and another is quietly substituted in its stead, to which he labels the old familiar symbolic epithet—religion; and then proceeds to show that this latter is not antagonistic to science. As a result he gives us a solution of a different problem from the one he had undertaken to solve.

Religion, doubtless, has ever rested on an intellectual basis—a belief or a knowledge, true or false. But the object of such a belief or knowledge has invariably been of a definite and uniform character. It has possessed attributes in which mankind have vital interest, and of which the simply vague term, "The All," is wholly destitute. This object has been, at least, an intelligence, supreme, yet analogous to the human, a personality other than the world, possessing a will and power to put it in execution in the control of human destiny.

In addition to this intellectual act or belief, there is also present in all religion another factor, namely, the

effect of this conviction in man's feelings and conduct, manifesting itself in an emotion, such as awe, fear, reverence, love, dependence, accompanied generally with acts or exercises calculated to give due expression to such feelings.

Whatever else the word religion or its equivalent in other languages may connote, the two factors just mentioned are necessarily and inseparably connected with it. And in confirmation of this I simply appeal to the unsophisticated beliefs and opinions of mankind of all nations, during the last three or four thousand years, as these are recorded in literature of those nations.

These two features, I repeat, are inseparably bound up with the idea of religion. And if you deprive the word of this its essential and unalterable content—content which it has borne for thousands of years, and by which it has been known to minds of all degrees of culture; to believers and skeptics, devotional men and worldlings; to the philosopher and the man of science in the same way as to the theologian and the untrained thinker; if you now take out of the word that content, you will inevitably and necessarily destroy the fact itself. You will utterly banish religion from the world, and there will be nothing behind except the bare symbol, or the symbol with a new signification; which is not new either, for it is a content borrowed from another word—philosophy or metaphysics.

The word religion is no more susceptible of having its meaning tampered with, without losing its essential nature, than are other words of cognate signification, such as loyalty, awe, reverence, faithfulness, trust, belief, fear, hope, virtue, obedience, etc.

The conception of growth or progress, except in the degree of the emotion, is also altogether alien to ideas connoted by these words. And the word religion partakes of exactly like fixedness; notwithstanding Max Müller's contention to the contrary.

Religion conveyed precisely the same notion to Moses, Isaiah, Paul and the Christian Fathers, as it does to-day to Leo XIII., the archbishop of Canterbury and De Witt Talmage. The meaning attached to it in the minds of Jewish rabbis, Egyptian priests, Indian theosophists and Mohammedan fanatics, was accepted without question by the irreligious, the skeptic and the scoffer, as well as by the philosopher and the scholar. Religion to Lucretius, Celsus and Lucian, was the same as it was to Cicero, St. Augustine and Marcus Aurelius. What it signified to Calvin and Luther, the same it did also to Voltaire and Paine. It is only within the present century, and especially the latter half of it, that diversity of opinions has been entertained as to its true character, and that chiefly among metaphysicians and minds imbued with liberal thought. And this in itself is a significant fact. It is sufficient to arouse distrust as regards the motive which impels the compromisers to examine anew the

ground of religion and seek for it some other foundation in human consciousness than the old one—some position which science cannot undermine. It is a similar motive that in the middle ages prompted the advocates of science to compromise with the theologians for the sake of peace. Now it is the religionist that desires to compromise. In each instance it is the weaker party that hoists up the flag of truce. But in resorting to a compromise the religionist is constrained to surrender all that really constituted religion—all save the name.

The truth is that a reconciliation of religion with the prevailing scientific conception of the world is impossible, for religion has been founded on Dualism; it postulates an anthropomorphic god as the first and indispensable condition of its existence. No other conception will be of any avail. No other conception of a God will prove capable of supporting a religion. No vague somethings or nothings will answer the purpose. The Unknowable, the Thing in Itself, the Infinite, the Unity in Difference, the All, the Great Being of Humanity, each and all fall short of the requisite potency to give meaning and life to religion. None of these are capable of constituting a God such as the religious instinct demands.

A God set up with either of these entities stands in just as much chance of becoming an object of religious zeal or aspiration as the law of gravitation or the fourth dimension does. People would be as likely to worship, fear, love or reverence "The All" or the Unknowable or even the Great Being of Humanity as they would a tom-cat or an Egyptian mummy. No conception, I repeat, except the anthropomorphic, affords a sufficient ground for religion. Banish dualism from your head and religion will necessarily vacate the heart.

#### SUPERSTITION IN RELIGION AND SCIENCE.

The criticism by D. Theophilus,\* published in the present number of *THE OPEN COURT*, was very welcome because it comes from an able pen. The article, as we learn from the accompanying letter, is written by a man who studied theology and is well versed in theological questions. He does not side with religion but denounces it as superstition. His criticism, I believe, is valuable, and it deserves publication and our full attention, as it states the opinions of a large number of free thinkers; and many of our readers, I do not doubt, will find therein a fair and scholarly expression of their views.

Before I enter into a discussion of the subject let me mention that years ago I cherished exactly the same opinion as Theophilus. As a child I had been a faithful believer in Christianity, the dogmas of which I had been taught to consider as absolute truths. When my faith in these dogmas was shaken, I was almost on the verge of despair. The purpose and aim, the content

and the value of my aspirations were lost. All was desolation and my life empty. In this period of my life I identified Christianity and superstition, faith and credulity, religion and dualism. It was not until I had, through many experiences, advanced on the thorny path of inquiry and thought, that I regained the equipoise to judge justly of religion and to learn that the errors through which I had passed were everywhere common experiences in the lives of individuals and in the development of nations. I found that there was some truth hidden in the old superstitions, and accordingly that a wrong interpretation of religion does not justify us in discarding religion altogether.

When I lived in Germany I once had the pleasure of being received by a Buddhist high priest, who was sent by the government of Japan to study European religions. He had read two of my publications, which perhaps might have been and indeed were denounced by orthodox minds as irreligious. He considered them worthy of his notice for the sake of religion.

My conversation with this venerable and learned man, who came from a country to which we send missionaries, gave me much food for thought. He was not hampered by any creed; his Buddhism does not prescribe any dogma to be believed in. He was well read in the philosophy of Plato and of Kant. At least he referred to their idealistic doctrines in a way which proved that he knew of what he was speaking. He said: "Our difficulty in Japan is to educate a clergy who can be the teachers and advisers of the people, who can assist them in their troubles, comfort them in afflictions and miseries, and elevate their minds when they are happy and prosperous."

There are moments in life when not only the uneducated but also, and perhaps even in a higher degree, the more educated classes need the spiritual support of a fatherly friend. Of such moments there may be mentioned as the most prominent, the entrance of a child into life, marriage and the last honors to the dead. The actions of every individual have a definite reference to the healthy life and growth of the community and of humanity in general. The individual should know it and must be conscious of it. Therefore those actions of ours in which this our relation to a greater whole is unusually marked and noticeable, must be sanctified so as to remind us of their importance. We need appropriate forms for these actions and cannot dispense with them. These forms, however, should harmonize with the civilization of to-day and be free from dogmatism and superstitious notions.

If a man like this Buddhist high priest comes to us to study the religious problem shall we tell him: Religion is simply superstition. Go home and abolish religion altogether. By doing so you Japanese will be far ahead of us.

\*For all I know the name may be a pseudonym.

The leading mistake of Theophilus is that he criticizes religion as he defines it, not as it is defined in THE OPEN COURT. He defines religion as a belief in a supernatural deity and declares that it is founded on dualism. But how can religion be identified with the belief in a supernatural deity, since Buddhism, whose adherents are the most numerous on earth, is an atheistic religion?

If scholasticism failed in its endeavors to reconcile religion and science this failure does not prove that the two factors are irreconcilable. It proves that the method of the schoolmen was wrong. They indeed never tried to reconcile religion and science, but the dogmatism of the church and the dogmatism of Aristotelean philosophy. Neither should the former be identified with religion nor the latter with science.

In a certain sense it is true that 'Religion conveyed precisely the same notion to Moses, Isaiah, Paul and the Christian Fathers as it does to-day to Leo. XIII.' And in a certain sense also science conveys precisely the same notion to Aristotle, Ptolemy and Kepler as it does to-day to our scientists. The religious spirit and the scientific spirit remain, or at least should remain, the same, although the meaning of words and their definitions change until after a longer or shorter process of evolution, when a certain stage of maturity is reached they perhaps become fixed for all times.

The objections made by Theophilus appear to me as if someone were criticizing modern psychology, who defined psychology as an inquiry into the properties and substance of the soul. Then the critic, being averse to dualism, declares that the soul does not exist independent of the body, that soul-substance and soul-properties are superstitious notions, *ergo*, all psychology is based on error and has no title to existence. The truth is that the old dualistic interpretation of the functions of the soul are erroneous; all the psychological terms and even the definition of psychology itself, as stated by the old school, are now proven to be fundamentally false. All this conceded, is any critic justified in saying that psychology is a superstition?

During the last few centuries all the sciences have been revolutionized by new discoveries, just as our civilization has been modified by the many inventions made in all branches of life and labor. It is but natural that religion also should be revolutionized and based upon other principles than heretofore. This will be accomplished whether we champion or oppose the new view of religion, for it is the outcome of an evolutionary process in the growth and development of mankind.

The fact is well-established and yet little appreciated that science has just as well its orthodoxy as religion. Science in former centuries was just as dualistic as religion. And the history of civilization is the slow process by which man frees himself from superstition. Super-

stition is not necessarily a religious error. By far the most numerous superstitions are scientific superstitions. Superstition is the assumption of an error as if it were an axiomatic truth; and one of the most important causes of superstition is the dualism of former centuries. Those who cherished their superstition as absolute truth assumed the name orthodox, viz., the men whose view is correct. They denounced the heterodox as revolutionists who destroyed science as well as religion.

Copernicus, Kepler, Galileo and other great scientists were to the scientists of their era heterodox, just as Luther was denounced as a heretic and infidel by the church. Socrates was executed because he was said to be irreligious, and Christ was crucified for blasphemy.

If to-day a scientist would try to establish a new—although correct—explanation of certain natural phenomena, which appeared to be contrary to the present views of his colleagues, it is certain that his theory would for a long time be rejected and ridiculed. La Marck and Darwin have experienced the truth of this fact. Only by great efforts did they and their followers overcome the old superstition of the orthodox pharisees of science.

The superstition of former ages, the erroneous dualism which boasted so much of its infallible orthodoxy, was not only an attribute of the religion of the middle ages but also of its philosophy and science. It is but a few decades since physiology got rid of the dualistic view of a life-principle, or vital power. Even to-day our chemists speak of organic and inorganic chemistry, as if two different kinds of elements existed, the living and the dead. This view and its whole terminology are but scientific superstitions.

It is not the place here to point out why the path to truth necessarily leads through errors. Nor can we here explain at length how the errors of old—far from being absolute errors—were the germs of truth. They contained golden grains of truth, and the faithful enquirer winnowed them until the grain was separated from the chaff. Thus Copernicus and Kepler were guided in their great discoveries by the old superstitious notions of the Pythagorean philosophy. They believed *a priori* in the harmony of the spheres.

Also another fact can only be hinted at: Humanity does not consist of single individuals but forms one great unity. The single individual is merely the representative of the ideas of his age, which are the results of a long process of evolution. This will easily explain why certain ages bear a certain uniform character.

There are, no doubt, exceptions. Some men are greatly in advance of their times and some lag behind. But such exceptions confute our argument as little as cases of atavism overthrow the theory of evolution.

I argued with many different persons upon the topics of religion and science, and found that apart from

a difference of definitions, fundamentally they held almost the same opinions. The atheist and the monotheist have different definitions of God. The former rejects, the latter accepts, the idea of God, but *de facto* both agree much more than they are themselves aware of. The Roman Catholic priest of to-day and Robert Ingersoll are more alike in their *philosophical* views than is generally supposed, but we must eliminate the differences of their terminology and translate the language of the one into that of the other. A free-thinker of to-day differs much more from a free-thinker of mediæval times than from an orthodox believer of to-day; and a Lutheran clergyman differs in the same degree from Luther himself. What Lutheran clergyman would throw his inksstand at the devil or order a misformed babe to be drowned, because it may perhaps be a changeling? What Calvinist of to-day would burn a man who had a peculiar idea of the Trinity of God. The shortcomings of religious men are not errors of religion; just as the *ignis vitæ* was not an error of science. Errors and superstitions are errors of men and of their times, and our own time has likewise its full share of them. The scientific and the religious spirit is constantly endeavoring to free humanity from its many errors.

Taking this ground, I fail to see why religion should be identified with the errors of the past and science credited with all the great ideals of the future. Why shall not religion just as well as science be freed from the shackles of superstition? Absolute truth never existed either in religion or in science. Scientific definitions and religious dogmas have changed from century to century, but the religious spirit and scientific spirit remained the same. The scientific spirit is characterized by a pure love of truth, and true religiosity means man's consciousness of being in unity with the whole Cosmos—whether it is called the All or God, Brahma or Nirvana or even Nought. The religious sentiment is a powerful factor in every human being. It prompts us to live in accordance with what we call ethics, and by it our ethical instincts must be explained. The professedly irreligious possess this religiosity sometimes stronger than those who profess a certain religion. Call it other than religion, if you please, but the rose would be a rose with any other name. In this sense Schiller said:

"Which religion I have? There is none of all you may mention That I embrace; and the cause? Truly, religion it is!"

The religious spirit and the scientific spirit are so much in harmony that one cannot exist without the other. All the prominent men of science were sincerely religious—they were not orthodox; how could they be so narrow-minded if they were to be the representatives of progress? They were intoxicated, as it were, with their zeal for truth. They felt that the heart-blood of human progress was throbbing in their veins. A greater power than themselves had taken possession of them.

They were conscious of working and suffering for a great cause, in comparison to which their individual loss and anxieties were but fleeting trifles. The same can be said of great artists. Such sentiment is the true religious spirit of which Goethe speaks:

*Wer Wissenschaft und Kunst besitzt,  
Der hat auch Religion.*

*Wer aber beide nicht besitzt,  
Der habe Religion.*

The man who science has and art,  
He also has religion.

But he who is devoid of both,  
He surely needs religion.

And this leads us to another point. Science is the privilege of the few, but religion may be had by the masses. Not everybody can be a scientist, but everybody can be and should be imbued with the true religious sentiment. Religion is not a deep philosophy, it does not take the profound learning of a scholar to recognize that the individual is but a part of a greater whole. Every child can know that; and every child should know it, not by being taught so at school, but by seeing its parents act accordingly.

A true scientist and a great artist conceive that all natural phenomena are but so many instances of the HAN KAI'EN. Nature is one and the same everywhere. Science and art are based upon this truth. Accordingly, every true scientific man, every great artist must *eo ipso* be possessed of the right religious spirit. However, those who cannot intellectually grasp this truth, must needs be religious or they will sink below the level of the savage and the brute.

What we want is religion for the masses; not orthodoxy to make them bow down and worship idols, but a religion that makes the individual feel himself the representative of a higher power, of his community, of his nation, of humanity. A nation in which the masses are religious in this sense will be truly republican, for every citizen will be a representative of the sovereignty of the nation—of the sovereignty with all its prerogatives as well as its obligations.

#### PARABLES.\*

BY HENRY BYRON.

##### I.

#### THE INFORMER.

In our village there lived a bad man, an informer. As we Arabians are governed by strangers† and as we hold, not always with justice, incidents occur in our communities which, we think, we have good reason to conceal from the government. To discover such secrets and betray them for pay to the authorities was the work of the informer. If he succeeded, (which was but too often the case,) imprisonments, fines and still heavier

\* Translated from the Arabian.

† The Turks. (The Translator.)

punishments followed, and grief and sorrow reigned all through the community.

But the informer was overtaken by a disease which proved fatal. Shortly, however, before he died he sent for the principal citizens and spoke to them thus: "I have sinned against God and against you all my life long and you now see me repentant and contrite. The Allmerciful will forgive me, poor, repentant sinner—for His grace is infinite. But I fear I have transgressed too much to expect forgiveness from men. Grant me, however, I pray you, one request! When you carry me to my last resting-place lay a stone on my bier. This stone will be the emblem of the heavy load with which remorse, in the hour of death, burdens my heart. Perhaps some one who has sighed under the burden of remorse himself will take pity on him who lies stretched under the stone and will not curse his memory."

The principal citizens promised the dying man to fulfill his last wish and on the following day a bier, covered with a pall on which lay a heavy stone, was slowly carried through the streets. As is customary in such cases whenever a funeral passed, everyone left his occupation instantly, closed his shop and house-door and followed the procession. Again, as is customary, solemn stillness and silent mourning reigned everywhere. Had not the man now lying in his coffin done much injury to almost all who followed him to his grave? Where was the hate, the contempt for the informer, the terrible scourge of the community? There lay the stone on the pall and not one had an evil word, an evil thought for the man lying underneath.

But when the procession approached the burial-ground a wild cry: "Profanation of the dead!" rang through the air and in an instant they were surrounded by fierce Turkish mercenaries. "They want to revenge themselves on the dead!" shouted the hirelings; "on our friend who used to reveal their tricks to us! The dogs!" and they carried off the principal citizens to prison.

Again a sea of troubles rushed on the poor village.

The sinner had repented; he was dead; his sins were forgiven by God and men; but the consequences of sin remained.

#### WHAT DO TH REMAIN?\*

A great light glowing into life,  
A great warmth conquering in the breast,  
A great joy drowning care and strife,  
A great pang shading into rest.

And what is this that doth remain,  
Large, sweet, and luminous and sure?  
A joy by joy begot through pain,—  
Through pain immortal made, and pure.

\* Selected from *Poems by David Atwood Wasson*. Boston: Lee & Shepard; 1888.

## CORRESPONDENCE.

### AN INQUIRY CONCERNING IMMORTALITY.

To the Editor:

ITHACA, N. Y.

Sir, at the close of an editorial in *OPEN COURT*, No. 26, on "The Life and Growth of Ideas," occur these words: "When we are gone, the ideas remain. We die, but our better self, our ideas, can be immortal."

I think it is the teaching—now generally accepted—of the wise ones, that this globe which we inhabit is constantly, though slowly, losing its heat and moisture; and that there is coming a time, measurable by years, when from this cause all life upon its surface must cease, and the earth become as tenantless as it was at its beginning. Now, if this opinion of the wise is well founded, how can our *ideas be immortal*, or have any but a comparatively brief existence? Very truly,  
S. BREWER.

[The cell, which constitutes an almost infinitely small part of our body, dies away; but biology teaches that it lives in its filial cells. It has not lived in vain. For instance, the liver cell (as Professor Hering informs us in his essay, Nos. 22 and 23 of *THE OPEN COURT*) has acquired from its ancestors, from liver cells, the specific energies of their function, and transmits these energies to its descendants. If the cell dies, its structure, as it is produced by and has been adapted for a special function, is preserved. And this structure, this special form, is the cell and not the constantly changing material elements which constitute it in a certain moment. Granting this, you may say: That is no immortality, for the body of which the cell is a part will die, and thus after all the cell will have only "a comparatively brief existence." Certainly this immortality is not so much an absolute negation of mortality as a positive continuance after death.

What is true of the cell is true of man. The individual dies, but he persists in his children, he lives in his works and will continue to exist in humanity.

You accept this, but you declare that this world will also pass away. However, you should bear in mind that our world may exist for many millions of years and we may be sure that the human race has not as yet attained to full maturity. The immeasurable ages before us appear almost as an eternity. And to ponder on the persistence of life and its forms after the destruction of this world, seems to me the same as if a child worried about the fate of his grandchildren. But although we cannot form any definite idea concerning the final fate of our planet, we may be sure that the earth has a similar immortality, as has the cell in the individual, and the individual in the race.

There is no death in the old sense of the word, as there is no birth in the sense of a creative beginning. Both are transitions, both are changes of form. If there is death, we are constantly dying and constantly new-born, for, then, death is life. Editor.]

### NO INDIVIDUAL INCOME TAX.

To the Editor:

NEW YORK, March 10, 1888.

Under the caption of "National Taxation," Anti-monopolist has made a clear demonstration of the injustice of tariff taxes, but whatever merit his negative position has is marred by his attempt to construct a tax in place of the one displaced.

Why did he spoil his article by any such proposition as "individual income tax"?

He disposes of the justness of this tax in a few lines; as if it was self-evident:

"A man with a larger net income claims and enjoys the protection of the government for it to a larger extent than a man with a smaller net income."

This was all—or all at least that I could discern—advanced in justification of the tax.

His supposition is that the national government is a watchdog for property, and yet he says further on:

"There are those who say that a national income-tax would cause a good deal of perjury in this country.

"Yet it is the American tax that, if permanently established, would soon render the American people 'truthful' as to its payment. The truthfulness of a free nation can be affected only by erroneous legislation, in favor of classes of the people, but never by a just, sound, and uniform tax for the support of a government of the people, by the people and for the people, as our national government, and also every American state and municipal government, happily is this."

If this tax is to make people honest it would necessarily follow that property needed no further protection and consequently no tax.

We are compelled to suppose that the people will pay the tax, for if they don't want to, they can easily evade it, and only honest people would pay it, thereby encouraging dishonesty.

But, Anti monopolist contends, they will pay, because they recognize the fairness of the tax; why, then, do you advocate the swearing of citizens, and if they will not then submit a true report, punish them even unto a deprivation of liberty?

This sounds much as if he even doubted the honesty of the payees of the tax.

Again, if the tax is levied because of the protection the government extends over property, and the greater the property the larger the tax, it follows that all who possess sufficient property to bear a tax shall, regardless of everything else, have a voice in saying how and in what manner the property is to be protected, and disfranchise all who pay no tax, since they have no property to protect. Citizenship would then depend upon a property qualification.

Anyway the proposition is void since the state government is invested with the complete police regulation.

It is true that persons shall pay taxes to the extent of the privileges the government affords them—merely voting is not a privilege, since it presupposes something to choose. It is simply a means to an end.

The privilege a person enjoys in this or any other country is the privilege to hold exclusive possession to some portion of the land. Since all have an equal right, none can appropriate to themselves the choicest portions unless they render back to the community an equivalent for the superior advantages they hold, which shall be expended for the general good.

My desire is to be an anti-monopolist; therefore I am compelled to be brief and not press too much matter into this reply; otherwise I would explain the advantages of this tax in detail.

BENJ. DOBLIN.

## BOOK REVIEWS.

PATRICK HENRY. American Statesmen Series. By Moses Coit Tyler. Boston: Houghton, Mifflin & Co.

This series of compact useful biographies has long since established itself in popular approval, and but little more is needed by the reviewer than to call attention to the appearance of a new number in a collection of works of equally high order and even execution throughout. Patrick Henry, the fervid orator and sound statesman, is one of the most picturesque characters in American history; and with a writer of such qualifications and pleasing style as Prof. Tyler to present us with fresh knowledge of the subject, the reading of this book is sure to be as entertaining as profitable.

Prof. Tyler embodies considerable new material in his work, as there was opportunity to do, inasmuch as the biography of William Wirt, written as far back as 1877, is the only work deserving to be called a memoir of Patrick Henry that we possess.

In the second chapter the author deals with what he calls "the Jeffersonian tradition of Patrick Henry's illiteracy," which he considers "far too highly tinted." Without attempting to prove that the brilliant orator was a "bookish person," he shows very conclusively that he was fairly well grounded, according to the standard of the period in which he lived, in the fundamentals of education, including considerable knowledge of the classics. In religious matters Henry did not share the "fashionable skepticism" of the times, as derived from contact with the free-thinking nation of France, and more directly introduced into this country in the teachings of Jefferson and Paine. He wrote a treatise in refutation of Paine's "Age of Reason," which, however, he afterwards destroyed, being distrustful of the literary merit of the work. The life of Patrick Henry covered the most eventful period of our early history, and in addition to the new knowledge we gain of the main subject, Prof. Tyler has given us a clear and intelligent review of the general condition and outlook of affairs during the early formative years when our national life was beginning to shape itself.

C. F. W.

POEMS. By Edward Rowland Sill. Boston: Houghton, Mifflin & Co.

Mr. Sill has long been known among lovers of good verse as one of the best minor poets of the day. He is doubtless best known to the general public by the short poem, "The Fool's Prayer;" but though we share the universal admiration for this specimen of the poet's work and feel the real power and inspiration it contains, we do not place it above other short poems, such as "Opportunity," "Dare You" and "Strange."

The opening poem is entitled "The Venus of Milo," and is a dissertation in musical rhyme on celestial and earthly love, represented in the deities of contrasted beauty and power over men, the Medicean and the Mellan Venus.

"Larger than mortal woman I see thee stand,"

he apostrophizes the last-named goddess,

"Placid thy beams as that still line at dawn  
Where the dim hills along the sky are drawn."

Though this type of purer love abides on earth, it has not replaced that of the other Aphrodite, daughter of the sea-foam:

"From our low world no gods have taken wing,  
Even now upon our hills the twain are wandering,  
The Medicean's shy and servile grace,  
And the immortal beauty of thy face."

But he has learned by bitter experience the false and fleeting happiness "that lesser Aphrodite" brings, and turns to pay the full homage of a tried and believing soul to her nobler sister. Here he will remain

"Till the dim earth is luminous with light  
Of the white dawn from some far-hidden shore,  
That shines upon thy forehead evermore."

This little collection of poems will be welcomed not only to old readers who have long known and prized the author's work, but to all lovers of high, ennobling verse.

Mr. Sill never chooses an ignoble theme, nor does he write in the stiffly serious vein of the didactic poet. He is a reflective, hopeful observer of men and things, with the power of giving musical expression to his thoughts that lingers long and lovingly in the reader's ear.

C. F. W.

A PHYLLIS OF THE SIERRAS. By Bret Harte. Boston: The Same.

This is a story written in the author's usual vein and dealing with the same materials of Western life and scenery which distinguish all his writings and make up his native literary health. "A Phyllis of the Sierras" is published in uniform size with "Maruja" and "Snowbound at Eagles," and will receive immediate welcome and perusal from Mr. Harte's numerous readers. The volume contains two stories, the second being entitled "A Drift from Redwood Camp."

C. F. W.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER IX.—*Concluded.*

The noise was silenced, and a brown gypsy woman, not smaller than Ilse, with shining hair arranged in braids and a colored handkerchief on her head, came out from the band, and stretched her hands toward Ilse.

"My children beg," she said; "they hunger and thirst."

It was a large face with sharp features, in which traces of former beauty were visible. With head bent forward, she stood before the young lady, and her sparkling eyes passed peeringly from one countenance to the other.

"We have money only for the men who work for us," answered Ilse, coldly. "For strangers who are thirsty, there is our spring; and to those who are hungry we give bread. You will get nothing more at our house."

Again dozens of arms were raised and again the wild crowd pressed nearer. The gypsy woman drove them back by a call in a foreign tongue.

"We wish to work, Fräulein," she said, in fluent German, with a foreign accent; "the men mend old utensils, and we drive away rats and mice from the walls; and if you have a sick horse, we will cure it speedily."

Ilse shook her head negatively. "We do not need your help; where is your pass?"

"We have none," said the woman; "we came from foreign parts," and she pointed to where the sun rises.

"And where will you rest to-night?" asked Ilse.

"We do not know; the sun is going down and my people are weary and barefooted," replied the gypsy woman.

"You must not rest near the farm nor near the village houses. The bread you will receive at the gate of the farm-yard; you may send some one there to fetch it. If you light a fire in one of our fields, take care not to go too near the sheaves; we shall look after you. Let none of you stroll about the property or into the village to tell fortunes to people, for we do not permit it."

"We do not tell fortunes," answered the woman, touching a small black cross which she wore round her neck. "None here below know the future, nor do we."

Ilse bent her head reverently.

"Well said," said she. "According to the meaning which seems conveyed in your words, you do not remind me in vain of the communion which exists between us. Come to the gate yourself, mother, and expect me there; if you need anything for your little ones, I will endeavor to help you."

"We have a sick child, my pretty young lady, and the boys are in want of clothes," begged the gypsy

woman. "I will come, and my people shall do as you wish."

She gave a sign, and the wild troop tramped obediently along the side road that led to the village. The friends looked with curiosity after the band.

"That such a scene should be possible in this country I could never have believed," cried the Doctor.

"They were formerly quite a plague to us," replied Ilse, with indifference; now they are scarce. My father keeps strict order, and that they know right well. But we must go back to the farm-yard, for there can be no harm in caution with these thievish people."

She hastened back to the farm-yard. The Doctor lamented heartily that his journey hindered him from obtaining information from the strangers concerning the secrets of their language.

Ilse called the Inspector, and the intelligence that there were gypsies in the neighborhood flew like wild fire over the farm. The stables were guarded, the poultry and families of fatted pigs were given in charge to stout maids, and the shepherds and the ploughmen received orders to keep watch at night. Ilse called the children and gave them their supper, and found it difficult to control their excitement. The youngest were given over to mademoiselle, under strong protest and many tears, to the secure guardianship of their beds. Then Ilse collected old gowns and linen, gave a maid the charge of two loaves, and prepared to go to the gate of the farm-yard, where the gypsy woman would await her. The Doctor, in his joy about the strangers, had cast off all anxiety about his friend.

"Allow us to witness the interview with the sibyl," he begged.

They found the gypsy woman sitting in the dusk before the gate. Near her was a half-grown maiden, with brilliant eyes and long tresses, but scanty dress. The woman rose and received with a distinguished air the bounty which Ilse handed to her.

"Blessings on you, young lady," she exclaimed, and all the happiness that you now wish shall be your portion. You have a face that promises good fortune. Blessings on your golden hair and your blue eyes. I thank you," she concluded, bowing her head. "Will not the gentlemen also give my little maiden a keepsake?" The wild beauty held out her hand. "Her face is burnt by the sun; be kind to the poor dark girl," begged the old one, looking furtively round.

The Professor shook his head negatively. The Doctor got out his purse and placed a piece of gold in the hand of the old woman.

"Have you given up prophesying?" he asked, laughing.

"It brings misfortune to those who prophesy and those who ask," replied the gypsy woman. "Let the gentleman be on his guard against all that barks or

scratches, for mischief will come to him from dogs and cats."

Ilse and the Professor laughed; and meanwhile the eyes of the gypsy woman peered restlessly into the bushes.

"We cannot tell fortunes," she continued. "We have no power over the future, and we make mistakes, like others. Yet we see much, my beautiful young lady; and though you do not desire it, I will tell you something. The gentleman near you seeks a treasure, and he will find it, but he must take care not to lose it; and you, proud lady, will be dear to a man who wears a crown, and you will have the choice of becoming a sovereign; the choice and the torment," she added in a lower tone, and her eyes again wandered unquietly about.

"Away with you," cried Ilse, indignantly; "such gossip does not agree with your words."

"We know nothing," murmured the gypsy woman humbly, grasping the talisman on her neck. "We have only our thoughts, and our thoughts are idle or true, according to a more powerful will. Farewell, my pretty lady," she cried out with emphasis and strode with her companion into the darkness.

"How proudly she goes away," exclaimed the Doctor. "I have much respect for the clever woman; she would not tell fortunes, but she could not help recommending herself by a bit of secret knowledge."

"She has long ago learnt all about us from the laborers," replied Ilse, laughing.

"Where have they pitched their tents?" asked the Doctor, with curiosity.

"Probably beyond the village," answered Ilse. "You may see their fires in the valley. These strangers do not like one to come near their camp and see what they have for supper."

They descended slowly into the valley and remained standing on the border of the brook, not far from the garden. All around them lay the darkness of the evening on bush and meadow. The old house stood out on the rock, gloomy under the twilight gray of the heavens. At their feet the water murmured and the leaves of the trees were agitated by the night wind. Silently did the three look upon the vanishing forms of the landscape; the valley alongside of the village lay invisible in the deep shadows of the night; not one lighted window was to be seen.

"They have disappeared silently like the bats, which are even now flying through the air," said the Doctor.

But the others did not answer; they were no longer thinking of the gypsies.

Then through the still evening they heard a low moan. Ilse started and listened. Again the same weak tone.

"The children!" cried Ilse, in dismay, and rushed toward the hedge which divided the meadow from the

orchard. Much alarmed she shook the closed gate, then broke through the hedge and sprang like a lioness past the espaliers. The friends hastened after her, but could not overtake her. A bright light shone among the trees before her and something moved as she flew on. Two men rose from the ground; one encountered her, but Ilse threw back the arm which was raised to strike her, so that the man tottered and fell back over the weeping children who lay on the grass. Felix, who was behind Ilse, sprang forward and seized the man, while the Doctor the next moment struggled with another, who glided like an eel from under his hands and disappeared in the darkness. Meanwhile the first robber struck at the arm of the Professor with his knife, wrenched himself away from the hand which held him, and in the next moment broke through the hedge. One heard the crackling of the branches, and then all was quiet again.

"They live!" cried Ilse, kneeling on the ground, with panting breath, and embracing the little ones, who now uttered piteous cries. It was Riekchen, in her night-dress, and Franz, also nearly stripped. The children had escaped from the eyes of mademoiselle and the protection of the bedroom and slipped into the garden, in order to see the fire of the gypsies, of which they had heard their sister speak. They had fallen into the hands of some of the fellows belonging to the band, who were looking out for something to steal, and had been deprived of their clothes.

Ilse took the screaming children in her arms, and in vain did the friends try to relieve her of the burden. Silently she hastened with them into the house, rushed into the room, and, still holding them fast, knelt down by them before the sofa, and the friends heard her suppressed sobs. But it was only for a few moments that she lost her self-control. She rose, and looked at the servants, who thronged terrified into the room.

"No harm has happened to the children," she exclaimed. "Go where you have to keep watch and send one of the Inspectors to me."

The Inspector stepped forward.

"This has been a robbery on our land," said Ilse, "and those who perpetrated it should be given up to the law. I beg of you to have them seized in their camp."

"Their fire is in the ravine behind the village," replied the Inspector; "one may see the flame and smoke from the upper story. But, Fräulein—I say it unwillingly—would it not be more prudent to let the rogues escape? A large portion of the harvest still lies in sheaves; they may set it on fire in the night, out of revenge, or perhaps venture still worse, in order to free their people."

"No," exclaimed Ilse; "do not hesitate—do not delay. Whether the vagabonds injure us or not will be decided by a higher will; we must do our duty. The

crime demands punishment, and the master of this property is in the position of guardian of the law."

"Let us be quick," said the Professor; "we will accompany you."

"Take your strongest men from the farm-yard," said Ilse; "Hans and I will watch in the house." She burst open the study door and pointed gloomily to her father's chest of arms. "Take from thence whatever our people require for defence."

"Now I am satisfied," replied the Inspector, after consideration; "the farm bailiff shall remain here and we others will seek the band at the fire."

He hastened out. The Doctor seized a knobbed stick that was in a corner of the room. "That will suffice," he said, laughing, to his friend. "I consider myself bound to show some forbearance toward these thievish associates of my studies, who have not quite forgotten their Indian language." As he was on the point of leaving the room he stopped: "But you must remain behind, for you are bleeding."

Some drops of blood fell from the sleeve of the Professor.

The countenance of the maiden became white as the door against which she leant. "For our sake," she murmured faintly. Suddenly she hastened up to the Professor and bent down to kiss his hand. Felix restrained her.

"It is not worth speaking of, *Fräulein*," he exclaimed. "I can move my arm."

The Doctor compelled him to take off his coat and Ilse flew for a bandage.

Fritz examined the wound with the composure of an old student. "It is a slight prick in the muscles in the under part of the arm," he said, comforting Ilse; "a little sticking-plaster will be sufficient."

The Professor put on his coat again and seized his hat. "Let us start," he said.

"Oh, no; remain with us," begged Ilse, hastening after him.

The Professor looked at her anxious countenance, shook her heartily by the hand and left the room with his friend.

The hasty tread of the men had died away. Ilse went alone through all the rooms in the house; doors and windows were closed; Hans watched at the door opening into the court-yard, his father's sword in his hand; and the housemaids overlooked the court-yard and garden from the upper floor. Ilse entered the nursery, where the two little ones, surrounded by mademoiselle and their brothers and sisters, were sitting in their beds and struggling between their last tears and their sleep. Ilse kissed the tired little ones, laid them down on their pillows, then she hastened out into the yard and listened, now in the direction in which the band lay, now on the other side, where the clatter of horses' hoofs might

announce the arrival of her father. All was quiet. The maids from above called to her that the fire of the gypsies was extinguished, and she again hastened up and down, listening anxiously and looking up to the starry heaven.

What a day! A few hours before raised above the cares of earth, and now by a hostile band dragged back into terror and anxiety! Was this to be a foreboding of her future life? Were the golden doors only opened to be closed again discordantly and a poor soul to be thrown back upon hopeless aspirations? The deceiver had prophesied of one who might wear a crown. Yes, in the realm in which he ruled as king there was a blessed serenity and happy peace. Ah, if it might be permitted to compare the joys of earth with those of heaven, such learning and power of thought gave a foretaste of eternal glory. For thus did the spirits of those who had here been good and wise soar, surrounded by light, in pure clearness of vision, and speak smiling and happy to one another of all that had been upon earth; the most secret things would be revealed to them, and all that was most deeply veiled become apparent, and they would know that all the pains and sorrows of earth proceeded from eternal goodness and wisdom. And he who here trod this earth, a serene heaven in his heart, he was wounded in the arm by a wandering vagabond for her sake; and from love for her he had again gone out into the fearful night, and she was troubled with endless anguish on his account. "Protect him, all-merciful God," she prayed, "and help me out of this darkness; give me strength, and enlighten my mind that I may become worthy of the man who beholds Thy countenance in past times, and among people that have passed away."

At last she heard the quick trot, and then the snorting of an impatient horse at the closed door. "Father!" she cried out, hastily drawing back the bolt, and flying into his arms, as he dismounted. The proprietor was much perplexed as he listened to her rapid report. He threw his horse's bridle to his son, and hastened to the nursery to embrace his little ones, who at the sight of their father remembered their misfortunes, and began to weep and lament.

As the proprietor entered the farmyard, the farming people drew near the house, and the inspector stated "that no one was to be seen near the fire or in the neighborhood. There was no trace near the fire of their having encamped there—it had been lighted to mislead; theft had been their only object here; the greater part of the band had left early in the evening. They are lying concealed somewhere in the woods, and when the sun rises they will be far beyond the frontier. I know the rascals of old."

"He is right," said the proprietor, to the friends, "and I think we have nothing more to fear; yet we

must be very watchful to-night. But a poor father thanks you," he continued, with emotion; "the last day you have passed with us, Doctor, has been unpleasantly eventful, which is not usual with us."

"I undoubtedly depart in anxiety about what I leave behind here," replied the Doctor, half jesting, half serious. "Just fancy some of the lost children of Asia sneaking about these walls!"

"I hope we are rid of the rascals," continued the proprietor, turning to his daughter; "but you may count upon a different visit soon; our sovereign will be here a few weeks hence. I have been called away only to hear gossip about this visit, and to learn that it is not yet decided where his Serene Highness will breakfast before the hunt. I know what that means; the same thing happened fifteen years ago. There is no help for it; he cannot remain at the Dragon at Rossau; but this visit will not cause us any very serious inconvenience. Let us now wish each other good night and sleep in peace."

Both friends entered their bed-room thoughtfully. The Professor stood at the window, and listened to the tread of the watchmen, who paced around the yard, within and without, to the chattering of the crickets, and to the broken sounds which reached the ear from the slumbering fields. He heard a noise near him, and looked into the countenance of his faithful friend, who in his excitement had clasped his hands.

"She is religious," said Fritz, doubtfully.

"Are we not so also?" answered the Professor, drawing himself up to his full height.

"She is as far removed from the tenor of your mind as the holy Elizabeth."

"She has good, sound sense," replied the Professor.

"She is firm and self-confident, in her own circle, but she will never be at ease in your world."

"She has aptness here—she will have it everywhere."

"You blind yourself," cried Fritz, in despair; "will you disturb the peace of your life by a discord, the end of which you cannot foresee? Will you demand of her the great change which she must undergo from being a thorough house-keeper to becoming the confidant of your profound investigations? Will you deprive her of the secure self-dependence of an active life and bring into her future, struggle, uncertainty, and doubt? If you will not think of your own peace, it is your duty to show consideration for her life."

The Professor leant his hot head against the window. At last he began:

"But we are the servants and proclaimers of truth; and while we practice this duty towards everyone who will hear us, is it not right and a duty to do it where we love?"

"Do not deceive yourself," answered Fritz. "You, a man of refined feeling, who so willingly perceive in

every life what befits it—you would be the last to disturb the harmony of her being, if you did not desire to possess her. What impels you is not a feeling of duty, but passion."

"What I dare not demand of strangers, I am entitled to expect in the woman with whom I unite myself for life. And must not every woman that comes to share our life experience a similar change? How high do you place the knowledge of the women in the city who come into our circle?"

"What they know is, as a rule, more uncertain than is good for them or us," replied Fritz; "but from their youth they are accustomed to view the learning that interests men with sympathy. The best results of intellectual work are so easily accessible to them that everywhere they find common ground on which they can meet. But here, however charming and admirable this life may appear to our eyes, it is attractive just because it is so strange and different from ours."

"You exaggerate, and are not correct," cried the Professor. "I have felt deeply in these days that we have passed here, what we easily forget over our books, how great are the rights that a noble passion has over our life. Who can tell what makes two human beings love each other so much that they cannot part? It is not only pleasure in the existence of the other, nor the necessity of making one's own being complete, nor feeling and fancy alone, which joins the object of our love—although heretofore a stranger—so intimately to us. Is it necessary that the wife should only be the finer reed, which always sounds the same notes that the husband plays, only an octave higher? Speech is incapable of expressing the joy and exultation that I feel when near her; and I can only tell you, my friend, that it is something good and great and it demands its place in my life. What you now express are only the doubts of cold reason, which is adverse to all that is to be, and continues to raise its pretensions until it is subdued by accomplished realities."

"It is not alone the reason," replied Fritz, offended. "I do not deserve that you should so misconstrue what I have said. If it was presumptuous in me to speak to you concerning feelings which you now consider sacred, I must say in excuse that I only assume the right which your friendship has hitherto granted me. I must do my duty to you before I leave you here. If I cannot convince you, try to forget this conversation; I will never touch upon this theme again."

He left the Professor standing at the window, and went to his bed. This time he took his boots off, went to the bed, and turned his face to the wall. After a short time he felt his hand seized, the Professor was sitting by his bed clasping his friend's hand without saying a word. At last Fritz withdrew his hand with a hearty pressure and again turned to the wall.

He rose in the early dawn, gently approached the slumbering Professor, and then quietly left the room. The proprietor awaited him in the sitting-room; the carriage came; there was a short friendly parting, and Fritz drove away, leaving his friend alone among the crickets of the field and the ears of corn, whose heavy heads rose and fell like the waves of the sea under the morning breeze, the same this year as they have done thousands and thousands of years before.

The doctor looked back on the rock on which stood the old house, on the terraces beneath, with the churchyard and wooden church, and on the forest which surrounded the foot of the hill; and all the past and the present of this dangerous place rose distinctly before him. The ancient character of the Saxon times had altered little here; and he looked on the rock and the beautiful Ilse of Bielstein, as she would have been in the days of yore. Then the rock would be consecrated to a heathen god, even at that time there would have been a tower standing on it, and Ilse would have dwelt there, with her golden hair, in a white linen dress with a garment of other skin over it. Then she would have been priestess and prophetess to a wild Saxon race. Where the church stood would have been the sacrificial altar, from which the blood of prisoners of war would have trickled down into the valley.

Again, later, a Christian Saxon chief would have built his log house there, and again the same Ilse would have sat between the wooden pillars in the raised apartment of the women, using her spindle, or pouring black mead into the goblets of the men.

Again, a century later it would have been a brick house, with stone mullions to the windows, and a watch-tower erected on the rock, which had become a nest for predatory barons, and the Ilse of Bielstein again would have dwelt there, in a velvet hood which her father had robbed from a merchant on the king's highway; and when the house was assaulted by enemies, Ilse would have stood among the men on the wall and have drawn the large cross-bow, like a knight's squire.

Again, many hundred years later, she would have been sitting in the hunting castle of a prince, with her father, an old warrior of the Swedish time; then she would have become pious, and, like a city dame, have cooked jams and preserves, and gone down to the pastor to the conventicle; she would not have worn flowers, and would have sought to know what husband heaven destined for her by placing her finger at hazard on a passage in the Bible.

And now his friend had met this same Saxon child, tall and strong in body and soul, but still a child of the middle ages, with a placid expression in her beautiful countenance which only changed when the heart was excited by any sudden passion; a mind as if

half asleep, and of a nature so child-like and pliant that it was sometimes impossible to know whether she was wise or simple. In her character there still adhered to her something of all those Ilses of the two thousand years, a mixture of Sibyl, mead-dispenser, knight's daughter and pietist. She was of the old German type and the old German beauty, but that she should suddenly become the wife of a Professor, that appeared to the troubled Doctor too much against all the laws of quiet historical development.

(To be continued.)

## GOETHE AND THE DEVELOPMENT HYPOTHESIS.

BY PROFESSOR CALVIN THOMAS.

### II.

In the first part of this essay we discussed Goethe's general conception of Nature's *modus operandi* in the shaping of the earth. We have now to consider his speculations with regard to the development of living forms.

The studies that are now to be discussed began with the exigencies of horticulture at Weimar. In 1782 we find the busy poet-minister reading the botanical writings of Rousseau and "taking a taste" of Linnæus. In 1785 he is examining seeds under the microscope. About this time Linnæus begins to be his "daily study;" he exerts himself to master the Linnæan terminology, and a compendium of the great Swedish naturalist's system accompanies him on all his journeys. In the summer of 1785 he passes several weeks at Karlsbad, and there, in the society of helpful friends, the botanical studies make good progress. One day he comes upon an area covered with the *drosera* and is led to make further observations upon the "irritability" of plants. But, as would be supposed, these studies at Karlsbad were little more than the "analysis" of plants: The program consisted in taking a flower to pieces and ascertaining what name Linnæus had seen fit to give it. In this art Goethe complacently claims to have acquired some proficiency, although he was not enthusiastic over it, for the reason, as he very characteristically explains, that "dissecting and counting did not lie in his nature" (*Trennen und Zählen lag nicht in meiner Natur*).<sup>\*</sup> In this same connection he further observes, without explicitly making the opinion referred to his own: "We were often compelled to hear the objection that the whole science of botany, to which we were so devoted, was nothing but nomenclature; that it was a system built upon numbers, and imperfect at that, and as such could satisfy neither the understanding nor the imagination."

Upon his return to Weimar botany interests him more than ever. He carefully studies Linnæus' "Botanical Philosophy," and seeks instruction from specialists of his acquaintance. Presently, as we can see from his letters, a great idea, or what he takes to be such,

has begun to float vaguely before his mind. The earliest attempts at description are misty and poetical, but gradually the thought becomes clearer and gives him inexpressible pleasure. July 9, 1786, he writes to Frau von Stein, then the confidante of all his thoughts: "If I could but impart to another my vision and my delight, but it is impossible. And it is *no dream, no fancy*; it is a discernment of the essential form with which Nature continually, as it were, plays, and playing brings forth the manifold forms of life."<sup>\*</sup> In the autumn of 1786 he takes sudden flight to Italy and his "botanical whimsies" follow him over the Alps. Everywhere he goes the vegetation of Italy divides his attention with poetry and plastic art. Sept. 27, 1786, he writes from Padua: "It is delightful and instructive to wander about amid a strange vegetation. . . . Here in this novel variety the thought becomes more vivid that all plant forms might perhaps be developed from a single one."<sup>†</sup> Soon his mind is full of this *Urpflanze* or typical plant, and he commences to look for it, at first actually expecting to find it in Nature. This quest he soon gives up, however, and the typical plant becomes for him what it is for us, namely, an imaginary morphological norm. In 1787, while he is in Sicily, the idea suddenly flashes upon him that the various "organs" of a plant are essentially identical; that is, are variations of the same thing.<sup>‡</sup> This idea he follows up eagerly and develops in an essay: "The Metamorphosis of Plants," which was published in 1790—the poet's first actual contribution to scientific literature. This essay is small in compass and very modest in its tone. Its language aims to be scientific, but is, in fact, often figurative and poetical. Its substance is a development of the thesis that the organs of a plant, cotyledon, leaf, sepal, petal, stamen and pistil, are produced by nature through the progressive transformation of a single organ.

But now before we consider what these theories of the typical plant and of metamorphosis really meant to their propounder, and what their logical implications were, a few words may be devoted to the early history of his analogous speculations with regard to animal morphology.

It was in 1781 that Goethe began taking formal lessons in anatomy with Professor Loder of Jena. The

<sup>\*</sup> Werke XXXIII., p. 63. The essay from which I quote in the text, *Geschichte meines botanischen Studiums*, was written by Goethe in 1817, after his theories had begun to attract attention, for the purpose of showing that he had reached his conclusions, "not through any extraordinary mental gifts, not through a sudden inspiration, nor suddenly, nor unexpectedly, but through systematic effort."

<sup>\*</sup>Schöll-Fieitz: *Goethe's Briefe an Frau von Stein*, Vol. II., p. 334.

<sup>†</sup> Werke XXIV., p. 52.

<sup>‡</sup> Werke XXXIII., p. 71.

next year we find him collecting skeletons and observing their homologies. Prominent anatomists like Blumenbach, Sömmering and Camper taught that a fixed morphological distinction between man and brute was to be found in the fact that the former uniformly has the intermaxillary bone whereas the latter invariably lacks it. Goethe presently became convinced that any such distinction must be illusory. He found a perfect chain of homologies between the bony frame of man and that of the higher brutes and felt sure, to use his own significant language, that man and beast are "very closely akin" to each other. Could it be that Nature, whose method was that of gradual transition from one form to another without breaks and without barriers, had here broken this customary continuity and interposed an impassable barrier in the shape of an unfailing and absolute distinction? He felt that the integrity of his whole philosophy of nature depended upon his finding an intermaxillary bone in man. And so he went to work with his friend Loder, and, in the spring of 1784, found what he wanted. The specialists were slow in admitting his claim, but in the fullness of time it was seen that he was right.

It is not necessary to the present purpose to consider how far these ideas of Goethe had already been formulated by others or to trace in any detail the subsequent history of his morphological studies. There is no doubt that the ideas were original for him if not *with* him in the fullest sense of the word. Also what he subsequently wrote, though not inconsiderable in amount, is only a working out of the germinal conceptions already described. The question of interest here is: What did these conceptions involve? Or, to what extent were they in the line of modern evolution?

The answer to these questions turns largely upon the meaning which Goethe attached to certain words which occur constantly in his writings, namely, "Urpflanze," "Urthier," "Typus," "Urbild" and "Schema." The question is of course not so much what these words naturally denote as what they did actually connote for him. Some writers contend that Goethe's "type" was only a metaphysical abstraction involving no hypothesis of descent whatever. And undoubtedly there is some room for debate since the language employed is seldom perfectly clear. Take for example the following passage:

"This then we can have no hesitation in maintaining, that all the more perfect organisms, among them fishes, amphibians, birds, mammals and at the head of these last, man, are all formed after one archetype (nach einem Urbilde) that simply varies (hin und her weicht) more or less and is also continually developing and transforming itself through propagation (durch Fortpflanzung)."

\* Werke XXXIII., p. 261.

In this deliverance Haeckel\* sees all the essentials of modern evolution, while others, for example Kossmann,† contend that it means no more than if one were to say of half a dozen statues of Venus that they were all formed upon one type. This language certainly would not imply that they were all the bodily children of a common parent. In fact the very idea of descent from an archetype is an absurdity. But without this idea of actual bodily descent, Goethe's theory has no resemblance to the evolutionary doctrines of to-day. In fact it belongs as a theory to metaphysics or aesthetics rather than to physical science. Thus argue the writers who, with Kossmann, oppose the views of Haeckel.

With regard to the theory of metamorphosis a similar contention has been made. The well-known botanist Sachs seems to be of the opinion that Goethe's theory was a mere mental abstraction signifying, from a scientific point of view, simply nothing. Sachs would have us believe that Goethe, scrutinizing the organs of different flowering plants, and observing that their organs are not everywhere separate and distinct entities, but that here the cotyledon, elsewhere the stamen, and so on, looks more or less like a leaf, and that here and there are found organs that appear to represent a transitional state of development—simply subsumed the six different things under the name of leaf. If this be all there is of the matter, then obviously Goethe's performance was little more than a feat of nomenclature—an extension of the meaning of the word "leaf." It would be much as if one were to pick up half a dozen pebbles, and, observing in them certain resemblances in form and color, and discovering also that transitional pebbles could be found in the field which would resemble any one of the six more closely than this one would resemble any of the other five, should propound a theory of the metamorphosis of pebbles, and devise a name for the archetypal pebble from which all particular pebbles might be regarded as morphological variations.

Is this, then, what Goethe meant with his "Typus" and his "Urbild," and his metamorphosis of plants and animals? Very certainly it is not. The man who could suppose such a thing may know his botany and his zoology, but he does not know Goethe. The latter was no lover of abstractions that lead nowhere and signify nothing. Had the case been as just imagined he never would have told us that the happiest moments of his life were connected with his study of plant metamorphosis.‡ The fact seems to me entirely beyond question that Goethe's theory was a genuine hypothesis of descent. It was held somewhat vaguely and was very likely never thought out in all its detailed implications. He does not tell us how many *Urbilder* he finds it con-

\* *Natürliche Schöpfungsgeschichte*, 4th ed., p. 84 f.

‡ *Werke* XXXIII., p. 90.

venient to assume or how these originally came into existence; and it is to be remembered that his own studies were confined to a comparatively small range of phænogamous plants and vertebrate animals. Nor does he anywhere make a serious attempt to answer the difficult questions which his hypothesis naturally raises. He dilates often, to be sure, upon the variability of specific and generic distinctions, but he dilates also upon the apparent fixity of species and genera and nowhere does he express the opinion that the variability which he himself observed is sufficient to account for the origin of species and genera. In short, his mind overleaps and ignores the difficult details of the argument. Nevertheless, after much study of the many passages in his writings which refer to this subject, I cannot doubt that his hypothesis was really one of descent. When he says, "variations of a common type," or something similar, there is always latent in the background of his mind the subaudition, "children of a common parent."

From the first awakening of his scientific sense we find that the thought of the kinship of man with the lower animals is, with Goethe, a familiar thought. In November, 1784, he writes to Knebel, apropos of his still unprinted essay upon the intermaxillary bone, saying that he has refrained in the essay from intimating his convictions that the distinction between man and brute is to be found in no particular point; and he adds: "On the contrary man is most closely related to the brute. *Vielmehr ist der Mensch auf's nächste mit den Thieren verwandt.*"\* Among the high blessings for which Faust returns thanks to the Earth-Spirit is the sense of brotherhood with all living things:

"Du führst die Reihe der Lebendigen  
Vor mir vorbei und lehrt mich meine Brüder  
Im stillen Busch, in Luft und Wasser kennen."†

This passage was probably written in 1788. In a letter of Frau von Stein to Knebel, written somewhat earlier, occurs this sentence: "Herder's new work (the 'Ideen' is referred to) makes it probable that we were once plants and animals."‡ But this idea in such explicit form is not in Herder and it is certain that Frau von Stein did not originate it. Beyond a doubt she had it from Goethe.† Then how can we understand such language as this if we attempt to eliminate the idea of descent from Goethe's theorizing: "Nature can compass her purposes only in sequence. She makes no jumps. She could not, for example, produce a horse had not all the other animals preceded on which, as on a ladder, she ascends to the structure of the horse."§

But if there could be any doubt as to the range of Goethe's speculations with regard to the descent of

man, the doubt would be set at rest by the incident of Homunculus in the Second Part of *Faust*. Homunculus is a mind without a body and his desire is to "commence existence," i. e., to acquire a body and become a genuine *homo*. He accordingly takes expert advice as to how and where he can best do this and as a result finally dashes his glass house against the throne of Galatea and dissolves himself with the phosphorescent sea, there to come up in the lapse of æons through polyp, fish, reptile, mammal, to the estate of man. In the fable Galatea represents the Love-goddess and so the beginning of Homunculus' evolution is a grand act of homage to Love—and no wonder, since it is Love that must preside over each stage of his upward progress. The symbolism is so transparent that one can only smile at the perplexity of the older commentators of *Faust* in their attempts to expound the character of Homunculus. And be it said incidentally that the poetry of the Homunculus incident is, especially at the close of it, so superb that one can only feel sorry for the people who think that the Second Part of *Faust* "doesn't count."

But it will be said that this is poetry and it will be asked what evidence there is, in plain unequivocal prose, as to Goethe's attitude upon the fundamental articles of the modern evolutionist's faith. We have seen that he early accustomed his mind to operate with vast periods of time. With regard to the mutability of specific distinctions he writes thus:

"The changeableness of plant forms which I had long been observing awakened in me the idea that the forms about us were not originally fixed and determined, but that there had been given to them, along with a singular tenacity of generic and specific character, a fortunate mobility and adaptability (Biegsamkeit) by which they had been able to accommodate themselves to such manifold terrestrial conditions and to form and transform themselves accordingly."\*

Elsewhere he writes upon the same subject:

"If, now, we look for the occasion of this manifold adaptability (Bestimmbarkeit), this is to be said first of all: Animals are formed by circumstances for circumstances; hence their inner perfection and their adaptation to external conditions."†

Concerning teleological explanations, he uses this clear and decisive language:

"The question to be asked hereafter concerning such members as, for example, the tusks of the *sus babirussa*, will not be, What are they good for? but Whence came they? It will not be said that the bull has been given horns that he may gore with them, but the question will be raised, How he came to have horns for goring."‡

Even the struggle for existence and its results in cer-

tain specific cases\* had been observed by him, although there is no evidence that he had anything like an adequate conception of the magnitude and importance of the subject. But to sum up without further multiplying quotations: The kinship of living things, the descent of man from lower orders of life, mutability of specific distinctions, progressive adaptation of organisms to external conditions, struggle for existence—all these ideas Goethe certainly had. What he did not have was the doctrine of natural selection and the vast array of observed facts which have since taken this entire subject out of the hands of poetic and philosophic generalizers and given it in charge of a new generation of scientific investigators.

Would the great German poet feel at home in this new generation? Would he breathe with pleasure and exhilaration the scientific atmosphere of our day? Du Bois-Reymond thinks not, for the reason that he lacked interest in mechanical causes; the great sciences with which he concerned himself are now quite largely occupied with questions of physics. With this opinion I incline, upon the whole, to concur. Goethe would undoubtedly be pleased to find in recent research the confirmation of many ideas that had become dear to him. But, on the other hand, he had a rooted dislike of laboratory methods, and the laboratory is triumphant. That strange superstition of his about "dissecting and counting" would make him poor company for a modern biologist. Or would he, if alive, succumb to the genius of the age and recant his famous dictum:

"Geheimnissvoll am lichten Tag  
Lässt sich Natur des Schleiers nicht berauben,  
Und was sie deinem Geist nicht offenbaren mag  
Das zwingst du ihr nicht ab mit Hebeln und mit Schrauben."

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.†

Part III.

#### RACE INFLUENCES—CONTINUED.

Biographical studies have established the fact that the persistence of animal race-habits is proportioned to the length of their original influence. In a transient way even the habits of a limited number of generations are apt to become hereditary. Young pointer-dogs often volunteer the purely artificial trick enforced (for the hunter's convenience) upon a few generations of their ancestors, but without constant practice the progeny of the best hunting-dog will soon cease to "point" game. Yet, the habits acquired during the countless ages when the wild dog disputed the hunting-grounds of the wolf and the jackal, have persistently withstood the influence of domestication. The pampered spaniel, not less than the leanest hound, still provides for hard

times by burying superfluous bones. Breeds of dogs which for centuries have earned their bread by treadmill work still hunt in their dreams. The half-wild bush-dog of the Mexican Sierras joins in the howling serenades of the prairie-wolf and, like the fox, rears his whelps in deep burrows. Neglected domestic cattle revert to the original type of their species: ancestral habits will re-assert themselves at the first favorable opportunity.

The same rule holds good of inveterate race-habits of the human species. Of all the nations of Europe the Spaniards have, for the longest period, been subjected to the vicissitudes of a defensive war against foreign invaders. A thousand years before the beginning of our chronological era, Phœnician fleets already harassed the Spanish coasts from Malaga to the mouth of the Ebro. Eight centuries after the legions of Rome pushed their westward conquests to the shores of the Atlantic, though not without desperate resistance, as attested by the defeat of three successive consular armies and the unparalleled episode of Numantia, where the entire population of a large city committed suicide to avoid the alternative of surrender. After the Romans came the Vandals and Visigoths and finally the Moors, who for nearly seven centuries maintained a continual border-war against the champions of the cross. Long-continued habit is apt to become a second nature, and in the course of ages the natives of the Iberian peninsula have acquired an instinct which a modern traveler aptly describes as the *Guerilla passion*—a chronic penchant for conspiracy and insurrection. The Castilian autocrats succeeded for awhile in bridling that passion, but after the conquest of America it broke out with redoubled force, and when the colonists of the transatlantic provinces had exhausted all other pretexts of rebellion, they proceeded to quarrel among themselves and still continue to revolt against their self-elected liberal governments. Indifference to the blessings of industrial peace is no adequate explanation of that Spanish-American mutiny mania. "Are you not getting tired of those everlasting scimmages?" I once asked a Spanish-Mexican agitator. "Que mas quiere?" he asked with a look of surprise—"what better can you wish?" "es la verisima vida de un hombre"—"it's the true life-element of a man!"

Germany, too, has borne the brunt of foreign invasions, but her invaders were mostly city-conquerors. The Rhenish colonies of the Cæsars were mere fortified camps. Charlemagne, after the murderous battles of the Saxon campaign, had to content himself with founding a few dozen *Bisthümer* (bishoprics) garrisoned with soldiers and priests, to tame the pride of the Saxon princes. But the forest dwellers of the inland-districts still maintained their independence; and four hundred years after, when the prelates of the church had

\*Cf. *Werke*, XXXIII., p. 121.

†Copyrighted.

acquired sovereign power, the *Freiherren* ("free lords") of a thousand castles still defied control, and with their sport-loving retainers enjoyed as much secular freedom as Xenophon in his Arcadian hunting-lodge. They hunted and caroused; the lays of their minstrels were psalms of Naturalism, and even the ditties of the German rustics (like the ballads of the Robin Hood era) breathed defiance to clerical tyranny.\*

From despotism and the worry of city-life the countrymen of Arminius thus learned to take refuge in a communion with nature; and *Natur-liebe*—Nature-worship and the love of outdoor life, has remained a chief character-trait of the German nation. While the shores of the Mediterranean and the rivers of France and Spain are bordered by ranges of desolate sandhills, the mountains of Germany are still crowned with the glory of their primeval forests, one-third in the German Empire, one-tenth in France and one-fifteenth in Spain being the present proportion of woodlands to treeless areas. The aristocracy of Italy and Spain spend their revenues in city pleasures, while German and British nobles prefer the hunting-grounds of their ancestral estates. The German colonist, even in the prairies of Kansas, manages to surround his homestead with a grove of shade-trees. The typical Spanish-American *hacienda*, even in the heart of the tropical virgin-woods, is a sun-blistered stone-pile, surrounded by treeless fields. The Spanish-American colonist, with all his race-instincts of poetry and beauty-worship, has no eyes for the grandeur of his native Sierras, nor for the charm of the tropical vegetation and the beauty of tropical birds and butterflies, while the German schoolboy knows the favorite food-plants of every caterpillar and spends his vacations in woodland-rambles and mountain excursions. The very nursery-tales of southern and northern Europe express that curious contrast. The Spanish *recountador* edifies his infant audience with saintly biographies and miracle legends. The German fairy-tales deal in zoological allegories and hunting adventures, and their occasional supernaturalism is used to conceal an unclerical, often, indeed, decidedly anti-clerical tendency. Thus, the sleeping Barbarossa, the hero of the most popular mediæval legend, has been unmasked as an *alias* of the red-bearded Wodan, the old pagan forest-god, who has found refuge in a palace of the mountain-spirits and bides the time when the black ravens of Golgotha shall cease to darken the sky of his hunting-grounds.

The champions of the anti-Semitic crusade are compelled to admit the marvelous fact that in proportion to their number the despised Hebrew exiles can produce a grander intellectual herald-roll than any other nation of ancient or modern times, the Greeks under Pericles per-

haps alone excepted. That marvel, however, is somewhat modified by the fact that persecution, under certain circumstances, tends to stimulate, rather than repress, intellectual activity. For nearly fourteen hundred years fanatical intolerance debarred the Hebrew refugees from nearly all employments but that of commerce, literature and speculative philosophy. They could not own land, they could not own mines, they could not manufacture, they could not serve the state in the humblest capacity, they could not even plow: they had to huddle together in walled cities for fear of being slain by the priest-ridden country population. They had to "live by their wits," and those wits accordingly were developed far beyond the average intellectual standard of each century. No Christian of the middle ages could have written the *Ethics* of Spinoza. No Christian or Moorish Spaniard could have composed the epigrams of Rabbi Gabirol; and the burgers of Dusseldorf, who a month ago voted against the erection of the Heine monument, proved that the intellect of their exiled fellow-citizen ranked more than a century ahead of his age. Even now, when the gospel of liberty and equality has broken the barriers of intolerance, our Hebrew fellow-citizens still fight in the front rank of intellectual progress. Their names stand high in every department of progressive science, they join the vanguard of every social and ethical reform; but at the same time they also continue to evince a remarkable indifference to the culture of those physical powers which were stunted by the bigotry of the middle ages. They practice gymnastics in quest of health rather than of pleasure; they shun the army, they abhor and avoid the prize-ring. Like the sea-faring Greeks, they stick to the pursuits that helped them to weather long centuries of persecution.

The Anglo-Saxon race, on the other hand, has attained its supremacy literally by victories of the strong hand, by martial prowess and physical energy. From the time of Odin worship to the invasion of the Normans, the countrymen of Hengist and Horsa never met a superior foe. From the warlike tribes of northern Germany they wrested the richest district of the Danish border, as they afterwards wrested Great Britain from the numerically superior tribes of the Celtic aborigines. Their stubborn resistance prevailed against the aggressive vigor of the Norman conquerors; by their superiority of physical prowess they ousted their French rivals from Canada and Hindostan, and their Holland rivals from southern Africa. In peace and war, in the perils of the sea, as in the struggle and the wilderness of an untamed continent, they learned to rely on expedients of physical strength, and the worship of physical fortitude thus became a hereditary character-trait of their nation. The anti-physical polemics of their creed have proved utterly unavailing against that tendency. In "merry old England" hard-working rustics would walk scores

\*Witness that memorable old *Jäger-lied*:

"Nun kehr ich öimmer wieder ins graue Dorf hinab,  
Im Walde will ich leben, im Wald grabt mir mein Grab,  
Wo mir dess Pflüffen Kühe nicht drauf zur Weide gehn,  
Das Wild roll drueber springen; Kein Kreuz im Wege stehn."

of miles to witness the decision of a wrestling-match or an inter-county archery contest, and in the sabbatarian metropolis of Quakerdom the same enthusiasm still kindles about every prominent ball-game or foot-race. The same newspapers that swell their pages by copying the homilies of a Brooklyn revivalist, swell their subscription list by detailing the exploits of a Boston prize-fighter.

#### THE FUNDAMENTAL PROPERTIES OF MATTER.

BY J. G. VOGT.

II.

*Translated from the German by F. W. Morton.*

Let us imagine a center of condensation in the state of greatest laxity or attenuation, and, therefore, subject to the maximum value of the negative fluctuation. Were it let entirely free, or could it wholly overcome the opposition of its environment, it would immediately have a tendency to seek the maximum value of condensation. Since in a continuous substance each center of condensation has to be reckoned with its environment, i. e. has to overcome its opposition (for *each* center of condensation seeks of its own accord to attain to the maximum value of the positive fluctuation), this maximum value cannot be reached at one time, but only by gradual steps. The volume of the center of condensation will *gradually* become smaller under thousands of these graduations. We have, therefore, to conceive of a center of condensation in unbroken, powerful *vibrations of contraction*, with the help of which it seeks to destroy the opposition of its environment. Further, the more powerful or energetic these vibrations are, the higher is the negative fluctuation; and the weaker they become, the more the center of condensation approaches the maximum value of the positive fluctuation. Thus it accomplishes its purpose and sets free its own action. According to the fineness of the distinction to be drawn, we can interpose between the two maximum values of the negative and positive fluctuations an immeasurable scale of volumes, i. e. in respect to density, which the center of condensation has to traverse by virtue of its contraction vibrations. Here we come back to the foundation of elementary feeling.

It is now perfectly clear that when we conceive of these vibrations of contraction in the sense just explained as a manifestation of mechanical power, we have fundamentally a much safer and more definite idea of the elementary condition of matter than that of the former conception of matter, and above all of the kinetic. It must not here be overlooked that in such a conception of matter or substance we have to deal only with the mechanical *form* of action. The essence of matter or the essence of the indwelling power or energy is a thing about which only an ingenuous realist will trouble himself. The first and only point of union for all philosophies or sciences lies in the *form* of action and not in the

nature or essence of the effective power and its material embodiment. All that the kinetic philosopher can say is that his atom or point moves in transverse vibrations. The atom itself is an accepted fact. These circumstances we must always keep clearly in mind when we do not wish radically to go astray.

The concentric vibrations of the centers of condensation show us with strict exactness the *scope* and *direction* of the elementary motions; while the kinetic conception of matter clearly proves, even in its fundamental basis, the impossibility of such precise statements. According to the view of the kinetic philosopher, the hard atoms must vibrate *transversally*, in all directions; and in these vibrations must strike against one another. In this fundamental conception law evidently does not prevail, but *chance* itself, or, in other words, *chaos*. When will such a vibrating atom strike another? How can the intermediate spaces be computed or how can a phenomenon subject to law, and influenced by time and space, be developed from such uncertainties? The absurdity of such a fundamental conception will clearly appear, if, in place of these atoms, we suppose the celestial bodies to describe such transverse paths of vibration instead of elliptical courses. Who would be able to demonstrate any one regular occurrence—a world-process—without first accurately determining these transverse paths of vibration in respect to extension, direction, and the possibility of their collision with other courses? Therefore, not even in respect to the physical phenomena, the mechanical occurrences of the world, is this kinetic conception of matter applicable, to that for which it was simply and solely created. How can any one physical explanation, founded upon it, find credence when the conception itself in its fundamental basis is lame and untenable?

On the other hand, the contracting vibrations of a center of condensation correspond to the above-mentioned accomplishment of a strong and undeviating regularity; just as do the transverse motions of the kinetic philosopher's atom. Indeed, we may say that they suffice to explain the monotony which I have censured above in the purposeless, vibrating atoms of kinetics. Our conception of matter, therefore, is entirely sufficient for an explanation of the physical, monotonously regular phenomena of the inorganic world, and may be applied, treated and elaborated with as much mathematical exactitude as the kinetic conception of matter.

But it affords in this respect infinitely more than the kinetic conception of matter; it offers us an invaluable means for establishing the principle of feeling, for explaining the vast realm of organic phenomena which even to-day neither the kinetic nor any other conception has in the slightest degree made possible. With the same right with which the kinetic philosopher postulates a purely mechanical, i. e. a blindly acting and pur-

poseless force, we may assume the world-substance to be a *feeling* substance and represent the motions or vibrations of contraction fundamentally as expressions or phenomena of feeling. Moreover, in its rude outlines, the idea of such contractile centers of condensation as a *feeling* substance offers us no difficulty. But let us apply ourselves directly to the problem.

The world-process, which goes on before our eyes, bears in itself one unmistakable characteristic. Not alone the investigation of our own narrow place of abode, but even the physics of the stars, decipher from the bright orbs of the firmament the mysterious purpose which the whole world-process follows; and this, mechanically expressed, can be sought in nothing else than in *condensation*. The Ionic philosophers have already given expression to this thought. The condensation of the spheres, as the end of all physical processes, changes and formations, stands so unassailably before our scientific mind, that no further foundation for this is needed. In these cosmical changes is mirrored the fundamental tendency of the elementary centers of condensation.

Now, how near lies the thought of attributing to these centers of condensation, as *feeling* entities, the effort or tendency to attain in the positive maximum value of condensation an *absolute condition of rest*. This maximum value incorporates for us the absolute *rest*, *Nirvana*, the *sinking into peaceful, unconscious nothingness*. In opposition to this each *negative* fluctuation drives the center of condensation from this condition of repose and leads it to activity, to conscious feeling, to pleasure, perhaps to pain, as elementary qualities of feeling.

At a single blow, the contracting motions of a condensation center receive, in this way, a sense, which seems to me *purposeful*; they are the expression of an effort which accomplishes a purpose, a real world-purpose. The whole mechanism of the world rests upon this, that a part of the world-substance can attain to this end only at the expense of another. While a part of the matter strives for the condition of repose, another part, according to the views expressed above, falls to feeling activity. Life and death go always hand in hand.

If we revert now to the above-mentioned scale of volumes, or vibrations of contraction, we can very easily bring this, as a phenomenon of motion founded purely upon mechanics, into connection with a corresponding *scale of feeling*; and that, too, so that each vibration of contraction of a different value corresponds also to a different mode of feeling, and brings to expression each shade in the life of feeling. To every mechanical motion of contraction corresponds a moment of feeling; to speak in the sense of Spinoza, to each *outer* mechanical moment of activity corresponds an *inner* activity of feeling, and as every mechanical vibration of contraction is of different value different qualities of feeling correspond to these values.

We have now scarcely any standard or point of reference by which to rank together in an unbroken scale the immeasurable series of feelings as they manifest themselves in our ego. We can only hypothetically assume, that, e. g. the modes of feeling of the five-sense categories follow one another; that they perhaps possess the approximate means of a scale of feeling; that is, that they would correspond approximately to the medium degree of density of the centers of condensation. We are possibly right in this assumption, since the modes of feeling of the five-sense categories are, in comparison with the feelings of pleasure and pain, of more *indifferent* nature. The vast series of pleasurable feelings would perhaps fall in the positive direction; while the feelings of discomfort and pain would belong to the negative end of the scale. For, the higher the negative fluctuation which the center of condensation suffers, the more will it be threatened in its duration, the more will it be removed from its real end and purpose, the more correct shall we be in supposing here a feeling of pain, and with it the energetic effort to escape this painful condition by means of powerful vibrations of contraction. I suggest, as I said, this comparison only as an hypothesis.

The chief thing, is that we are to ascribe to each separate vibration of contraction, and therefore to each change of volume in a center of condensation, a different quality of feeling, just as in physics each definite color or line in the spectrum corresponds to some one wave of ether. Thus, just as in the scale of color the different modes of feeling merge into one another by thousands of gradual transitions, so without doubt we are to class together all other sensations, feelings and effects in the fundamental scale of the whole.

Now, it must at once be apparent that these fundamental expressions of feeling only have sense when they are joined with consciousness, i. e. occur simply as conscious feelings. For what in general would unconscious feelings signify? We can at most distinguish different degrees of brightness or intensity of the conscious feeling. If, for instance, we put our head between our legs, and a state of tension be produced in the seat of consciousness by the increased flow of blood to the brain, we see nature in more beautiful colors. The blue of heaven is more intense, the green of the meadows stronger. On the other hand, in our intellectual images (in distinction from the immediate images of perception), we see paler colors and vaguer forms. We can here evidently speak only of different degrees of brightness and intensity of the conscious feeling. These degrees of brightness can be subjected to any fluctuations whatever, fluctuations however which move only within definite bounds and at most, apparently, within very narrow ones.

An unconscious, and therefore a feelingless, condition

will first be reached when the centers of condensation draw near to the maximum value of the positive fluctuation and finally reach it. This maximum value alone, or the approach to it, signifies unconsciousness, absolute rest, sinking into Nirvana, nothingness; removal from this means conscious feeling, life, activity, pleasure and pain.

In this, however, one thing must be observed, viz., that in this fundamental scale of feeling only the simple elementary qualities of feeling, as we find them in our living senses, perceptions and feelings, can have place. It would be idle to seek to enroll here, already formed, any form of activity like an organized principle, or any intellectual function like the idea of space, etc. There are products of development which are first distinguished in a far advanced world-process, and which must be conceived of and pronounced as characteristics of the great realm of organic phenomena.

#### MATTER AND ITS QUALITIES.

The essay by J. G. Vogt on "The Fundamental Properties of Matter" causes me to express the following definition of my understanding of the monistic position:

The relation of the chicken to the egg is this, that the egg contains all the substance and forms which will through interaction evolve the live chicken as it breaks through the shell. Only warmth has to come to it from the outside and perhaps some oxygen through the pores of the shell.

In a similar relation man of to-day stands to our earth with the influence of the sun and all cosmo-surrundings, as they were at the time when organic life apparently commenced on earth—certainly in the most simple forms. Out of the joint action of all there was then, which has since been acting together, the present man has resulted, and not from a certain atom or a certain portion of matter. The whole earth with all its surrundings stands in place of the egg. The chicken results from the egg in three weeks; man has resulted from the primeval earth in millions of years.

EDWARD C. HEGELER.

#### THE CHICKEN AND THE EGG.

The comparison of the primeval earth to an egg is most obvious, and serves exquisitely as a monistic explanation of evolution at large. Indeed, the theory of evolution was first brought to light by observing the chicken develop from the egg. The egg afforded a clue to comparative embryology, and comparative embryology is the basis of the evolution theory.

But we must bear in mind that an allegory is always imperfect; as the Romans said, *omne simile claudicat*—it limps; and if it did not, if it were applicable in every respect, it would not be a simile; it would be an identity. Similes are illustrative and instructive, but we must observe wherein the simile is not adequate.

The difference between an egg and the primitive earth (or perhaps the nebula from which the sun and his planets developed), is this: A chicken existed before the egg, and the egg develops a chicken because it contains the memories of many millions of chicken ancestors. The egg would not exist but for the hen. The hen transmits certain forms of motion which are the sum total of all the experiences of herself and her ancestors to a part of her body, the *ovule*. The ovule, when fertilized, grows and is excreted as an egg.

The famous question, "Which was first, the hen or the egg?" must be answered: "Neither." Living protoplasm was first, which under certain conditions produced the egg-bearing hen.

A nebula contains all the conditions for producing a planetary system, and on the surface of its planets worlds like ours. Matter, it must be assumed, possesses the qualities of motion and elementary feeling; it can merely through combination in a long process of evolution develop the higher forms of existence, organic life, consciousness and rational will. This evolution is inherent in matter, and is no process of evolving transmitted memories which contain a special form of life and only that form. There is no world-hen who imparted her experiences and intelligence to the produce of her creation. Such a conception of evolution, which places its outcome and its ideal aim at the beginning, leads to dualism. It assumes a transcendent and supernatural creator, and is forgetful of the fact that it would have been an unwise, not to say reckless and immoral, act for a being in the grand state of all-perfection to produce a world which on the thorny path of immeasurable pain and constant self-sacrifice had, with trouble, to climb up to higher stages of existence.

The only solution which is offered as a monistic conception of the world is to assume that matter is not dead, but active, viz.: it possesses motion and elementary feeling, from which the higher forms of life are produced. Evolution is development of form. The progress of evolution produces forms which never before existed, and in the struggle for existence some forms perish perhaps forever, while others, adapted to their surrundings and improved so as to acquire more power of resistance to destructive influences, survive.

P. C.

#### VICTOR HUGO'S CREED.

My soul drinks in its future life,  
Like some green forest thrice cut down,  
Whose shoots defy the axman's strife,  
And skyward spread a greener crown.

While sunshine gilds my aged head  
And bounteous earth supplies my food,  
The lamps of God their soft light shed  
And distant worlds are understood.

Say not my soul is but a clod,  
Resultant of my body's powers;  
She plumes her wings to fly to God,  
And will not rest outside His bowers.

The winter's snows are on my brow,  
But summer's suns more brightly glow,  
And violets, lilacs, roses now  
Seem sweeter than long years ago.

As I approach my earthly end,  
Much plainer can I hear afar  
Immortal symphonies which blend  
To welcome me from star to star.

Though marvelous, it still is plain;  
A fairy tale, yet history;  
Losing earth, a heaven we gain—  
With death win immortality.

For fifty years my willing pen  
In history, drama and romance,  
With satires, sonnets or with men,  
Has flown or danced its busy dance.

All themes I tried, and yet I know  
Ten thousand times as much unsaid  
Remains in me! It must be so,  
Though ages should not find the dead.

When unto dust we turn once more,  
We can say, "one day's work's done,"  
We may say, "our work is o'er;"  
For life will scarcely have begun.

The tomb is not an endless night;  
It is a thoroughfare—a way  
That closes in a soft twilight  
And opens in eternal day.

Moved by the love of God, I find  
That I must work, as did Voltaire,  
Who loved the world and all mankind;  
But God is Love! Let none despair!

Our work on earth is just begun;  
Our monuments will later rise,  
To bathe their summits in the sun,  
And shine in God's eternal skies!

—Translated by Row.

## CORRESPONDENCE.

### GOETHE'S VIEW OF IMMANENCE.

To the Editor: PORT REED, FLA., March 15th, 1888.

In the controversy about the immanence or transcendentality of force in matter, does not that wonderfully plastic enunciation of Goethe's, of which (I fear inadequately) I attempt the following translation, come in as an analogy:—

The God whose being in mine showers,  
Can rouse my soul to active will;  
The God whose throne's beyond my powers,  
For purpose, will and deed is nil.

If the form of the translation is insufficient, it interprets at least, I think, what is essentially the thought of the great German poet.

Yours truly,

DR. LINDORME.

[Dr. Lindorme's translation is very expressive. Bayard Taylor's version does not seem to be quite so clear and strong, although he translates more literally.]

"The God that in my breast is owned,  
Can deeply stir the inner sources;  
The God above my powers enthroned,  
He cannot change external forces."

The translation by Charles T. Brooks is not correct in line 3:

"The God who dwells within my soul  
Can heave its depths at any hour,  
Who holds o'er all my faculties control,  
Has o'er the outer world no power."

The original words are taken from Faust I, 4:

*Der Gott, der mir im Busen wohnt,  
Kann tief mein Innerstes erregen;  
Der über allen meinen Kräften thronet,  
Er kann nach aussen nichts bewegen.*

The passage is of great importance and it will repay the trouble of reading it over with its context. It contains the chief reason for Faust's complaint and pessimism, which must be looked for in his dualistic conception of God and life.

Faust says that he will presumably feel the pain of life in every attire:

*In jedem Kleide werd ich wohl die Pein  
Des irdgen Erdenlebens fühlen.  
[In every dress I well may feel the sore  
Of this low earth-life's melancholy.]*

—Translated by Brooks.

The world can offer nothing:

*Was kann die Welt mir wohl gewähren?*

[What from the world have I to gain?—Brooks.

Certainly a God who lives in his bosom can stir his will and rouse his enthusiasm; but the supernatural God is helpless. Faust feels himself, on the one hand, too old for mere play, too earnest and enlightened to be a puppet in God's marionette-theatre:

*Zu alt bin ich um nur zu spielen.*

[I am too old merely to play.]

And on the other hand he feels too young to live without aspiration:

*Zu jung um ohne Wunsch zu sein.*

[Too young to wish for nothing more.]—Brooks.

He yearns for freedom, the chance of independent work and creative activity. Yet, as a marionette, he must renounce all hope:

*Entbehren sollst du, sollst entbehren,  
Das ist der ewige Gesang,  
Der jedem an die Ohren klingt.*

[Renounce, renounce, Renunciation—  
Such is the everlasting song,  
That in the ears of all men rings.]—Brooks.

Faust laments that "every day kills

Every presentiment of zest  
With wayward scepticism, chases  
The fair creation from his [my] breast,  
With all life's thousand cold grimaces.—Brooks.

*[Der selbst die Ahnung jeder Lust  
Mit eigenemgen Kräfte mindert,  
Die Schöpfung meiner regen Brust  
Mit tausend Lebensfräzen hindert.]*

\*The translators introduce here words which lead astray. Bayard Taylor translates "I am too old to play with passion." Charles T. Brooks' version is better: "I am too old to live for folly."

So by the burden of my days oppressed,  
 Death is desired and life a thing unblest,—*Bayard Taylor.*  
*[Und so ist mir das Dasein eine Last,  
 Der Tod erwünscht, das Leben mir verhaßt.]*

Magic cannot cure Faust's longing, and his yearning for the intercourse with the world of spirits affords no satisfaction. His life is a course of errors, until he finds at the end of his career, peace, contentment and salvation in work in energetic activity. The field of his labor is not some supernatural dream-land, but this world of ours, and he devotes his efforts to the benefit of human kind:

To many millions let me furnish soil,  
 Though not secure, yet free to active toil;  
 Green, fertile fields, where men and herds go forth  
 At once, with comfort on the newest earth,  
 And swiftly settled on the hill's firm base,  
 Created by the bold, industrious race.  
 A land like Paradise here, round about:  
 Up to the brink the tide may run without,  
 And though it gnaw to burst with force the limit,  
 By common impulse all unite to hem it.  
 Yes, to this thought I hold with firm persistency;  
 The last result of wisdom stamps it true;  
*He only earns his freedom and existence  
 Who daily conquers them anew.*  
 Thus here by dangers girt, shall glide away  
 Of childhood, manhood, age, the vigorous day;  
 And such a throng I fain would see  
 Stand on free soil among a people free!—*Bayard Taylor.*

Bayard Taylor says in his note to the quoted passage: "If Faust has only given 'free activity' and not absolute 'security' to the millions who shall come, he sees, at last, the great value of their very insecurity, as an agent which shall keep alive the virtues of vigilance, association and the unselfish labor of each for the common good."

Thus Faust finds atonement in Monism; he finds satisfaction and the peace of his soul not in the rest of leisurely security but in a constant struggle for freedom and existence. He is no longer a tool in the hands of some one beyond, since his freedom is the result of his own action. It is a boon of the God who lives in his bosom.

The contemplation of his plans and their realization thrills Faust with joy. It is a moment of rapture filled with the bliss of eternity and in the hour of his death he feels the spell of immortality—of an immanent immortality.

Then dared I hail the moment fleeing:  
 "Ah, still delay—thou art so fair!"  
*The traces cannot of mine earthly being,  
 In aons perish—they are there!*  
 In proud fore-seeing of such lofty bliss,  
 I now enjoy the highest moment—this!—*Bayard Taylor.*

EDITOR.]

#### LIBERALISM AND THE OPEN COURT.

MR. HEGELER: March 19, 1888.  
*Dear Sir*—I cannot join "A Monist," in No. 29, in his desire that everything save technical Monism should be excluded from THE OPEN COURT. I trust your journal will take a wider career than that—will fill the place, now unoccupied, of leader of the liberal press of this country. I am glad it has written Monism on its banner, but cannot it find room to write Liberalism beside it? Few understand how prevalent liberalism is among the educated people of the United States, and how much in need it stands of an organ. Nearly all the able writers are liberals, and their contributions would insure the success of a journal pledged to that cause. THE OPEN COURT has already offered on its title page, among others, the names of Col. Higginson, Mr. Parton and John Burroughs; of Felix Oswald, W. L. Garrison and Thos. Davidson. These are names which command the instant attention of every intelligent man in the country—of every man whose

attention is worth commanding. One could easily name twenty-five others whose signatures are of equal value to any new journal seeking to gain an intelligent public hearing. They are all liberals. It would be hard, indeed, to find a writer of national reputation, of commanding position, who is not a liberal. But while these leaders of national thought contribute to the literature of fiction and criticism and art and science, there is no avenue, no special literary organ, by which they can reach the public, and by which the public can hear them, on questions of ethics and religion and philosophy. New journals usually have to work hard and long to gain the public ear, but here is an opportunity ready provided.

Turning to Monism, all philosophical readers of THE OPEN COURT must await with deep interest the fuller exposition of this new system. "A Monist" seems to think that a more definite statement of its principles, such as other philosophies and theologies offer, would be acceptable to readers, and this is my impression also. I presume I am like the other special workers in philosophy and psychology in this country—it would be a pleasure to respond to THE OPEN COURT's friendly invitation to comment on its system of belief, but this is impossible until the system is more definitely outlined. It would be an aid, for example, to know what the All is; whether it is simply everything that exists and may exist, or a distinct entity with attributes, and what the attributes are. Spinoza had an All which he named Universal Substance; would not a comparison of the two be an excellent method of elucidation? Faithfully yours, A LIBERAL.

#### "OPEN COURT" OR "MONIST."

To the Editor:

In answer to "A Monist," in No. 29 of THE OPEN COURT, allow me to say that I prefer the title OPEN COURT, and I think it the most appropriate for a journal devoting its work to conciliating religion with science. The journal can always be monistic, but it must also be an OPEN COURT, where all sides can have a hearing and a fair trial before judgment is pronounced. The articles mentioned by "A Monist" were certainly very interesting and intended to elevate the moral and social standing of humanity and this should be the first object of every human being. I am a believer in the monistic theory of the universe, but Monism as well as all other isms will be a failure unless intended to bring about Monism between rich and poor, that is, the recognition of equality and dependence on one another. This cannot be done by any state law or force, and the social problem will not be solved until ethics and morality are placed above all isms and religion, when every man will say with Thomas Paine: This world is my Country, to do good is my Religion.

Yours, etc., G. H. SCHEEL.

#### BOOK REVIEWS.

IDYLS AND LYRICS OF THE OHIO VALLEY. By John James Piatt. Boston: Houghton, Mifflin & Co.

These poems are what their title partially explains, descriptive of Western pioneer life and its natural scenery, if it is any longer permissible to locate the field of the Western pioneer so far east as Ohio. But all things are relative, even those limits to a cultured civilization laid down in geographical lines, and to a certain order of Eastern imagination we do not doubt the "lucky" state of Ohio is quite far enough removed for even its strongest stretching to include. Most of Mr. Piatt's poems deal with themes drawn from nature and the homely experiences of farm and country life. He is essentially an out-doors poet, and there is here a singular, some would say refreshing, absence of the spirit of modern introspection, doubt and distrust of life and the

universe's worth. Mr. Patti's verse is everywhere characterized by its objectivity—a rare virtue among any class of writers in this day—and that will bear fruit among his readers, doubtless, in teaching them to follow his example and look outside themselves for life's main joy and instruction.

C. P. W.

**THE SECOND SON.** By *M. O. W. Oliphant* and *T. B. Aldrich*. Boston: Houghton, Mifflin & Co.

Readers of this story in the serial form, as it appeared in *The Atlantic Monthly*, were struck by the singular character of its double authorship. The combination of the serene, intellectual traits, united to a high order of English respectability and commonplaceness, represented in Mrs. Oliphant, with a genius as tricky and unique and wholly modern and American as Aldrich's was as strange as it was unexpected. Yet the amalgamation of the two authors has been more successfully accomplished than was expected, and we should not like to accept the task of separating and naming the part of either in the work before us. The story has a decidedly English atmosphere and flavor, but we suspect some of the finer strokes in the delineation of Lily's character are by another's hands than her compatriot's. Anyway the story affords pleasant reading and is an excellent study of those mixed and warring social conditions that are found in the older civilizations across seas.

C. P. W.

**THE ENGLISH IN THE WEST INDIES.** By *James Anthony Froude*. New York: Charles Scribner's Sons.

Mr. Froude is a voluminous writer whose reputation rests chiefly on his "History of England," his various essays entitled "Short Studies on Great Subjects," his extravagant biography of Cæsar, and the remarkable course he pursued as Carlyle's literary executor. Mr. Froude has scarcely recovered from the numerous attacks that the critics made on him on account of the Carlyle papers, when, by the publication of this latest volume, he again exposes himself. The great redeeming feature of our author's work is his style. But it is like beauty without character. Mr. Froude contradicts himself; his statements are full of inaccuracies, and, lastly, his method of making his point, to say the least, calls for disapprobation.

The object of the whole book is to make an attack on Gladstone and to show that home-rule ought not to be granted to Ireland.

E. G. B.

The colored print of Gladstone in the March number of the *Art Amateur* is almost inevitably somewhat raw in color, and yet it is very effective at a proper distance by its admirable grouping and strong relief. The wood cuts scattered through the number are bold and free, especially the Breton Ferry by Walter Satterlee. "Animal Locomotion" gives an account of the work done by instantaneous photography in giving us the exact positions of the limbs in violent motion. It is pleasant to find that in many cases the unrelenting photograph confirms the drawing of those artists who have been celebrated for their skill in painting animals. They will certainly afford valuable materials for artists' study even if they need not be literally copied. The number is mainly devoted to designs for household furniture and other branches of decorative art. An interesting paragraph gives an account of the process of photographing by "the flash light." If this is brought to perfection it will certainly produce many beautiful and wonderful results and light up the dark places most effectively. It has been found especially useful in *post mortem* photography, which is often of great importance. An amusing novelty, called "The Transition Portrait," is also mentioned, by which two or more phases of the human countenance are presented in one photograph. Other practical improvements in the photograph are also recorded.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

## CHAPTER X.

## THE WOOING.

A few hours after his friend had left the estate, the Professor entered the study of the proprietor, who exclaimed, looking up from his work: "The gypsies have disappeared, and with them your friend. We are all sorry that the Doctor could not remain longer."

"With you lies the decision whether I shall linger here," rejoined the Professor, with such deep earnestness that the host arose, and looked inquiringly at his guest. "I come to ask a great boon of you," continued the Professor, "and I must depart hence if you refuse it me."

"Speak out, Professor," replied he.

"It is impossible for us to continue any longer in the easy relations of host and guest. I seek to gain the affections of your daughter Ilse."

The proprietor started, and the hand of the strong man grasped the table.

"I know what I am asking of you," cried the Professor, with an outburst of feeling. "I am calling upon you to give me your greatest treasure; I know that it will make your life poorer, for I shall deprive you of that which has been your joy, help and pride."

"And so," murmured the proprietor, gloomily, "you anticipate what the father would say."

"I fear that at this moment you consider me an intruder into the peace of your home," continued the Professor; "but though it may be difficult for you to be indulgent towards me, you ought to know all. I first saw her in the church, and her religious fervor impressed me powerfully. I have lived in the house with her, and felt more every hour how beautiful and lovable she is. The influence she exercises over me is irresistible. The passion with which she has inspired me has become so great, that the thought of being separated from her fills me with dismay. I long to be united to her and to make her my wife."

Thus spoke the scholar, as ingenuously as a child.

"And to what extent have you shown your feelings to my daughter?" asked the father.

"I have twice in an outburst of feeling pressed her hand," answered the Professor.

"Have you ever spoken to her of your love?"

"If I had I should not stand before you now as I do," rejoined the Professor. "I am entirely unknown to you, and was brought here by peculiar circumstances; and I am not in the happy position of a wooer who can appeal to a long acquaintance. You have shown me unusual hospitality, and I am in duty bound not to abuse your confidence. I will not, unbeknown to you, endeavor to win a heart which is so closely bound up in your life."

\*Copyrighted.

The father inclined his head assentingly. "And have you the assurance of winning her love?"

"I am no child and can see that she is warmly attached to me. But of the depth and duration of the feelings of a young girl neither of us can judge. At times I have had the blessed conviction that she had a tender feeling for me, but it is just the unembarrassed innocence of her feelings that makes me uncertain; and I must confess to you that I think it possible these feelings may pass away."

The father looked at this man who was endeavoring to judge impartially, but whose whole frame was trembling. "It is, sir, my duty to yield to the wishes of my child's heart, if they are powerful enough to induce her to leave her home for that of another man—provided that I myself have not the conviction that it would be detrimental to her happiness. Your acquaintance with my daughter has been so short that I do not feel myself in the difficult position of having to give my consent, or to make my daughter unhappy, and your confession makes it possible for me to prevent what would, perhaps, in many respects, be unwelcome to me. Indeed, you are even now a stranger, and when I invited you to stay with us I did something that may have an unfortunate result for me and mine."

As the proprietor spoke thus in the excitement of the moment, his eyes fell upon the arm which had bled yesterday, and then on the manly features of the pale countenance before him. He broke off his speech, and laying his hand on the shoulder of the other exclaimed:—

"No, that is not the feeling of my heart, and I ought not to answer you thus."

He paced up and down the room endeavoring to be composed.

"But you also must listen to a word in confidence, and do not be angry with me," he continued, more tranquilly. "I know very well that I have not brought up my daughter for myself, and that I must at some time accustom myself to do without her; but our acquaintance is too short to judge whether my child would find peace or happiness if she were united to you. When I tell you that I esteem you and take pleasure in your society, that has nothing to do with the present question. If you were a country gentleman like me, I should listen to your communications with a lighter heart, for during the time of your stay here I should have been able to form a decided opinion of your qualifications. The difference of our vocations makes it not only difficult for me to judge of you, but also dangerous for the future of my child. If a father wishes that his daughter should marry a man who has similar occupations to himself, he is justified in so doing in every sphere of life, and more especially as a country gentleman of my stamp; for the qualifications of our children consist partly in this, that

they grow up as the helpmeets of their parents. What Ilse has learnt in my house gives me the assurance that, as the wife of a country gentleman, she would fill her place perfectly; nay, she might supply the deficiencies of her husband, and that would secure her a comfortable life, even though there were something more to be desired in the husband. As the wife of a Professor, she will have little use for what she knows, and she will feel unhappy at not having learnt many other things."

"I admit that she will be deprived of much; I lay little stress on what you might call her deficiencies," said the Professor. "I request you to trust this matter to me and the future."

"Then, Professor, I will answer you as candidly as you have spoken to me. I must not decline your proposal hastily. I will not oppose what may perhaps be for the happiness of my daughter; and yet I cannot, with the imperfect knowledge which I have of your position, agree to it. I am at this moment in the awkward position of not knowing how I can obtain this knowledge."

"I can well understand how unsatisfactory to you must be any opinion concerning me which you may obtain from strangers; yet you will have to be content to do so," answered the Professor with dignity.

The father assented silently.

"First, I beg to inform you concerning my financial circumstances."

He mentioned his income, gave a faithful account of the sources from which he derived it, and laid a written statement on the writing-table.

"My legal adviser, who bears a high repute in the University, will give you any confirmation you may wish of these details. With respect to my capacity as teacher and my position at the University, I must refer you to the judgment of my colleagues and the opinion which is held concerning it in the city."

The proprietor looked at the statement.

"Even the significance of these sums as regards your position is not quite clear to me. Having no acquaintance in your town, I have no facilities for obtaining further information concerning you. But, Professor, I will without delay endeavor to obtain all the information I can. I will start for your home to-morrow."

"Oh, I thank you," exclaimed the Professor, grasping his hand.

"Not yet," answered he, withdrawing it.

"I will, of course, if you like, accompany you," continued the Professor.

"I do not wish that," replied the proprietor. "Only write letters of introduction for me to your acquaintances; for the rest I must rely upon my own inquiries and on chance. But, Professor, this journey will only confirm your statements, of the truth of which I am already convinced, and I may obtain the judgment of others concerning you, which will no doubt accord

with mine. But let us suppose that the information is satisfactory to me, what will be the consequence?"

"That you will permit me to prolong my stay in your house," said the Professor; "that you will trustingly permit me to pay my addresses to your daughter and that you will give your consent to our marriage as soon as I am certain of your daughter's affection."

"Such arrangements for wooing are uncommon," said the father, with a saddened smile; "but they are not unwelcome to a farmer. We are accustomed to see fruits ripen slowly. Thus, Professor, after my journey we shall all three retain freedom of choice and a final decision. This conversation must remain secret."

"That is also my desire," said the Professor.

Again a slight smile flitted over the grave countenance of the host.

"In order to make so sudden a journey less surprising you had better remain here; but, during my absence, refrain from any increase of intimacy with my daughter. You see what great confidence I place in you."

Thus the Professor had compelled his host to become the confidant of his love. It was a delightful compact between passion and conscience that the scholar had entered into, and yet there was an error in this arrangement. The agreement, which he had effected with eager spirit and beating heart, turned out a little different to what he had represented to himself and to the father; for, between the three individuals who were now to enter upon this high-minded method of wooing, all easy intercourse had suddenly vanished. When Ilse, beaming with happiness, met the gentleman on the morning of the eventful conversation, she found her heaven obscured and overshadowed with dark clouds. The Professor was uneasy and gloomy; he worked almost the whole day in his room, and when the little ones in the evening begged him to tell them some stories, he declined, took hold of the head of the little sister with both hands, kissed her forehead and laid his own head upon it as if he wished the child to support him. The words that he addressed to Ilse were few and constrained, and yet his eyes were fixed incessantly upon her, but inquiringly and doubtfully; and Ilse was surprised also at her father, who appeared absent-minded and sorrowful. A secret had arisen between her father and herself that deeply absorbed him; nay, even between the two men matters were not as they had been. Her father, indeed, spoke sometimes in a low voice, to the friend, but she observed a constraint in both when they talked on indifferent subjects.

Then the next morning there was the secret journey of the father, which in few words he described, as on unimportant business. Had everything changed about her since that eventful evening? Her heart beat anxiously. A sense of insecurity came over her—the fear of something that would be adverse to her. Sor-

rowfully she withdrew to her room, where she struggled with bitter thoughts and avoided being alone with the man she loved.

Of course the change in the loved one became at once perceptible to the Professor, and it tortured the sensitive man. Did she wish to repel him in order not to abandon her father? Had that been only pleased astonishment which he had taken for affection of the heart? These anxieties made his demeanor constrained and unequal, and the change in his frame of mind worked again upon Ilse.

She had joyfully opened the flower-bud of her soul to the rising light, but a drop of morning dew had fallen into it and the tender petals had closed again under the burden.

Ilse had acted as doctress to all the illnesses and wounds that happened on the estate; she had succeeded her mother in this honorable office; her fame in the district was not small, and it was not an unnecessary accomplishment, for Rossau did not possess even one regular practitioner. Ilse knew how to apply her simple remedies admirably; even her father and the inspectors submitted themselves obediently to her care. She had become so accustomed to the vocation of a Sister of Charity that it did not shock her maidenly feelings to sit by the sick-bed of a working man, and she looked without prudery at the wound which had been caused by the kick of a horse and the cut of a scythe. Now the loved one was near her with his wound, not even keeping his arm in a sling, and she was fearful lest the injury should become greater. How glad she would have been to see the place and to have bandaged it herself!—and in the morning, at breakfast, she entreated him, pointing to his arm: "Will you not, for our sakes, do something for it?"

The Professor, embarrassed, drew his arm back and replied, "It is too insignificant."

She felt hurt, and remained silent; but when he went to his room her anxiety became overpowering. She sent the charwoman, who was her trusty assistant in this art, with a commission to him, and enjoined her to enter with an air of decision and, overcoming any opposition of the gentleman, to examine the arm and report to her. When the honest woman said that she was sent by the young lady and that she must insist upon seeing the wound, the Professor, though hesitatingly, consented to show his arm; but when the messenger conveyed a doubtful report, and Ilse, who had been pacing restlessly up and down before the door, again ordered cold poultices through her deputy, the Professor would not apply them. He had good reason; for however painfully he felt the constraint that was imposed upon him in his intercourse with Ilse; yet he felt it would be insupportable entirely to lose sight of her and sit alone in his room with a basin of

water. His rejection of her good counsel, however, grieved Ilse still more; for she feared the consequences, and, besides, it pained her that he would not accede to her wishes. When, afterwards, she learnt that he had secretly sent to Rossau for a surgeon, tears came into her eyes, for she considered it as a slight. She knew the pernicious remedies of the drunken quack and she was sure that evil would result from it. She struggled with herself until evening; at last, anxiety for her beloved overcame all considerations, and when he was sitting with the children in the arbor, she, with anguish of heart and downcast eyes, thus entreated him: "This stranger will occasion you greater pain. I pray you, let me see the wound."

The Professor, alarmed at this prospect which threatened to upset all the self-control which he had attained by laborious struggling, answered, as Ilse fancied, in a harsh tone—but, in truth, he was only a little hoarse through inward emotion—"I thank you, but I cannot allow that."

Ilse then caught hold of her brother and sister who had been in the hands of the gypsies, placed them before him, and exclaimed eagerly: "Do you beseech him, if he will not listen to me."

This little scene was so moving to the Professor and Ilse looked, in her excitement, so irresistibly lovely, that his composure was overpowered; and, in order to remain faithful to the father, he rose and went rapidly out of the garden.

Ilse pressed her hands convulsively together and gazed wildly before her. All had been a dream; the hope she had entertained in a happy hour that he loved her had been a delusion and she had revealed her heart to him and her warm feelings had appeared to him as the bold forwardness of a stranger. She was in his eyes an awkward country girl, deficient in the refined feelings of the city, who had got something into her foolish head because he had sometimes spoken to her kindly. She rushed into her room; there she sank down before her couch and her whole frame shook with convulsive sobs.

She was not visible for the rest of the evening. The following day she met the loved one proudly and coldly, said no more than was necessary and struggled secretly with tears and endless sorrow.

All had been arranged for a refined and decorous wooing; but when two human beings love each other they ought to tell each other so frankly and simply without any previous arrangement, and, indeed—without reserve.

The father had started on his journey; he gave as an excuse some business which he meant to transact on the road. The day following his powerful form and anxious countenance might be seen in the streets of the University town. Gabriel was much astonished when a

gigantic man, taller than his old friend the sergeant-major of the cuirassiers, rang at the door and brought a letter from his master, in which Gabriel was ordered to place himself and the lodging at the disposal of the gentleman. The stranger walked through the rooms, sat down at the Professor's writing-table and began a cross-questioning conversation with Gabriel, the tenor of which the servant could not understand. The stranger also greeted Herr Hummel, then went to the University, stopped the students in the street and made inquiries of them; had a conference with the lawyer; visited a merchant with whom he had had dealings in corn; was conducted by Gabriel to the Professor's tailor, there to order a coat, and Gabriel had to wait long at the door before the gossiping tailor would let the stranger go. He also went to Herr Hahn to buy a straw hat; and in the evening the tall figure might be seen uncomfortably bent under the Chinese temple, sitting by Herr Hahn, with a flask of wine. It was a poor father anxiously seeking from indifferent people intelligence which should determine whether he should give his beloved child into the arms of a stranger. What he learnt was even more favorable than he expected. He now discovered what Frau Rollmaus had long known, that he whom he had received into his home was, according to the opinion of others, no common man.

When, on returning home the evening of the following day, he reached the first houses of Rossau, he saw a figure hastening towards him. It was the Professor, who, in impatient expectation, had come to meet him and now hastened up to the carriage with disturbed countenance. The proprietor sprang from his seat and said gently to the Professor:

"Remain with us, and may Heaven give you every blessing."

As the two men walked up the foot-path together, the proprietor continued, with a sudden flash of good humor:

"You have compelled me, dear Professor, to act as a spy about your dwelling-place. I have learnt that you lead a quiet life, and that you pay your bills punctually. Your servant speaks reverentially of you, and you stand high in the opinion of your neighbors; in the city you are spoken of as a distinguished man, and what you have said of yourself is in all respects confirmed. Your lodgings are very handsome, the kitchen is too small, and your storeroom is smaller than one of our cupboards. From your windows you have at least some view of the country."

Beyond this not a word was spoken concerning the object of the journey, but the Professor listened hopefully to the other observations of the proprietor, how opulent were the citizens, and how brilliant the shops, also of the height of the houses in the market-place, the throngs of people in the streets, and of the pigeons, which, according to old custom, were kept by the town

council, and boldly hopped about like officials among the carriages and the human beings.

It was early morning, and again the first rays of the sun warmed the earth. After a sleepless night, Ilse hastened through the garden to the little bath-house which her father had built among the reeds and bushes. There she bathed her white limbs in the water, dressed herself quickly and ascended the path which passed by the grotto to the top of the hill, seeking the rays of the sun. As she knew that the cool night air still lay in the lower ground, she climbed still higher, where the hill declined steeply towards the grotto down into the valley. There she seated herself on the declivity amongst the copse, and far from every human eye, drying her hair in the sun's rays and arranging her attire.

She gazed upon her father's house where she supposed the friend still lay slumbering, and looked down before her on the stone roof of the grotto, and on the large tuft of the willow rose, with the white wool of its seed bursting from the pod. She supported her head on her hand, and thought of last evening. How little he had spoken, and her father had scarcely mentioned his journey. But whatever anxious cares passed through her mind, her spirits had been refreshed by the sparkling water, and now the morning cast its mild light over her heart.

There sat the child of the house. She wrung the water out of her hair and rested her white feet on the moss. Near her the bees hummed over the wild thyme, and one little worker circled threateningly round her feet. Ilse moved, and pushed one of her shoes; the shoe slid down, then turned over and went bounding over moss and stone, till it leapt by the willow rose and disappeared in the depth. She put on the fellow of the fugitive and hastened along the path to the grotto; turning round the corner of the rock she stepped back startled, for in front of the grotto stood the Professor, thoughtfully contemplating the embroidered arabesques of the shoe. The sensitive man was scarcely less startled than Ilse at this sudden encounter. He also had been impelled to go out into the early morning, to the spot where first the heart of the maiden had revealed itself to him; he had seated himself on a stone at the entrance, and leant his head against the rock in deep and sorrowful thought. Then he heard a soft rustling, and, amidst gravel and sand, a little masterwork of art fell close to his feet. He hastened forward, for he guessed at once to whom the bounding shoe belonged. Now he saw the loved one standing before him, in a light morning dress, enveloped in her long blond hair, resembling a water fairy or a mountain nymph.

"It is my shoe," said Ilse, with embarrassment, concealing her foot.

"I know it," said the man of learning, equally embarrassed, pushing the shoe respectfully to the border

of her dress. The shoe was quickly slipped on, but the short glimpse of the white foot suddenly gave the Professor heroic courage, such as he had not had for the last few days.

"I will not move from this spot," he cried, resolutely.

Ilse drew back into the grotto and gathered her hair into the net she held in her hand. The Professor stood at the entrance of the holy place; near him hung the long shoots of the blackberry, the bees hummed over the wild thyme, and his heart beat. When Ilse, with blushing cheeks, stepped out of the grotto into the light of day, she heard her name uttered by a voice in deep emotion, she felt her hand pressed, an ardent look shot from those true eyes, sweet words fell from his lips, his arm clasped her, and she sank silently on his heart.

As the Professor himself had on another occasion explained, man sometimes forgets that his life rests on a compact with the overwhelming powers of nature, which, unawares, counteract the little lords of the earth; thus the like unexpected powers now controlled the Professor and Ilse. I know not what powers of nature sent the bees, or threw the shoe; was it the elves in whom Ilse did not believe; or was it one of the antique acquaintances of the Professor, the goat-footed Pan, who blew his reed pipes in the grotto?

The wooing had begun in a learned manner, but it had been brought to a conclusion without any wisdom. There were two large and pure hearts which now beat against each other, but to say all in one word, the fastidious Professor had at last wooed his bride when she had no stockings on.

#### CHAPTER XI.

##### SPITEHAHN.

Raven-black night brooded over the hostile houses; the world looked like a great coal-pit in which the lights had been extinguished. The wind howled through the trees of the park; a rustling of leaves and crackling of branches was heard. Nothing was to be seen but a monstrous black curtain that concealed the neighboring wood and a black tented roof which was spread over the houses. The streets of the city were empty: all who liked their beds had been long lying therein, and whoever possessed a nightcap had now pulled it over his ears. Every human sound was silenced, and the striking of the tower-clock was intercepted by the stormy winds, and each tone was driven hither and thither, so that no one could count the midnight hour; only round the house of Herr Hummel the yelping dogs pursued their wild career in the courtyard, undaunted by storm or darkness; and when the wind blew like a buglehorn between the houses, the pack barked sleep away from men by their horrible hue and cry.

"This night suits them well," thought Gabriel, in his room. "This is just the weather for them." At

last he slept, and dreamt that the two dogs opened the door of his room, placed themselves on two chairs before his bed and alternately snapped their pocket pistols at him.

As he was lying in this unquiet sleep, there was a knock at his door.

"Get up, Gabriel," called out the old porter from the factory; "a misfortune has happened."

"Through the dogs," exclaimed Gabriel, springing out of bed.

"Some one must have broken in," cried the man again, through the door; "the dogs are lying on the ground."

Gabriel, alarmed, put on his boots and hastened into the yard, which was dimly lighted by the dawn. There lay the two poor watch-dogs on the ground, with no other sign of life but helpless writhing. Gabriel ran to the warehouse, examined the door and windows, and then the house; every shutter was closed, and no sign of disturbance could be discovered. When he returned, Herr Hummel was standing before the prostrate dogs.

"Gabriel, a dastardly deed has been committed here. Something has been done to the dogs; let them both lie there; an investigation must take place. I will send for the police."

"Indeed?" answered Gabriel; "compassion should come first, then the police. Perhaps something may yet be done for the poor brutes."

He took the two animals, carried them to the light, and examined their condition.

"The black one is done for," he said, compassionately. "The red one has still some life."

"Go to the veterinary surgeon, Klaus," exclaimed Herr Hummel, "and ask him to do me the favor to get up at once; he shall be remunerated. This case must be put into the daily paper. I require satisfaction before the magistracy and town council.—Gabriel," he continued, in angry excitement, "they murder the dogs of citizens; it is a work of mean malice, but I am not the man to put up with such assassins. They shall be made an example of, Gabriel."

Meanwhile Gabriel stroked the fur of the red dog, which rolled its eyes wildly under its shaggy brow and stretched out its paws piteously.

At last the veterinary surgeon came. He found the whole family assembled in the court. Frau Hummel, still in her night-dress, brought him a cup of coffee, while drinking which he sympathized with them, and then began the examination. The verdict of the expert hinted at poisoning; the dissection showed that a little dumpling with arsenic had been eaten, and what still more vexed Herr Hummel, there were glass splinters besides. For the red one there was a doubtful prospect of recovery.

(To be continued.)

BY W. PREYER.

Part I.

*Translated from the German by F. W. Morton.*

He who wishes to investigate a natural phenomenon seeks first to discover all the conditions which necessarily attend it, and of which the non-fulfillment of a single one suffices to bring the observed occurrence completely to a standstill.

If, after preliminary work, the physicist believes he has ascertained all the conditions of a motion, he adds to this analytic method the synthetic, in that with all the assistance of science and technics he artificially produces these conditions. If these were rightly and fully observed, the phenomenon must take place of necessity. If, however, the means for an artificial experiment are wanting, a prediction as to the event under consideration is made. The astronomer foretells with certainty an eclipse of the sun, and it takes place exactly, even to the second, at the time given—a proof that in this case all the conditions are known. The same is true of some chemical facts. The nature of water has been so accurately investigated that at any moment it can be artificially produced from its gaseous elements, hydrogen and oxygen.

But in these two cases, as in all where the conditions of a phenomenon can be fully produced, something still remains entirely unknown. Gravitation, which holds together the world's structure, is for the astronomer in its inmost essence a problem not yet solved. He deals with it only as with something definitely given when he predicts centuries ahead. The chemist, who artificially produces a well known chemical union by the conjunction of its constituent parts, proceeds in the same way. He operates with chemical affinity without having the least conception of its real nature. Attraction and affinity are only words to mask the ignorance of the investigator. Still these indistinct conceptions cannot be dispensed with; they are of the greatest service for an understanding of the world. They must remain until in the future, if ever, they are supplanted by clear perceptions.

The mystery which always attaches even to the best known natural phenomena and to the explanation of them, is nowhere felt in so striking a way as in the investigation of life.

In whatever way the physical principles are applied to the living, they are all too often of no service whatever. The manifestations of life, in spite of all attempts to understand them, offer more of the wonderful than of the comprehensible.

Even when we begin with the lowest living beings, we cannot succeed in ascertaining all the conditions of their existence. Take, for instance, those forms of life which consist merely of a tiny lump of tough slimy material. They breathe, nourish themselves, change their form, move from one place to another and multiply by division. They are without organs; on all sides of their body they are apparently the same; they are not animal, not plant, but merely living forms. To science they are a mystery. Their chemical composition is unknown; the cause of their motion not less. To this we must add that these beings know not a natural death. As soon as a certain age is reached they divide into two parts and continue to live double, then four-fold, then eight-fold, and so on till by lack of space and nourishment further division is prevented. Then the youngest generation is consumed by the animals of the sea. Death by reason of old age is therefore not possible for these beings, for in the bloom of life they divide themselves into twos and succumb only to violence.

Higher organisms, on the other hand, like man, finally reach a point of time when life becomes extinct. And this takes place even in the best of health, when they are careful in action and hardened in person, whether they live in the feasts of abundance or in catonic abstinence; and that, too, without our being able to assign for it a sufficient cause. The wearing out of the organs is just as incomprehensible in old age as in youth, in so far as they receive the same good nourishment for their support. As a matter of fact they no longer utilize this nourishment so completely, and that in all probability from a good reason, viz.: because in the course of a long life a great number of imperceptible losses have wrought their effects upon the organism. These, each one taken by itself, do not in a perceptible way work disadvantageously on the processes of restoring the worn-out tissue, but when taken together, they break the opposing strength of the body so that at last it succumbs on the slightest occasion.

Fundamentally, however, this is to be taken only as a supposition. The real cause of natural death is un-

known, and the certainty which stamps mortality upon every living thing is purely inductive. Because it has never been observed that a living body has passed a certain age, the conclusion is rightly drawn that it can never happen that a living being will not die or its individual existence find no end.

Thus, even in its first steps, the investigation of life meets an enigma. It cannot discover why, in the natural course of events, death necessarily inheres in every organism after a certain time.

If we start, therefore, simply from the standpoint of the experimental physicist and regard life like any other natural process, the question as to the conditions which must necessarily be fulfilled, that this process may take place, cannot fully be answered. For if all the conditions of life, with exception, were known, the nature of death would also be known, so far, at least, as it takes place through the failure of any one of the conditions demanded.

Nevertheless, a complete answer to this question is of great interest, because it would afford a glimpse into the dependence of all life upon its environment. Those circumstances which have heretofore been known as the general conditions of life, bear essentially, therefore, on an explanation of the conception of life. A comprehensive treatment of them, moreover, is afforded by their purely real contents.

By general conditions of life are to be understood only such as apply without exception to all living beings. We have to do, therefore, with discovering the circumstances which are not less indispensable to life for the tiny rotifer in the depths of the sea than for the condor which soars with strong wing over the highest peaks of the Cordilleras. We have to find what is indispensable to life alike for the wretched lichens growing on weathered rocks and for the palm unfolding itself in full beauty, for the microscopical yeast cell and for the scientist who observes it. All plants, all animals and men must have certain necessities of life in common, since they all live. Thus generally considered on account of great manifoldness of organized bodies, the number of conditions of life can only be small. Experiment alone teaches us to know them. Only by observation and experiment can they be acquired.

First, as many *uninjured* living beings as possible must be sought in their *natural* environment. We find even on a superficial observation that at a certain depth in the earth and at a certain height above the level of the sea no life can exist, that life is also diminished amid the ice at the poles and in the dry sands of the deserts.

Then *artificially changed* organisms must be considered in their *natural* environment. When, for example, some of the parts of an animal are skillfully removed life can often continue without change of en-

vironment. We ascertain in this way which organs are indispensable for the preservation of life and which are dispensable.

Incomparably richer in results than this sort of investigation is the *artificial changing* of living beings in connection with a simultaneous *change of environment*. If a plant grows up from the seed in cold and darkness so that it is not green, and is then exposed to light of a single color, we have an anomalous organism in an anomalous environment, and can determine what sorts of light permit and necessitate the supplementary formation of green on the leaf.

Not less important for the question under consideration are, finally, those experiments by which *uninjured* organisms become displaced in a *changed* environment. If a green plant be brought into a space filled with pure blue light it dies. For the maintenance of its health, therefore, other constituents of the daylight than blue are demanded. To determine the conditions of life we must regard as of especial importance such changes of natural surrounding as produce a withdrawal of some one material which stands in intimate relation with the living organism. If, still to cling to our example, all iron be withdrawn from the nourishment of green plants—and that, too, if possible, without other change of environment—a green-sickness takes place; and if care be not soon taken for a renewal of the supply life becomes extinct. Iron, therefore, must be regarded as a necessity of life so long as no other element closely related to iron can be proven to take its place without fatal results. For manganese and nickel this proof is furnished. Therefore, with a high degree of probability we may assert that the presence of iron in the food is a life-necessity for green plants.

The *general* conditions of life, which have been acquired by this four-fold method of investigation, naturally fall into two great groups—the *outer* and the *inner*. The one has reference to the surroundings of the living object; the other has to do with the formation of the organism which is necessary for its conservation—its chemical composition and its anatomical structure.

Further, both the outer and the inner conditions of life are in part *mediate* or *indirect* and in part *immediate* or *direct*. We have to determine what suffices to prolong mere life for a period, i. e. what is directly demanded by it, and what is necessary to maintain full health or normal life, which is characterized thereby, so that all functions reach their complete unfolding.

Now, the *indirect external conditions* necessary for this are so complicated that even now they can neither be reviewed nor investigated so as to determine wherein their significance really lies. One such condition, however, is the association of several, viz.: society.

Experience teaches us that a living thing will thrive only where other living things exist. Solitude is en-

tirely foreign to the realm of animated nature. All animated existence is mutually dependent; and if the temporary repose of an individual from the struggle for existence makes a passing isolation acceptable to him, still there is no living body that can permanently endure absolute solitude. But few know the indescribably desolate feeling of abandonment which overpowers the stranger, thirsting for knowledge, in an island, or amid great lava fields stretching over hundreds of square miles; with not so much as a voice in which he may forget himself such as even the glacial districts of the Alps pour down upon the unterrified hunter. No one for any length of time loves this gloomy silence, this death-like stillness of nature.

Although social life occasions great injuries to personal welfare, since each man in order to further his own interests comes into collision with others, still a society of many people, and above all the family, produces the greatest advantages for personal prosperity. For when many live together not only will the existing needs of life be more easily satisfied, and that, too, fully and regularly, but there arise through society new suggestions or desires which impart a new charm to life. Generally, so important are these advantages, made possible by society, for the furtherance of life in any of its phases, that society—and this holds good for all animated nature—becomes the most important of the indirect external conditions of life. And it becomes this largely because it alone permits the development of all talents, and thus preserves spiritual and physical health, that is, normal life. Not only must the necessary demands, as for example, that for food, be satisfied; but for full perfection those numerous needs are required which are newly created by society for its gratification. And these are without limitation from without and yet are not immeasurable.

This abundant supply of all the necessities of life is called luxury. It is found in all nature and at all stages of development of living beings, but never abundantly. That it should be desired is natural. Many condemn it, however, but chiefly for this reason: That the right measure of enjoyment is hard to find. Only so far as it takes into consideration the well-being of one man and that of his equally deserving fellow-beings is luxury harmless, permissible, right, advantageous, wholesome and necessary for normal life. So often as it degenerates it not only loses its advantages, but it becomes harmful. It then no longer enhances the capacity for the highest effort. In order to avoid this harmful degeneration moderation is necessary, for without this mankind cannot be kept from want or sickness. In itself undue self-denial, avarice—that which is called the non-fulfillment of the indirect conditions of life—is still more contrary to nature than the greatest luxury. The satisfaction arising from undue self-denial or forced

overstrained self-conquest is exceedingly slight. Besides, luxury, which as a rule could not exist but for society, is of the greatest advantage to the individual who rejoices in it without being degenerated by it; it is even more advantageous to society in general.

In the circles of the British nobility, where the greatest luxury prevails, longevity, good health and intelligence have almost become hereditary. Moreover, we speak here of luxury in its widest sense. There is physical luxury, human, animal, and plant luxury. Many animals kill more than they can consume, many collect so great a store that they are not able to use it. The most striking example of luxury in the animal world is afforded by the house-building birds of Australia, which, in addition to their nests, build shapely social houses and there give themselves up to all sorts of amusements. They build their nests on trees and their social houses on the level ground. The latter are adorned with all sorts of bright objects and flowers. These remarkable birds play with various colored stones and shells, while they frequently change the decorations of their houses. They caress and tease one another and entertain themselves actively in their exclusive clubs. Even in the vegetable kingdom such a luxurious life may easily be distinguished from those conditions of life in which everything needed, but nothing more than this, is at hand. Not merely by means of better soil and more copious light, nor by means of good nourishment and care, do many plants grow more luxuriantly. On the contrary, their thrift depends, in a large measure, upon the society in which they grow. The leaves in the primeval tropical forests never attain their strongest development unless the most powerful trees serve them. Such vine-growths really lead a luxurious life. They have in every respect more than they need, just like many a parasite of the animal kingdom.

*(To be continued.)*

#### KARL THEODOR BAYRHOFER AND HIS SYSTEM OF "NATURALISTIC MONISM."

BY EDMUND MONTGOMERY.

Part II.

We have seen that Bayrhofer, like Feuerbach and Strauss, turned away from the sterile and shadowy haunts of the purely conceptual world, and like these, his illustrious fellow dissenters of the left wing, he devoted himself all the more intently to the contemplation of the luxuriantly vivid and replete presence of the perceptible universe.

This richly saturated world of perception is, however, by no means so immediately within palpable reach of philosophical thought, as it is of sensible experience. To our direct perception the universe seems indeed composed of a multitude of diversely constituted bodies, extended in space and changing in time. And this material universe it is which, in the unsophisti-

cated estimate of us all, is carrying with it the entire wealth of Being. For Mind,—the only other mode of existence, of which we are cognizant, besides Matter, is evidently only an inner affection of some peculiarly organized bodies, forming part of this same all-comprising material universe. To plain common-sense it is the clearest possible fact, that the world of real Being is the same world we are from day to day actually perceiving.

Yet as soon as we set about scrutinizing somewhat more closely the relation of this perceptible world to our individual perception of it, perplexities arise that are strong enough essentially to disturb the intuitive assurance of the common-sense view. It requires, indeed, but little reflection to become positively aware that the material universe is in verity realized by us solely in the medium of our own consciousness; which consciousness is undeniably of mental and not of material consistency. Wherefrom irrefragably follows, that we know the material universe only mediately through mental representation.

Here, then, at once, inevitably, the central problem of philosophy offers itself for solution. It can nowise be ignored or eluded by whoever desires to recognize the true nature of Reality. And what thoughtful human creature does not crave to learn the secret of his own inmost nature, and how such nature is in truth connected with that abiding universal essence of Being, which underlies the ever-shifting phantasmagoria of sense-apparent manifestations?

Can anyone wonder that, struck with indefeasible longing for insight beyond the phenomenal play of individual perception, so many eager lives have spent the ardor of their vital spark in the endeavor to lay bare the solemn enigma of real Being? In what conceivable relation do those individual perceptions of ours stand to the actual world represented by them? How far do these mere mental figurations justify the framing of conceptions concerning the absolute nature of that, which from time to time is thus perceptively figured, but which must surely be itself steadfastly abiding in permanent existence, whether perceived by us or not? And in this soul-stirring solemnity of externally revealed and internally concealed existence, of what import is the little rôle we ourselves are playing? What is the true meaning of the open secret of Thought, Life and Being?

Undaunted by any failure of predecessors, they, whose gaze has penetrated beyond the "illusive veil of Maja," continue from century to century of human doom their eager questionings in search of veritable Reality. And to this exotic sect of philosophical ponderers, wrapped in wondering awe and super-individual hope, Bayrhafer belonged with soul and body. Touched from early youth with the frenzy that begets the transcendental mood to think and live as faithful exponent of the ever-valid world of reason, and not as one of the

common herd of self-seeking time-servers, he undeviatingly steered his course to the end.

No mere dreamer he! When, after a brilliant career as philosophical teacher and political leader, he found himself ousted of the academic chair and the parliamentary rostrum, he abundantly proved the practical strength and value of his reason-bred convictions. His humanitarian creed then flowed out, not in sentimental lamentations, but in courage and force to do battle against all manner of adversity. For the sake of his own manhood, and the welfare of his young brood of aspirants to human worth, he cheerfully and energetically adapted himself to the imposed situation. With rare fortitude he relinquished his habitual idealistic occupation with thoughts and words, entering resolutely with axe and plow upon a most realistic struggle for existence.

Figure the man, who had been a German professor of philosophy, forty years old already, actually making a living for himself and family by manual labor on a Wisconsin farm, thirty-six years ago. Surely a memorable event this for whoever happens to know of what strangely awkward stuff German professors were made in those days, and not again did our professorial farmer lay down his agricultural implements to return to his beloved realm of philosophical thought, until his children had grown up to be worthy citizens of the ideal humanitarian commonwealth, foreshadowed in the fundamental principles that had given republican independence and democratic stability to this his adopted country.

The first philosophical paper he allowed himself to write appeared in the third and fourth volumes of Bergmann's *Philosophische Monatshefte* seventeen years after he had settled on his farm. It contains a criticism of Herbart's, Hegel's and Spencer's systems, but fully adopting the naturalistic evolution-hypothesis. A year later, 1871, he published, also in German, a concise exposition of his views in a pamphlet bearing the title: *Das Wesen des Universums und die Gesetze des Humanismus, dargestellt aus dem Standpunkte der Vernunft*. Then in *The Journal of Speculative Philosophy*, January and October, 1876, "The Idea of Matter" and "The Idea of Mind."

These are the essential writings pointed out by himself to the present writer as conveying his matured thought. They were written after his health had been much impaired by the many years of unaccustomed hard labor. It is no easy task clearly to realize his views from his brief and abstruse exposition of them. But we will try to give a correct idea of his monistic foundation of the universe; for there can be no doubt that the monistic world-conception will have to be based on a groundwork similarly constituted.

Bayrhafer, as stated before, was a firm believer in the fundamental unity and essential identity of the ma-

terial and the mental worlds. But he did not believe that thought or intelligence is itself veritable Being. On the contrary, he looked upon that entity, which is consciously revealed to us in material appearances, as the true essence of Reality. With Kant, and in opposition to Hegel, he most positively maintained that that which is causing our individual space-perception to be filled with the specific content we call matter, is itself real, sense-stimulating Being, subsisting outside and independently of this perception of ours; which perception is therefore not merely an ideal product of our own obscure and inadequate introspective conception of an absolute reality which is itself Thought.

But, unlike Kant, he further asserts that there exists an essential identity of nature between the phenomenal or ideal appearances within our perception and the non-phenomenal or real efficiencies that arouse them from outside. This assertion goes right to the heart of the philosophical problem. If he can prove its validity, he has indeed discovered the long-sought-for monistic solution for the apparent duality of mind and matter in the domain of all-comprising Being.

It is, of course, easy enough to establish identity between Thought and Being, when with our thorough-going Idealists we simply maintain that Thought is itself Being, and that the belief in the existence of something stimulating our sensibility from outside is a mere illusion. Easy also to establish a pseudo-monism, in which mind and matter are seemingly one, when with many of our scientific philosophers we quietly lodge the requisite modicum of mental capacities in the primordial material elements with which the monistic universe is then built up.

But it should be clear by this time:—on the idealistic side, that our compulsory percepts are indeed aroused by external powers, whose distinguishing characteristics they faithfully represent;—on the materialistic side, that what we perceive as the material universe is merely a sense-stimulated phenomenon within our own perception, whose component parts—however much subdivided and finally atomized in conception—cannot, themselves, be placed in objective existence as the true elements of real Being.

Bayrhafer is lucidly aware that it can be only by means of a reasoned analysis and explanation of the sense-revealed universe that we can ever hope of gaining insight into the veritable nature of Being. He tells us plainly that "speculative thinking is alone capable of understanding and interpreting the ultimate nature of things."

It will be instructive to find out why this must be so. For it is one thing to profess, in a general way, belief in Monism, and quite another thing positively to demonstrate how mind and matter have in truth a common origin in universal Being. A creed, which desires to be

scientific, ought to give strict account of the reasons which determine it to adopt its fundamental tenets. Naturalistic Monists who fancy that their assumption of the unity and identity of mind and matter in nature is a self-evident truth or a readily demonstrable fact, are strangely mistaken. Even if—with all too bold a sweep—mind be hypothetically identified with force, and force with matter, it will be found a rather puzzling task to explain, or only to conceive, the interaction and transition into one another of these various modes of Being. Idealistic Monists have here an immense advantage, so far as facility of conception is concerned. They can positively prove that we are immediately aware only of mental existence; that all we know of nature appears within our own mental medium and is there mentally conceived by us. From this undeniable state of things they draw the easy conclusion that Mind is the sole mode of Being.

But believing—as we naturalistic thinkers most positively do—in sense-stimulating powers, we have inevitably to use our speculative reason in order to attain knowledge regarding these extra-conscious powers; for how otherwise could we penetrate beyond the immediate evidence of our senses. If the perceptive representation within our individual consciousness is indeed our sole revelation of the great outside universe of Being, then, obviously, there can be framed a consistent hypothesis concerning the veritable nature of that, which thus vicariously appears within our consciousness, only by means of a rational interpretation of the mental effects it arouses in us. No mere unreasoned observation of these mental effects, with ever so correct a description of their perceptual content and behavior according to the natural-science method, can possibly yield information regarding the permanent and efficient powers, of whose transient modes of interaction the representative percepts are just as transient a set of outcomes.

It is significant, in this connection, that mathematical Physicists, following consistently their method of accurate measurement and comparison of space and time-phenomena, are more and more completely abandoning all attempts to postulate or imagine any kind of absolute reality underlying or causing these perceptual appearances. They assume in their calculations no atoms or forces to account for so-called material phenomena; but work merely with definitely ascertained velocities of definite parts of space-occupation, as interlinked with one another, in so far only as changes in their motion, and therewith position are concerned. These Physicists are, in fact, if they only knew it, out and out Psychologists, having for their object of investigation nothing but changes of specific *percepts* within individual space and time-perception. But as these percepts happen to be faithful representations of the distinguishing characteristics of the sense-affecting influences, the peculiarities of

their perceptual motions turn out to be significant signs of peculiarities appertaining to the efficiencies of the interacting powers outside consciousness.

But can we ever gain any valid knowledge respecting the ultimate nature of that which stimulates our sensibility and arouses our percepts? Philosophers, who have realized the phenomenality of all perceptible occurrences within sense-revealed nature, have very generally denied the possibility of forming any conception whatever concerning the absolute nature of that which underlies the perceptual phenomena, and which consequently constitutes the veritable essence of Being. Whether with Kant this seemingly unrecognizable something be called the realm of Things-in-themselves, or with Spencer the Unknowable, the profession of nescience regarding its true nature is the characteristic mark of the philosophical Agnostic.

Bayrholder's chief effort is to overcome such Agnosticism. He seriously attempts to recognize the veritable nature of absolute Being, and gives good reasons why such nature should be cognizable. He argues that a separation and opposition of Being and Thought, Subject and Object, Percept and Thing, is merely an abstraction of consciousness, having no real validity. For all thinking occurs within Being; is indeed Being itself, exerting its own power of internal reflection or self-appearance. And such reflection is found to mirror not the subjective side only, but the entirety of Being, in which the objective side is always included. This argument is the argument of "Real-Idealism," and is in the strain of Schelling's thought. Bayrholder, from the standpoint of the Kantian relativity of knowledge adds, that a realizing subject, whose mental nature were so constituted as to be incommensurable with Reality, and not indeed wholly impregnated with it, would be simply an anti-natural monstrosity. Our perception and conception of Reality figures within a subjective focus nothing but Being itself in its various and variable forms; consequently a rational interpretation of such mental figuration must lead to a more and more complete recognition of absolute Being. Knowledge is, in fact, the self-revelation of such Being. And though progress toward complete truth is through one-sidedness, illusion and error, yet by dint of gradual rectification and amplification, we come to grasp more and more adequately that absolute truth, which fully reflects the veritable nature of All-Being. From the persistent matrix of perceptible phenomena has emanated our entire consciousness, and therewith our conception of the universe with all its present inconsistencies of mental apprehension. Surely, then, the same all-evolving matrix will have also power to evolve a solution of these inconsistencies.

Meanwhile Bayrholder thinks it incumbent on us to try to frame as consistent an hypothesis of the veritable

nature of Being as lies in our present power. This is what he attempts. And this is what has likewise been attempted, on similar lines of tradition and thought, by a far more renowned contemporaneous philosopher, who was fortunate enough to be allowed peacefully to pursue his thinking and teaching throughout a long and most successful career.

But how different the final conclusions arrived at by the conservative Lotze from those attained by our intrepid revolutionist. Lotze, building likewise on Kant's and Herbart's fundamental ideas, manages plausibly to deduce from his naturalistic Monadology the existence of a personal Deity and the confident belief in personal immortality. Bayrholder, following boldly the lead of a rationalistic interpretation of sense-revealed nature, is, on the contrary, unhesitatingly certain of the non-existence of a personal Deity, and the impossibility of personal immortality. Both thinkers believe the world and ourselves to be composed of monads, but Lotze's Monadology is imbued with a monarchical spirit; Bayrholder's is uncompromisingly democratic.

It would be well worth while carefully to compare the two systems, but this interesting task lies beyond our present purpose, which is to give an idea of Bayrholder's Naturalistic Monism, in which the interaction of equal and elementary Monads is made to give rise alike to material and to mental phenomena. We will now see how this is brought about.

#### THE SCHOLAR AS REFORMER.

BY MORRISON I. SWIFT.

If we disregard, as we must, the opinions of that great body of single-thoughted practical men whose education belongs to a day that the world cannot repeat, we do not underestimate the difficulties that their firmly held dogmas place in the path of reform. The problem before those who hope for better things is to change a society in which the refined vices of industrial self-interest are considered virtues, and which the best brains of the trading sphere are enlisted to amplify. It is not merely a dead weight of stolid conservatism that is to be lifted, although this is there; it is the vigorously working forces of triumphant selfishness and injustice that are to be met and dissipated before a better time can come. On the side of obstruction and retardation, in heavy force, are the conventionally moral men who extol the present working principles of society at the expense of those reforms that would bring the conception of human development into industrial relations. What forces then are available for reform?

It is certain that the high results of the moral revolution that we desire are not to be accomplished by men who have not themselves abandoned the lower ground occupied by prosperous humanity. Those who would help most in this supreme work must have severed

themselves from merely personal ends and inferior hopes. They must have gone down into the depths of life and of being, and gathered thence infinite inspiration and faith in the possibilities of man. The demand of the moment is in its fullest import for characters of this kind. They must care for no human opinion; they must be simple lovers of truth, ready to part with everything besides.

There are two classes that approach this type. Of one of these, the "masses," we shall speak hereafter. By the other we mean the educated men of the country.

The broad scholar of to-day must have imbibed something of the historic spirit. It is impossible for him to believe in the permanence of institutions in the sense that practical, unread men suppose them to be permanent. He sees that they have become what they are to fit human needs, and that as these needs change and enlarge the institutions must likewise be modified. He perceives, moreover, that this alteration has always been, and must ever be, along the line of the moral and ideal. For the moral and ideal are the same. The ideal is the material out of which the future real is to be elaborated. This passage from the momentarily real to the more moral or ideal is the essence of the life of individual and of humanity. One who does not recognize this and regard himself as a part of the race-process has not yet learned to live and does not know the depth of the meaning of duty. As man only lives successfully when he observes all the conditions that past development has imposed upon him, so he only lives fully when his life is ordered by the largest conception of the future that he can form. This, without postponement, is future life. And it is nothing more than the unchaining of the now. It is the crowding of the future, extended, temporal reality into the present; the refusal to sacrifice this future to a limited and false conception of the nature of the present and of life itself. For it is not the transportation of man out of himself into a nebulous and dreamed of unreality, the abandonment of his natural and sustaining environment, it is the enlarging of man to his own proper stature. Life is seldom conceived in its real breadth, and for this reason few gather to themselves its full richness. It will not be so conceived until the individual comprehends himself as the bearer of the race essence and as containing, in no merely figurative way, the temporal hereafter. This is man in his reality. Whoever lives for the mere present lives not for the real present, nor for more than a fragment of himself. It is the mission of the scholar to reveal this larger and encompassing world of his saner being, which is there to fructify and complete the lesser world to which he has arbitrarily confined himself.

But we trust the scholar for other reasons. The magic of rising above the hopes and fears of a world that is the product of a transcended past, is his birth-

right. If the prizes of human society are in the hands of practical, unhistoric men, they count for little with him; for they are prizes only in a world that denies life. It is base to live for these prizes as men commonly do, but it would be infinitely baser for one who has discerned the higher significance of living to lend himself to their pursuit. The vocation of the scholar is absolute and unswerving independence, and independence supremely of whatever survives from the past that is detrimental to human progress. And if he considers his momentary comfort in comparison with this stellar liberty, he, too, belongs to the past and is not worthy of his calling. We do not say that there are not such men, and perhaps many of them. But we say that such men are not worthy of their calling if they do not revolt against their own untruthfulness to truth. We do not doubt there are many scholars whose sole purpose in the pursuit of learning is a livelihood, or social position, or reputation, just as there are now many ministers with no higher object than these. But we expect nothing from such men. They are powerless to help in times like these.

Society has been wont to class certain well-defined and limited duties under the stereotyped idea of each profession. It has then said, "Let the shoemaker stick to his last," and frowned at innovation. Each brotherhood has its written or unwritten code, and the penalty of deviating is ostracism and sequestration. The physician may heal the poor without fees, but where is the medical man who is renovating the ideas of his community so as to avert sickness? The lawyer makes and nurses cases for his own profit, instead of preventing and adjusting them and thereby saving the client from sure depletion. The clergymen "sticks to the Bible" and "preaches Christ and Him Crucified," while the vast complex of information and instruction that should come through the modern pulpit is left untouched by him. The pulpit is sacred to antiquated doctrinism. The professional scholar, likewise, has an idea of his function conceived in medieval days and ossified in their inspiring atmosphere, and idolized by medievalists ever since. The professional scholar is bookish *par excellence*. He has the aroma of a seat of learning and thinks that the ways in which an intellectual man should walk have been discovered. The sunlight and opposing opinions dismay him. The pale cheek of a student is his highest consolation. "I do not want a student to injure his health," said one of these sages, "but I want him to come as near to it as he can." In his surrender to the cult of sanctioned learning he is as livid and orthodox as the highly-bred Calvinist is stark and steadfast to his fancies. This type has by natural evolution produced what, for distinction from the specific worker, who remains a congruous and approvable man, may be termed the unhumanized specialist. He must be in earnest only about the infinitesimal particular globe

in which his mind is accustomed to spin. He shall sedulously guard himself from any other interest, lest his mental top lose a revolution on the axis of its specialty. Woe, then, to him, for all that he esteems considerable has suffered a calamity. An irrevocable opportunity is gone.

Against these doctrinaires of preaching, and medicine, and learning or research, who rule in modern councils by the divine right of the insensate apathy of their companions in self-prolonged minority, the true scholar stands out. He is conscious that his class is not doing its legitimate work in the world because of its creed. As in religion, formalism has expelled substance. And this drags the scholar down to the common level. Individualism infects him with the rest. He acquiesces. Persevering adherence to the exceptional insights granted him, and duty to know and practise the laws of conduct declared in these clearer visions, he evades.

Hence scholars have not yet arrived at their true functions except in daring and unusual instances. They have not sought a profound comprehension of the meaning of life in its complexity and breadth, as every man and, most of all, every educator should. The conception of the education of humanity, of race-building, they have not cared to grasp. But these ideas are at length here, and it is required of each worker to relate himself anew and more vitally than before to the larger social unity. The movement of the world now forces the scholar to accept these issues. To him first the breath of a higher life should come. Those who are permeated by this new spirit are weary of the moral pause that has fallen upon the world. It rests with high-minded and independent characters, those of historic insight and original strength, to lift this blight and to bring to sensible existence a practical morality that corresponds to the highest conception of virtue that we have yet developed. It is for such men to guide the masses and to unfold instead of repressing them. This is the unrivaled opportunity of the present time. The problem is the application of all modern knowledge and energy to race expansion. The claim rests upon this generation to renounce its hoary contentment with conventional methods of doing and being good and to forge measures that are adequate to modern needs and shall supply a foundation for future human construction.

In fine, the scholar and such as feel with him the premonition of a new life are called upon to set themselves in complete and determined opposition to the abuses that prevail universally, to put the seal of condemnation upon ideas that even good men affectionately tolerate, to clear away the mystifying creeds and dogmas that hinder men of the highest purposes and lives from harmony with the organized good, to establish once and forever the truth that all men are born to live

moral and beautiful and expanding lives in whatever sphere they may labor, and that the paramount duty of the enlightened is to forswear class preference and privilege and enter the internecine struggle to lift up the whole human race.

These are large objects, but the time has arrived when they can no longer be postponed, and the scholar must accept them as the companion duty of his exceptional opportunities.

#### INFINITUDE AND ETERNITY.

Mr. L. T. Ives, in his letter on page 872 of *THE OPEN COURT*, refers to my essay of January 5th, entitled "The Unknowable." He sees no objection to considering abstracts or generalizations as *chiffres* for economizing thought; but he asks: "Does this class of thinking serve our purpose also with the word infinite?"

Yes, it does. But infinity does not mean, as Mr. Ives suggests, "the abstract of all finities;" it is the abstract of all infinities, i. e., it is a *chiffre* for anything which we think of without limits. An infinite decimal (say a recurring decimal) is a decimal fraction which we think of without a limit, for instance  $\frac{1}{3} = 0.333 \dots$  ad infinitum. Infinity is never a real thing. In order to use an infinite magnitude of any kind we must stop short when the error becomes indifferent. The decimal  $0.333 \dots$  is only equal to  $\frac{1}{3}$  when we continue with the threees after the decimal point ad infinitum, which is practically impossible as well as unnecessary. The infinite is therefore a name for a process without a definite limit which can be continued as long as one pleases and is only approximately finished if cut short; and infinitude is a generalization and a *chiffre* for all the infinities.

So far Mr. Ives agrees with me, I believe, and he states correctly that it is one and the same thing whether we measure with inches or sidereal distances (as are, e. g., the "light years," i. e., the distance which a ray of light travels in one year). Mr. Ives' issue is the infinitude of space, and it is this which he proposes as the problem, "about which it cannot truly be said 'there is no mystery.'"

And yet the infinitude of space is the same infinitude as any other mathematical infinitude. The problem of which Mr. Ives speaks has been solved by no less a one than the great sage of Königsberg, by Emanuel Kant.

It is a misapprehension to think that space is a reality, some object, something outside of us which exists as material things exist. Kant proved that objective space is an absurdity; it does not exist at all. He says in his "Transcendental Aesthetics" [Critique of Pure Reason, translated by J. M. D. Meiklejohn, page 42.]: "If we regard space and time as properties, which must be found in objects as things in themselves, as *sine quibus non* of the possibility of their existence, and reflect on the absurdities in which we then find ourselves involved,

inasmuch as we are compelled to admit the existence of two infinite things, which are, nevertheless, not substances nor anything really inhering in substances. Nay, to admit that they are the necessary conditions of the existence of all things, and moreover, that they must continue to exist, although all existing things were annihilated—we cannot blame the good Berkeley for degrading bodies to mere illusory appearances. Nay, even our own existence, which would, in this case, depend upon the self-existent reality of such a mere nonentity as time, would necessarily be changed with it into mere appearance—an absurdity which no one has as yet been guilty of."

Whatever are the points of difference between Kant's system and my own views, I agree with him when he declares that space is ideal, not real. Space is a conception of ours and nothing more; it is just as much a generalization as any other abstract. Space is abstracted from reality. We abstract extension and omit all material.

Space in and by itself—apart from reality—does not exist, save in our imagination. Hegel defines space as *Das Neben-ein-ander der Dinge*. We call it the possible direction of motion. If space is any possible direction of a point or a particle of matter, there can be no doubt as to the infinitude of space, for the possibility of motion is infinite in every direction. This fact is thus self-evident from the definition of space.

If we think of space as a real entity, it is the greatest mystery—a mystery which, we must confess, can never be solved. If with Kant we recognize that space is *ideal*, that it is an abstract, a *chiffre* for economizing thought, everything is clear, and there is just as little mystery in the infinitude of space as in the infinitude of a recurring decimal like 0.333. . . .

Accordingly, we may say, with Mr. Ives, that "space is the\* generalization of extension." But if he says "space is without limit," he should bear in mind that it means "the possibility of extending the possibility of motion in every direction is without a limit."

The only correct usage of the word infinite is that of the mathematical term. As a poetic license, however, we use it also in the sense of immeasurable. We speak of the infinite ocean and the interminable depth of the sea, although both are very definite and even not immeasurable. So also the "infinite" world, the universe is a definite reality. Certainly it is in its totality immeasurable; but we recognize that its energy as well as its matter of reality can neither increase nor decrease, a fact which is now indorsed by science and generally styled the law of conservation of matter and energy.

As of space, the same thing holds good of time. Time is also an abstract, or, as Kant says, it is ideal; time does not exist by itself. Schopenhauer is right in

saying that neither past nor future exist; the only real time is the present and it *is* always.

Time is a generalization or abstract of existence in regard to its continuance or possible change, but without reference to anything else, be it matter or form. Hegel calls it "*Das Nach-ein-ander der Dinge*." This can lead to a misconception if "*Dinge*" are taken in their totality as the world. The material things in their totality *are* always; they exist not one after another, but are simultaneous and are permanent. To express it in two words: *Reality is*, which *is* includes that it has existed and it is going to exist. Hegel's definition is correct in so far as things are considered as changeable forms. It is motion which changes things either in their mutual relation, or their forms. Time, accordingly, can only be measured by motion; and, indeed, time is the measure of motion and nothing more. If time is conceived as an objectively existing entity, we will soon find out that it is inconceivable and full of self-contradiction. Kant claims that objective time (just as much as objective space) is an absurdity.

Past and Future are still more complicated abstracts than the present. When conceiving them as objective existences, we are driven to statements which are inconceivable and impossible. They are without limit. Infinitude in time is called eternity. Eternity, conceived as a real thing, is a self-contradiction. If we require for some purpose the fraction  $\frac{1}{2}$  in the form of a decimal, we change it into 0.333. . . . This decimal fraction is, as all agree, a *chiffre* for a process of taking three units in every ten, and this process can never be finished. Accordingly, 0.3333. . . . is never equal to  $\frac{1}{2}$ ; we may carry the calculation to five, to ten, to a hundred or more decimals; it may be more than accurate for our special purpose, but 0.333. . . . never will be equal to  $\frac{1}{2}$ . If I would require to have an infinite decimal as is 0.3333. . . . in full, I would be made to understand that this demand is absurd and its realization impossible. We cannot finish it and cannot even conceive an infinite decimal finished. But we use where it is wanted a certain *chiffre* for indicating or symbolizing it.

The eternities of the Past as well as the Future are exactly such *chiffres*. And the eternity of the past, comprehending in one conception all the changes that Reality or the present existence suffered before having a form as at present, and the eternity of the future, meaning an indefinite and infinite possibility of change of states of things to come, both are fundamentally an eternity of the present time, which means that time must be conceived as limitless. Reality existed always and will exist always, and the possibility of change cannot be exhausted—or at least we can imagine it to be inexhaustible.

Time is an abstract from Reality, which by all its changes remains. Past, Present and Future are ab-

\*By the way, I say space is the (not a) generalization of extension.

stracts of the states of Reality, whether they are, or have been, or are going to be.

This form of expression is most correct for our present purpose, as it defines both past as well as future in the present tenses "they have" and "they are going to."

Time and space, infinitude and eternity are no mysteries unless we make them such by wrongly attributing to them a reality which they do not possess.

The nations of old worshiped Space and Time, Infinitude and Eternity, and we now smile and call them pagans. It is a paganism superior to fetishism, as its idol is woven out of the most delicate woof which can be obtained, viz.: the ideas of the thinker. But there is no essential difference; it is a difference of degree.

Kronos and his colleagues belong to the past, but the worship of eternity and infinitude still obtains among our present generation, and will continue to be an object of idolatry until we understand that infinitude and eternity are own creations.

P. C.

#### SUB SPECIE ÆTERNITATIS.\*

BY WM. SCHUYLER.

The perfumed blossoms hung upon the bough—

Like lovely Innocence it seemed to me

Of little worth, save that within it now

The germ of good or evil fruit might be.

Then from this selfsame blossom there did spring

First, unripe fruit which foul disease could breed;

Then grew life-giving, slowly ripening;

And then decayed—then sprang the fruitful seed.

So with our finite actions—all deeds done

For self alone like unripe fruit must be,

And when our good works through unreason run

Into excess, decaying fruit we see.

But when through love our deeds not only may

Bring good to self, but also to all men,

Then are they fully ripe—yet from decay,

Evil itself,—good seed may grow again.

From the same stem with evil grows the good;

For all things God-proceeding good must be

When in completeness they are understood

Under the full form of Eternity.

### CORRESPONDENCE.

#### AN INQUIRY ABOUT THE INFINITUDE OF SPACE.

In your article of January 5th, entitled "The Unknowable," you dispose so easily of problems that I had always felt to be perplexing, that it awakens in me the hope that you will give us further word on this subject, dealing more specifically with the questions involved.

Your article also prompts me to ask you one or two questions, which I trust you will excuse, and, if intelligibly presented, will answer.

\*Spinoza.

You say of matter "it is a *chiffre* or symbol," a "generalization"—Yes, I see no objection to that—matter is but a generalization of all forms of matter, and as such "no mystery about it." The word is, as you say, "a symbol for economizing thought"—So also in regard to all words expressing abstract ideas. It is but a mental process whereby we gather to a unit all concrete cases. There is no sin outside of sinners sinning, no love outside of lovers loving, but does this class of thinking serve our purpose also with the word infinite? You say yes, it too, is but a symbol and "no mystery about it." You would, I suppose, claim that infinity means simply the abstract of all finities just as one million is a generalized statement of that number of units. This is altogether thinkable, but to my mind, infinity means that which no adding of units will make, and to speak of "counting" to, or "wandering" to, infinity is like saying: "I started to walk upon a road that has no end, and I walked so long and so fast that I at last got to the end of it." When the word infinity is used, a something is expressed that cannot be made or reached by addition. In this respect it is certainly unlike anything with which we have had experience. The immense distances dealt with in astronomy, are, by simply enlarging our unit of measurement, as readily disposed of as measuring thirty-six inches of ribbon, and by a similar process. But when we come to something which no enlargement of our unit will affect, something to which the diameter of our sidereal system would be as a unit of measurement no better than the diameter of a sand grain, then surely we have reached a something not a symbol of anything save itself, and about which it cannot truly be said, "there is no mystery." Does not infinite space present this problem? You say, "beyond nature is empty non-existence." This empty non-existence is infinite room for existence, infinite space—space without limit. We say "without limit" because we cannot conceive it as having limit. The space we know here is not empty, so, judging from experience, there is reason to believe infinite space not empty—and the problem that presents itself to our thought is infinite fullness rather than infinite emptiness. But in either case the infinite element remains the same; and this is the one point to which I have wished to call your attention.

We may say the word space is but a generalization of all extension; but if we say "space is without limit," we affirm a fact about it which is not a generalization. We say of this affirmation, it is true, not because we comprehend it, but because, while realizing that we do not comprehend it, we yet feel that it must be, for every alternative thought on the subject, in its last analysis, throws us back on this one.

If you should ask for proof, I admit it is wanting; but certainly this is the thought the word infinite implies—not a generalization or symbol, but a something of which we have no proof, yet feel must be.

Yours truly,

L. T. IVES.

#### A READER OF THREE-SCORE-AND-TEN BRIEFLY DEFINES HIS MONISM.

To the Editor: MORRIS, GRUNDY Co., March 10, 1888.

I have a two-fold object in the present address:

One is the expression of appreciative pleasure felt in reading your interpretation of "Monism," of several months since, and to congratulate yourself and the managing board on the fact of putting THE OPEN COURT squarely on the Monistic issue.

I am astonished to see so many of your contributors, either careless or indifferent to this fundamental sentiment.

Nature presents no other field of labor for the Scientist but that of the Monistic order.

The second consideration is a personal matter in this same line of philosophy. Much of my time, for the last twenty-five years, has been devoted to the study of man as standing at the head of the phenomenal universe; and what was my great joy to

find, on reading the article above referred to, with many of your articles in harmony with Mr. Hegeler's sentiments, that the course of research adopted was strictly in line with this monistic philosophy.

He who follows Nature will, inevitably, travel in this path.

When the *bias of education* was overcome the following conclusions were self-evident:

1. That matter is the only constituent of the universe.
2. That matter, from whatever source, contained within itself all the attributes, powers and functions to do and accomplish all that is done by or with matter.
3. That matter must not only develop in the combination of forms, but that such perpetual evolution resulted, step by step, in a gradual refinement of matter so engaged.
4. The inevitable result, then, of such upward movement must reach the spiritual plane of matter in time. In short, I was driven to the conclusion that spirit is a sublimated essence of matter.

5. That the human origin is necessarily terrestrial, body, soul and spirit.

6. If man has a spiritual part it must of necessity contain the elements of immortality.

When I say that there are processes of the natural world recognizable by the human powers by which these facts can all be demonstrated, I speak what I do know. And if "*Science is the classification of natural facts in reference to principle*," the spiritual origin and his immortal existence of man can be brought within the range of demonstrated philosophy.

This is a wonderful age of discovery. The intellect of man is his sole reliance; and is it not quite as consistent that he should be spiritually blessed and comforted, while he is attaining to so many temporal blessings?

Feeling the promptings of a higher nature he cannot be supremely blessed until he can fairly fathom the depths of his own nature, as to his origin, to the make-up of his being, and his final destiny. If this philosophy has any fact in it, these problems are all solved on a "*scientific basis*." "Truth only wants a hearing."

L. A. FISHER.

Prof. Georg von Glözycki, by reason of the great distance, was unable to revise the translation and proof-sheets of his essay "Determinism versus Indeterminism" in Nos. 25 and 26 of THE OPEN COURT. In a letter which was received this week he praises the translation as being excellent, and requests at the same time that the following corrections and substitutions be made:

Page 730, column 2, line 11 from above, read: *Reasons are cognitions*, instead of: *Causes are acknowledgments*.

Page 731, column 1, line 6 from below, read: *regular*, instead of: *imperative*.

Page 731, column 2, line 4 from above, read: *some processes*, instead of: *all processes*.

Page 732, column 2, line 7 from above, read: *reason*, instead of: *cause*.

Page 732, column 2, line 17 from above, read: *annihilate*, instead of: *ignore*.

Page 733, column 2, line 12 from above, read: *contrary action*, instead of: *contradiction*.

Page 733, column 2, line 26 from above, read: *it has been said*, instead of: *as has been said*.

Page 733, column 2, line 13 from below, read: *like external circumstances*, instead of: *like circumstances*.

Page 762, column 1, line 20 from above, read: *this universe*, instead of: *this will*.

In No. 28 of THE OPEN COURT on page 808, in our review of "Theism or the Knowability of God," by the Rev. Henry Truro

Bray, M. A., LL.D., we inadvertently located the author in Boonville, Md., instead of Boonville, Mo. The book is published and sold by the author for 60 cents. The St. Louis *Republican* speaks of this publication in the following terms:

"The Broad Church has appeared. In its representative there is no concealment. It has moreover come with a force of conviction which will not easily be put down, and with a reasoned argument which it will tax the ability of his opponents to meet. . . . A lucid statement. . . . an able pamphlet. . . . likely to make him well known not only here but elsewhere."

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

### CHAPTER XI.—Concluded.

This was a gloomy morning for the Hummel family. Before breakfast Herr Hummel sat down to his writing table and composed an advertisement for the daily paper, in which ten thalers reward was offered to any one who would discover the malignant poisoner of his dog. The ten thalers were underlined with three dashes. Then he went to his window and looked savagely upon the haunts of his opponent and on the Chinese temple which had been the cause of this new disturbance. Then he turned to his wife and, pacing up and down, said:

"I have no doubt about the case."

"I do not understand you," answered his wife, who on this trying morning was taking a second breakfast; "and I do not understand how you can be certain in this matter. It is true that there is a something about those people which is always repugnant to us, and it may be a misfortune to have such neighbors. But you have no right to assume that they have poisoned the dogs. I cannot think that such an idea would have entered into the head of Frau Hahn. I admit that she is an ordinary woman, and the doctor says it was dumplings, which points to a woman as being the guilty one. But when our red dog was caught with the partridges in their kitchen, she sent me back the dog with her compliments, and she thought it was not good behavior in him, as he had eaten three of the birds. That was civil, and I can find no murderous intention in it. And he surely does not look as if he would do anything to our dogs at midnight."

"He is malicious," growled Herr Hummel; "but you have always had your own opinion about those people. He has been hypocritical toward me from the first day when he stood by his pile of bricks before these windows and turned his back to me. I have always allowed myself to be persuaded by you women to treat him as a neighbor with greetings and civil speeches; and I have been silent when you have carried on your idle gossip with the woman over there."

"Our idle gossip, Henry," exclaimed the wife, setting down her coffee-cup with a clatter; "I must beg of you not to forget what is due to me."

\*Copyrighted.

"Well, well, it was not unkindly meant," Herr Hummel hastened to add, in order to allay the storm which he had inopportunistically brought upon himself.

"What you meant you must know, I take it as I heard it; it shows little feeling in you, Hummel, on account of a dead dog to treat your wife and daughter as idle gossips."

This disagreement added still more to the gloom and ill-humor of the morning, but did not in any way advance the discovery of the culprit. It was in vain that the mistress of the house, in order to turn away her husband's suspicions from the Hahn family, raised many other conjectures, and, with Laura's help, tried to throw the blame on their own employes or the watchman, and that she at last suggested even the shop-porter over the way as the possible evil-doer. Alas! the reputation of the dogs was so dreadful that the Hummel family could easier count the few men who did not wish evil to the dogs, than the many whose wish and interest it was to see the monsters at Cocytus. The news ran like wildfire through the streets, there was a crowd round the fruit-woman as on 'Change, and people spoke of the evil deed everywhere without pity, hostilely and maliciously. Even among those in the streets who tried to show outward signs of sympathy, the prevailing feeling was hardly concealed. It is true there were some sympathisers. First Frau Knips, the washer-woman, with voluble indignation; then even Knips the younger ventured pityingly into the neighborhood of the house—he was a clerk in the hostile business, having gone over to the enemy, but never ceased to show respect to his former instructor on all occasions, and to pay unacceptable homage to Fräulein Laura. At last the comedian of the theater, whom they generally invited on Sundays, came, and related many amusing stories. But even these few faithful adherents were suspected by some of the household. Gabriel distrusted the Knips family and Laura detested the clerk, and the comedian, formerly a welcome guest, had, some evenings before, in passing by, inconsiderately expressed to a companion, that it would be a praiseworthy deed to remove these dogs from the stage of life. Now this unhappy idea was repeated to the mistress of the house, and it lay heavy on her heart. For fifteen years she had accepted this man's homage with pleasure, shown him much friendliness, and given him enthusiastic applause at the theater, not to speak of the Sunday dinner and preserves; and now when the buffoon lowered his head sympathisingly and expressed his horror, his face, from the long habit of comic action, lengthened itself so hypocritically, that Frau Hummel suddenly saw a devil grinning out of the features of the once valued man; her sharp remarks upon Judas frightened in return the comedian, because it revealed to him the danger of losing his best house of entertainment, and the more dolorous he felt, the more equivocal became his expression.

During all these occurrences the Hahn family kept quiet in the background. They displayed no signs of undue pleasure, and no unnatural sympathy came from the silent walls. But at mid-day, when Frau Hummel went to refresh herself a little in the air, she met her neighbor; and Frau Hahn, who since the garden scene had felt herself in the wrong, stopped and expressed her regret in a friendly way that Frau Hummel had experienced such an unpleasant accident. But the hostile feeling and suspicion of her husband echoed in the answer. Frau Hummel spoke coldly, and both separated with a feeling of animosity.

Meanwhile Laura sat at her writing-table, and noted down in her private journal the events of the day, and with a light heart she concluded with these lines:

"They're dead and gone! Removed the curse of hate—  
Erased the stain is from the book of fate."

This prophecy contained just as much truth as if, after the first skirmish of the siege of Troy, Cassandra had noted it down in Hector's album;—it was confuted by the endless horrors of the subsequent time.

At all events, Spitehahn was not gone; his life was saved. But the night's treachery had exercised a sorrowful influence on the creature, both body and soul. He had never been beautiful; but now his body was thin, his head swelled, and his shaggy coat bristly. The glass splinters which the skillful doctor had removed from his stomach seemed to have got somehow into his hairs, so that they started bristling from his body like a bottle-brush; his curly tail became bare, only at the end there remained a tuft of hair, like a bent cork-screw with a cork at the end. He no longer wagged his tail; his yelping ceased; night and day he roved about silently; only occasionally one heard a low, significant growl. He came back to life, but all softer feelings were dead in him; he became averse to human beings, and fostered dark suspicions in his soul; all attachment and fidelity ceased; instead of which he showed lurking malice and general vindictiveness. Yet Herr Hummel did not mind this change; the dog was the victim of unheard-of wickedness, which had been intended for the injury of himself, the proprietor of the house; and had he been ten times more hideous and savage to human beings, Herr Hummel would still have made a pet of him. He stroked him, and did not take it amiss when the dog showed his gratitude by snapping at the fingers of his master.

Whilst the flames of just irritation still shot forth from this new firebrand of the family peace, Fritz returned from his journey. His mother immediately related to him all the events of the last few weeks—the bell-ringing, the dogs, the new hostility.

"It was well that you were away. Have you always had a good feather bed? At the inns they are very regardless of the beds of strangers. I hope that in the

country, where they rear geese themselves, they may have shown more care. As regards this new quarrel, talk to your father about it, and do what you can to restore peace."

Fritz listened silently to his mother's account, and said soothingly:

"You know it is not the first time; it will pass over."

This news did not contribute to increase the cheerfulness of the Doctor. Sadly he looked from his room on the neighboring house and the windows of his friend. In a short time a new household would be established there; might not, then, his friendship with the Professor be affected by the disturbances which of old existed between the two houses? He then began to arrange the notes which he had collected on his journey, but the footsteps on the grotto gave him an uncomfortable feeling, and the track of the wild hunters made him think of Ilse's wise words, "It is all superstition." He put away his papers, seized his hat, and went out meditating, and not exactly gaily disposed, into the park. When he saw Laura Hummel a few steps before him on the same path, he turned aside, in order not to meet any one from the hostile house.

Laura was carrying a little basket of fruit to her godmother. The old lady was residing in her summer house in a neighboring village, and a shady footpath through the park led to it. It was lonely at this hour in the wood, and only the birds observed how free from care was the smile that played round the little mouth of the agile girl, and how full of glee were the beautiful deep blue eyes that peered into the thicket. But although Laura seemed to hasten, she stopped frequently. First it occurred to her that the leaves of the copper beech would look well in her brown felt hat; she broke off a branch, took off her hat, and stuck the leaves on it; and in order to give herself the pleasure of looking at it, she held her hat in her hand and put a gauze handkerchief over her head for protection against the rays of the sun. Then she admired the chequered light thrown by the sun on the road. Then a squirrel ran across the path, scrambled quick as lightning up a tree and hid itself in the branches; and Laura looked up and perceived its beautiful bushy tail through the foliage, and she fancied herself on the top of the tree, in the midst of the foliage and fruit, swinging on a branch, then leaping from one bough to another, and finally taking a walk—high in the air, on the tops of the trees—over the fluttering leaves as though upon green hills.

When she came near the water that flowed on the other side of the path, she perceived that a large number of frogs, sitting in the sun on the bank, sprang into the water with great leaps, as if by word of command, and she ran up to them and saw with astonishment that the frogs looked quite different in the water from what they did on land, not at all so clumsy; they went along

like little gentlemen with big stomachs and thick necks, but with long legs which struck out vigorously. Then when a large frog steered up to her and popped his head out of the water, she drew back and laughed at herself. Thus she passed through the wood, herself a butterfly, and at peace with all the world.

But her fate pursued her. Spitehahn had, from his usual place on the stone steps, watched her proceedings; from under the wild hairs which hung over his head like a moustache, he had squinted after her, got up at last and trotted silently behind her, undisturbed by the rays of the sun, the basket of fruit, or the red handkerchief of his young mistress. Between the town and the village the road ascended from the valley and its trees to a bare plain, on which the soldiery of the town sometimes practiced their drill, and where in peaceful hours a shepherd pastured his flock; the path ran obliquely over the open plain to the village. Laura stopped on the height at times to admire the distant sheep and the brown shepherd, who looked very picturesque with his large hat and crook. She had already passed the flock when she heard a barking and threatening cry behind her; she turned round and saw the peaceful community in wild uproar. The sheep scattered in all directions—some running away frightened, others huddled together in a ditch; the shepherd's dogs barked, and the shepherd and his boy ran with raised sticks round the disturbed flock. While Laura was looking astonished at the tumult, the shepherd and his boy rushed up to her, followed by two large dogs. She felt herself seized by a rough man's hand; she saw the angry face of the shepherd, and his stick was brandished close before her eyes.

"Your dog has dispersed my flock. I demand punishment and compensation."

Frightened and pale as death, Laura sought for her purse; she could scarcely find words to say, "I have no dog; let me go, good shepherd."

But the man shook her arm roughly. Two gigantic black beasts sprang upon her and snapped at her handkerchief.

"It is your dog; I know the red beast," cried the shepherd.

This was quite true, for Spitehahn had indeed observed the flock of sheep and devised his reckless plan. Suddenly, yelping hoarsely, he had sprung on a sheep and had bitten it severely in the leg. Then followed the flight of the flock, rushing together in a heap—Spitehahn in the midst of them, barking, scratching and biting—now along a dry ditch to the left, then down the slope to the wood into the thickest copse. At length he trotted home in safety, showing his teeth, and leaving his young lady to perish under the hand of the shepherd, who was still brandishing his stick over her.

"Let go of the young lady," called out the angry voice of a man. Fritz Hahn sprang forward, pushed

back the arm of the shepherd and caught Laura fainting in his arms.

The interposition of a third party drew from the shepherd new complaints, at the conclusion of which he again, in a flaming passion, tried to lay hold of the young lady, and was about to set his dogs at the Doctor. But Fritz, deeply roused, exclaimed, "Keep your dogs back, and behave yourself like a man, or I will have you punished. If a strange dog has injured your flock, adequate compensation shall be made. I am ready to be security to you or to the possessor of the sheep."

Thus he spoke, holding Laura firmly in his arms; her head lay upon his shoulders, and the red handkerchief hung over his waistcoat down to his breast. "Compose yourself, dear Fräulein," he said, with tender anxiety.

Laura raised her head and looked fearfully on the countenance which, excited with tenderness and sympathy, bent over her, and she perceived her situation with alarm. Fearful fate! he again for the third time the inevitable friend and preserver! She extricated herself from him, and said, in a faint voice, "I thank you, Doctor, I can walk alone now."

"No, I cannot leave you thus," cried Fritz, and again began to negotiate with the shepherd, who meanwhile had fetched the two victims of the murderous dog, and laid them down as proofs of the ill deed. Fritz put his hand into his pocket and handed the shepherd an installment of the money promised as compensation, gave him his name, and settled a future meeting with the man, who, after the appearance of the money, became more calm.

"I pray you take my arm," he said, turning chivalrously to Laura.

"I cannot accept that," replied the maiden, quite confused, and thinking of the existing hostility.

"It is only my duty as a man," said Fritz, soothingly. "You are too exhausted to go alone."

"Then I beg of you to take me to my godmother; she lives near here."

Fritz took the little basket from her, collected the fruit that had fallen out, and then conducted her to the village.

"I should not have been so much afraid of the man," said Laura, "but the black beasts were so fearful."

She took his arm hesitatingly; for now, when the fright had passed, she felt the painfulness of her situation, and alas! conscience-smitten. For she had early in the day thought the traveling toilet of the Doctor, as she saw him return home, unendurable; but Fritz was not a man who could long be considered unendurable. He was now full of tender feelings and care for her, endeavored to spare her every roughness on the road, stretching out his foot in going along to put the little

stones out of the way. He began an indifferent conversation about the godmother, which obliged her to talk, and brought other thoughts into her head. It happened besides, that he himself highly esteemed the godmother; indeed, she had once, when he was a school-boy, given him a cherry-cake and he had in return composed a poem on her birth-day. At the word poem Laura was astounded; in that house, too! Could they write poetry? But then the Doctor spoke very slightly of the elevating creations of happier hours, and when she asked him:

"Have you, indeed, written poetry?"

He answered, laughingly, "Only for home use, like every one."

Then she felt quite depressed by his cold disregard of poetry. There certainly was a difference between one style of verse and another; at Hahn's they only wrote about cherry-cakes. But immediately afterwards she blamed herself for her unbecoming thoughts towards her benefactor. So she turned in a friendly way to him and spoke of the pleasure she had taken just before in the squirrels of the wood. She had once bought one of a boy in the streets and had set it free, and the little animal had twice sprung from the trees upon her shoulders; and she had at last run away, with tears in her eyes, that it might remain in the woods. Now, when she saw a squirrel, it always appeared as if it belonged to her; and she undoubtedly deceived herself, but the squirrels seemed to be of the same opinion. This story led to the remarkable discovery that the Doctor had had a similar experience with a small owl, and he imitated the way in which the owl nodded its head when he brought in its food; and in doing so his spectacles looked so like owl's eyes that Laura could not help laughing.

Conversing in this way they arrived at the godmother's door. Fritz relinquished Laura's arm and wished to take leave. She remained standing on the threshold with her hand on the latch and said, in an embarrassed tone:

"Will you not come in at least for a moment, as you know my godmother?"

"With pleasure," replied the Doctor.

The godmother was sitting in her summer cottage, which was somewhat smaller, damper and less pleasant than her lodging in the town. When the children of the hostile houses entered together—first Laura, still pale and solemn; behind her the Doctor, with an equally serious countenance—the good lady was so astonished that she sat staring on the sofa and could only bring out the words:

"What do I see? Is it possible? You two children together!"

This exclamation dispelled the magic which for a moment had bound the young souls to each other.

Laura went coldly up to the godmother and related how the Doctor had accidentally come up at the time of her distress. But the Doctor explained that he had only wished to bring the young lady safely to her; then he inquired after the health of the godmother and took his leave.

While the godmother was applying restoratives and determining that Laura should return home another way under the care of her maid-servant, the Doctor went back with light steps to the wood. His frame of mind was entirely changed and a smile frequently passed over his countenance. The thought was constantly recurring to him how the maiden had rested in his arms. He had felt her bosom against his; her hair had touched his cheeks and he had gazed on her white neck. The worthy youth blushed at the thought and hastened his steps. In one thing at least the Professor was not wrong—a woman is, after all, very different from the ideal that a man derives from the study of human life and the history of the world. It certainly seemed to the Doctor now that there was something very attractive in waving locks, rosy cheeks and a beautiful form. He admitted that this discovery was not new, but he had not hitherto felt its value with such distinctness. It had been so touching when she recovered from her swoon, opened her eyes and withdrew herself bashfully from his arms; also his having defended her so valiantly filled him with cheerful pride. He stopped on the field of battle and laughed out heartily. Then he went along the same road which Laura had come from the wood; he looked along the ground as if he could discover the traces of her little feet upon the gravel, and he enjoyed the brightness and warmth of the air, the alluring song of the birds, the fluttering of the dragon-flies, with as light a heart as his pretty neighbor had done shortly before. Then the recollection of his friend came across him; he thought, with satisfaction, of the agitations of the Professor's mind and the commotion which Thusnelda had brought into it. The result had had a droll effect upon the Professor; his friend had been very comical in the pathos of his rising passion. Such a firm, earnest being contrasted curiously with the whimsical attacks which fate makes on the life of earth-born creatures. When he arrived at the last bush in which rustled one of the little grasshoppers, whose chirping he had often heard in times of anxiety, he spoke out gaily, "Even these must be at it; first the sheep, then the grasshoppers." He began singing half aloud a certain old song in which the grasshoppers were asked to go away and no longer to burden his spirit. Thus he returned home from his walk in right cheerful frame of mind, like a man of the world.

"Henry," began Frau Hummel, in the afternoon, solemnly to her husband, "compose yourself to listen to

a terrible story. I conjure you to remain calm and avoid a scene, and take pains to overcome your aversion; and, above all, consider our feelings."

She then related to him the misfortune that had occurred.

"As to the dog," replied Hummel, emphatically, "it has not been clearly shown that it was our dog. The testimony of the shepherd does not satisfy me; I know this fellow and require an impartial witness. There are so many strange dogs running about the city that the safety of the community is endangered, and I have often said it is a disgrace to our police. But if it should be our dog, I cannot see anything particularly wrong about it; if the sheep stretched out its leg to him and he bit it a little, that is its own affair and there is nothing to be said about it. As to what further concerns the shepherd, I know his master—so that is my affair. Finally, as regards the young man over there, it is your affair. I do not wish to visit on him the bad behavior of his parents, but I will have nothing to do with those people."

"I must call your attention to the fact, Hummel," interposed his wife, "that the Doctor has already paid money to the shepherd."

"Money for my child? That I cannot permit," exclaimed Hummel. "How much was it?"

"But father——" said Laura, imploringly.

"How can you expect," exclaimed Frau Hummel, reproachfully, "that your daughter, in danger of death, should count the groschens that her rescuer paid for her?"

"That's just like a woman," grumbled the master of the house; "you have no head for business; can you not incidentally ask him? The shepherd I take upon myself, and shall not trouble myself about the Doctor. Only this I tell you: the affair must be shortly settled and our relations with that house must remain as before. All I ask is to go on smoothly and I will take no notice of these Hahns."

After this decision he left the ladies to their feelings.

"Your father is right," said Frau Hummel, "to leave the principal matter to us; with his harsh disposition thanks would come very ungraciously."

"Mother," said Laura, entreatingly, "you have more tact; can you not go over there?"

"My child," answered Frau Hummel, clearing her throat, "that is not easy. This unfortunate occurrence of the dogs has left us women too much at variance. No, as you are the principal person now concerned, you must go over there yourself."

"I cannot visit the Doctor," exclaimed Laura, alarmed.

"That is not necessary," said Frau Hummel, soothingly. "There is one advantage in this neighborhood—that we see from our windows when the men go out;

then you shall rush over to the mother and address your thanks for the son to her. You are very judicious, my child, and will know how to act."

Thereupon Laura sat at the window, not well pleased to sit as watcher upon her neighbors; this lying in wait was repugnant to her. At last the Doctor appeared on the threshold; he looked the same as usual; there was nothing chivalrous to be seen in him; his figure was slender and he was of middle height—Laura liked tall people. He had an intellectual countenance, but it was concealed by his large spectacles, which gave him a pedantic appearance; when he did smile his face became quite handsome, but his usual serious expression was not becoming to him. Fritz disappeared round the corner and Laura put on her hat with a heavy heart and went into the hostile house, which she had never yet entered. Dorchon, who was not in the secret, looked astonished at the visit, but with quick intuition connected it with the return of the Doctor and announced, of her own accord, that neither of the gentlemen were at home, but that Frau Hahn was in the garden.

Frau Hahn was sitting in the Chinese temple. Both women stood opposite each other with a feeling of embarrassment; both thought at the same time of their last conversation and to both the recollection was painful. But with Frau Hahn the danger to which Laura had been exposed at once overcame this natural nervousness. "Ah, you poor young lady!" she began, but while overflowing with compassion, with delicate tact she drew away from the Chinese building, feeling that it was not an appropriate place for this visit and invited her to sit on a little bench in front of the white Muse. This was the pleasantest spot about the house; here the orange tree smiled upon its donor, and Laura could bring herself into a grateful mood. She told her neighbor how deeply she felt indebted to the Doctor, and she begged her to say this to her son, because she herself in the confusion had not properly fulfilled this duty. She then entered into the necessary business about the bad shepherd. Good Frau Hahn was pleased with her thanks and in a motherly way begged Laura to take off her hat for a little while, as it was warm in the garden. But Laura did not take off her hat. She expressed, in fitting terms, her pleasure in the garden, said how beautifully it bloomed, and heard with satisfaction of the splendid orange tree which had been sent anonymously to Herr Hahn, the fruit of which was sweet, for Herr Hahn had celebrated the return of his son by an artistic drink, for which he had taken the first fruit of the little tree.

It was altogether a diplomatic visit, not extended unnecessarily; and Laura was glad when, on departing, she had repeated her compliments and thanks to the Doctor.

In Laura's secret record also the events of this day were very shortly disposed of. Even an observation she had begun on the happiness of the lonely dwellers in the wood remained unfinished. How was it, Laura?—you, who write down everything; who, when an insect or a sparrow hops in at the window, burst forth into verse! Here was an event influencing your whole life—danger, unconsciousness in the arms of a stranger, who, in spite of his learned aspect, is a handsome youth! This would be the time to depict and indulge in fancy dreams. Capricious girl, why does this adventure lie like a dead stone in the fantastic landscape that surrounds thee? Is it with thee as with the traveler, who, weary of the Alpine scenery, looks below him and wonders that this marvelous nature so little impresses him, till gradually, but perhaps not for years, the scenes pursue him, waking or dreaming, and draw him anew to the mountains? Or has the nearness of the wicked beast who occasioned the outrage impeded the flight of your soaring wings? There he lies before your threshold, red and ragged, and licks his moustache.

(To be continued.)

## The Open Court

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT. DR. PAUL CARUS, EDITOR.

THE OPEN COURT is devoted to the work of reconciling Religion with Science. The founder and editor have found this conciliation in Monism—to present and defend which is the main object of THE OPEN COURT.

THE OPEN COURT has for contributors the leading thinkers of the old and new world.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social and economic questions.

TERMS, \$3.00 PER YEAR. SINGLE COPIES, 10 CTS.

All communications should be addressed to

## THE ORIGIN OF REASON.

BY LUDWIG NOIRÉ.

*Translated from the German in the Gegenwart by JUPON.*

If I were to tell a man who had never seen ice and was wondering what had happened to a lake in winter, "The water is frozen," this would be an explanation. This explanation contains two elements, viz.:

(1.) A *sound*, which certainly cannot contribute in the least to the explication of the matter.

(2.) A *concept*, which in its accurate acceptance likewise implies no more than the phenomenon itself, as present before us and as perceived by us.

Why is this simple statement then accepted as satisfactory? Here is a difficult question, and it may not be answered without a consideration of the nature and origin of reason. Locke has dealt with the problem and deduced from it the uncertainty and mere seemingness of most human knowledge.

The distinctive feature of my answer to the man is that the phenomenon is generalized by the concept "frozen" or, more correctly, included under a general definition.

Concepts are generalizations and it is these generalized concepts that constitute the substance of human knowledge.

When it is real cold, all living creatures feel it. But only the human being can say: "I am cold." A man can say this on a hot summer's day, he can think it, even when not affected by it. Why? Because he possesses general concepts.

And how has he come to possess them? This is the most perplexing of the questions that touch humanity, for it touches the *origin of reason* and reason is man.

If I should say: "Man thinks because he speaks: he has general concepts because he has words," I know that nine-tenths of my readers would shake their heads and say: "No. Man speaks because he thinks." All great truths are known first as paradoxes, and a long time elapses before people become accustomed to them, before they leave the old way of thinking and accommodate themselves to the new. How long it was before men would distrust their eyes, and believe that it was the earth that revolved and not the sun!

Words are the fixed points which define the limits of the concepts they have brought into existence. Without words there would be only fleeting, shadowy and

disorderly impressions. An idea has never existed in man without its material counterpart, the word. And yet, I do not say that with every word as a sound there must be an accompanying idea. Parrots imitate our words, yet produce only sounds; to them they are sounds and nothing else, just as the words of an unknown tongue are mere sounds to us. The sound is dead, the word is alive and the life of a word is in the idea.

The great problem is, how ideas are united with sounds and thus made alive. This question has engaged the attention of philosophers of all ages, while great acumen and imaginative talent have been exercised in its solution. System upon system arose wherein fancy and imagination were given full scope, and I firmly believe there is no topic upon which so great a variety of opinions has been expressed and so many treatises written as upon the origin of language. It was intuitively felt that this was the point to place the lever, and that, if their efforts to move the rock which buried the secret would be successful, a fountain of everlasting and living truth would leap forth to clarify the province of human thought and human activity.

Yet, to reach this point, the flights of fancy were first to be restrained. This was accomplished by comparative philology. Its cardinal and motive principle was: There is a methodical, a scientific line of investigation which will lead to this secret and its elucidation. Critical thought and not dogmatic doctrine must guide us here, and careful investigations of empirical facts are to form the basis of all our conclusions. Whatever the ultimate result of our efforts may be, it is not permissible to determine it beforehand and employ it hypothetically, be its merits what they may. Modern science has materially modified the ideas of former times. The interest which, from the time of Plato to the eighteenth century, fettered philosophical thought to such topics as these, has been displaced by new interests of a totally different character. How radical these changes have been needs no better illustration than the fact that the *Société de Linguistique* in Paris, ranking among its members the foremost philologists of France, declares in one of the first clauses of its constitution, "it will accept no manner of contribution relating to the origin of language or the construction of a universal tongue."\*

\*Max Müller, in a lecture delivered before the University of Cambridge, May 28, 1868.

Thereafter imaginative works ceased to figure in this realm. This was necessary and beneficent if we consider what they had achieved. Yet philosophy, too, was banished from the province of philological investigation—a province in which philosophy is ordained to act a vital part—and this was unwise.

For what else is philosophy than the discovering of comprehensive and general points of view in *all* sciences? It is not the empirical material gathered together, it is the wonderful power of thought that has raised Copernicus, Galileo, Kepler and Newton to the rank of heroes in Natural Science.

With that interdict the question of the origin of language was banished from its natural and true sphere. The question was occasionally touched upon by the physiological and evolutionary theories of Helmholtz, Darwin, Broca and Kussmaul, and at times was discussed in the empty phraseology of a degenerate pseudo-philosophy.

It would have been, in my estimation, more worthy of a philological society that included the master-minds of science, to have said: "No philosophy has the right to advance an opinion upon the origin of reason, the nature of thought—its highest problems—without having first recognized and taken cognizance of the results of comparative philology; for language is the body of thought and both came into being together." Instead of this, the society divorced philosophy from philology, and said: "Look about thee for another source of information on the origin of language; there is nothing known of it here and we shall not trouble ourselves further about subjects that lie beyond our jurisdiction." Thus disowned, philosophy asked: "At least tell me of the nature of human speech and wherein it differs from that of animals, with which it is so commonly compared. I must have some principle to guide me in my speculative peregrinations." "No information on that point either; that's not within our province. Thou shalt find what thou wantst in Brehm's *Animal Life*; he has drawn up the complete vocabulary of a singularly clever parrot. That will show thee how far the linguistic power of an animal goes." Thus the philologists said: and no less a considerable man than Friedrich Müller takes compassionate leave in these words: "The difference between the language of man and that of brute creation is quantitative and not qualitative."

This certainly simplifies the matter greatly, for it thus becomes a question of mere calculation. Brehm's "singularly clever" parrot, that Mezzofanti of brute creation, could use in the neighborhood of 150 words with intelligent discrimination; on the other hand the total vocabulary of English miners in certain districts counts but 300. It is now plain how many words the parrot will have to learn to arrive at that stage of intelligence the English miner has attained and thus be able

to verify his claim to universal suffrage. It would be a great step forward for all parrots, and they could at once politely request that the nonsensical prattlers of their human kindred should not be honored with their name.

But levity aside. In order that the reader may profit by this discussion, I propose to specify an infallible criterion which will, in every case, enable him to avoid confusion when oracular wisdom speaks of the identity or analogy of human and animal speech.

One hundred years ago (1881) a plain and simple man, Immanuel Kant, gave the world a commonplace looking book. It was printed on gray paper, was highly inaccurate and bore the strange title: *Critique of Pure Reason*. This book had manifold and important consequences, which cannot be enumerated here. One of them which is perhaps best known is that Berlin, after Hegel, derived from this book its name the "*City of Pure Reason*."

We may read to-day in the aforesaid book (Johann Friedrich Hartknoch published it at Riga) all manner of strange and useful things, as, for example: That the whole business of the human reason is with representations (not with mere sensations) and that these representations arranged, co-ordinated and moulded by concepts, become objects which are the only true content of all our rational thinking, and that our thought therefore assumes an objective character throughout. And it follows thence that if we deviate from the paths of empirical cognition, we shall lose ourselves in hallucinations, extravagances and in the mazes of a cognitive activity that has overstepped its true limits.

Representations and objects then which are given by the senses, but are moulded and formed by reason and stamped by concepts! Now we may reveal to the reader the promised secret. It is this: Every word in human speech had, originally, reference to an object which was signified by a word, and words have, at the very start, first received meaning and intelligibility from these representations.

Let us return to the example given at the start. "The water is frozen" and "I am freezing." Should the question be put to the reader how the concept and word "freezing" have arisen, the chances are a thousand to one that he will launch into one of the current theories as to the origin of language and answer, "From a sensation, of course!" Freezing, shivering and chattering with the teeth was the original symptom. You can hear it plainly in the word freeze, frost, *frigus*, *froid*! What a chill runs over one when it is mentioned! It stands to reason that people should personify other things, such as plants and water, and say of them, they freeze, they are frozen. Is not man the "measure of all things" according to Protagoras, and does not man imprint his own being on every other existing thing?

And yet, how so easy, natural and reasonable this all sounds, it is positively wrong. According to the revelations of Kant it is not possible that the sensation of freezing has become a concept and a word otherwise than through the long and round-about way of representations of external objects and thus frozen (*frigus*, *ψυχρ*, *ψύω*) water must have found a lingual or (what is the same thing) a rational designation long before; and without such designation or an analogous form of concept the sensation could never have found expression or association whatever.

This follows unavoidably from the doctrine of Kant. And strange! Comparative philology, without knowing or dreaming of Kant, has fully established this origin and natural growth of concepts after its own fashion and by its own empirical methods.

Yet, instead of being converted by this great and marvelous coincidence to the belief of the great genius that had divined these results with prophetic glance, it still continues to reject the aid of philosophy, even in those depths where empiricism cannot penetrate, and places its sole dependence upon instruments that the hard and rocky soil defies. Far from following the path of science it seems to have devoted itself to fumbling and groping about in regions of darkness, whence only the light of philosophy can be its guide and illuminate its path to further empiric investigation.

Thus it is that comparative philology has yet to learn from Kant, if it will ever keep in view the true purpose of its mission, "the history of the human mind."

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M. D.

Part IV.

DIET.

The intimate interaction of body and mind is most strikingly illustrated in the moral influence of diet. Modern science has revealed the fact that the various ingredients of the fuel feeding the fire of a conflagration can be tested by the spectrum-lines of the flame, and with the same certainty a searching analysis could trace every change of diet to its effect in a modification of our mental disposition. "*Der Mensch ist, was er isst*," says a German proverb; "Man is what he eats." The maxims of dietetic hygiene thus gain a moral significance, a fact recognized in the principle of the temperance movement, and, indeed, in the ethics of all health-loving nations.

But the delusions of the dualism which contrasted a supernatural spirit-world to the phenomena of the material universe, led to the equally baneful belief in the immaterial and self-dependent nature of the human soul. The "immortal mind" was long considered a

mere guest of its earthly tabernacle, the despised body which might temporarily limit the freedom of its tenants, but could not affect them by its decay and might eventually be cast off:

"—As a garment, no more fitting,  
As a house which I am quitting,  
As a cage, from which at last,  
Like a bird my soul has passed."

That poetic but sadly erroneous theory biased the ethics of many of the greatest ancient and mediæval moralists, and it is a most suggestive fact that the predominance of their dualism is always reflected in the degree of their indifference to that chief basis of physical welfare: a wholesome diet. Mosaism, with all its hierarchic tendencies, is, after all, a manful, earth-loving and nature-abiding creed, and the persistent inculcation of dietetic health-laws harmonizes with its equally persistent silence on the metaphysical vagaries of resurrection and other-worldly punishments and rewards. The ethics of Socrates, on the other hand, seem to have anticipated many tenets of the neo-platonic school, and at the banquets of Agathon, in the midst of his table-talk lectures on the immortality of the soul, he quaffs cup after cup of alcoholic beverages as calmly as he afterward drained the poison-chalice of the oligarch. The Gnostics boasted their disregard of all non-spiritual concerns, and among the followers of the world-renouncing Messiah that spiritism assumed the form of an absolute indifference to the welfare of the earthly body. The health code of the Hebrew law-giver was revoked; the authorities of the Patristic era gloried in an ultra-cynical neglect of dietetic cleanliness, or even deliberately tainted their food with bitter and loathsome admixtures to mortify the natural cravings of the palate. During the middle ages, too, the dietetic purism, which an amplification of the Mosaic code had enforced upon the disciples of Islam, contrasted strangely with the habits of their western neighbors, who scouted the interdiction of pork and wine, quoting the words of their master, that no man can be defiled by things that enter his mouth.

That mistake avenged itself in the ravages of scrofula and alcoholism, but even in that age of dietetic aberrations, the consequences of *quantitative* excesses were too striking to be entirely ignored. In the popular dramas of the middle ages the crapulent monks often seem to parody their own foibles, and the fact that repletion is apt to induce mental indolence ("*plenus venter non studet libenter*") assumed its proverbial form in the convent schools of southern Germany. The moral influence of habitual surfeits contrasts, indeed, most suggestively with the effect of abstemious habits. Gluttony torpifies the mental faculties. The "after-dinner lassitude" finds its physiological explanation in the circumstance that the work of digestion monop-

\*Copyrighted.

olizes the energies of the organism and that transient torpor may become a chronic aversion to mental efforts. The *bonhomie* of epicures can be traced to a similar cause. Yielding in argument is easier than controversy; the indulgence of a generous impulse is more pleasant than its suppression, and the liberality associated with the after-effect of a full meal may be founded on indolence as much as on philanthropic principles, plethoric gluttons being notoriously subject to fits of brutal passion. The same gourmand, who, in the enjoyment of his siesta, will grant the request of an insolent petitioner to obviate the annoyance of further importunities, may, before night, kick his wife and half kill his child for a trifling offense. The irascible temper of Squire Potbelly may have a purely physical cause: the irritating influence of vitiated humors; but, as usual, such physical predispositions are associated with their moral correlatives: Pessimism, world-weariness and the *laus temporis acti*, a mania for the depreciation of contemporary tendencies. I knew an old farmer whose frequent fits of indigestion never failed to explode in raging diatribes on the wickedness and incapacity of the rising generation. Under the influence of a similar distemper, the father of Frederick the Great used to lecture his household on the decadence of Christian ethics, and finish his homily by beating his son black and blue. Walter Savage Landor, who could sacrifice a night's rest to the elaboration of a sentimental sonnet, was none the less prone to paroxysms of after-dinner wrath. During his struggles with the gastric consequences of an eel pie, his servants would flee as from the presence of a madman, and the citizens of Florence preserve a tradition that the discovery of a neglected pot-flower once impelled him to fling his valet from a third story window. The eupeptic prelates of the middle ages were often afflicted with decidedly unchristian tempers, and in their controversies were notoriously apt to answer arguments with personal insults.

Habitual gluttons are not often great thinkers, but it cannot be denied that, under the stimulus of an urgent motive, they have proved themselves capable of heroic physical efforts. Thus the sluggish boar, at the approach of his foes, will rouse himself from his torpor of surfeit and rout hounds and hunters by the desperate energy of his onset. Marshal Vendome, the great strategist, was also the greatest glutton of his century. He would devour his favorite viands with snap-bites, like a famished wolf, often correcting a slip of the fork by snatching up a tempting morsel with his fingers, and thus gorge himself till the expansion of his paunch threatened him with suffocation; yet, on the morrow of such surfeits, the arrival of a scout or a glimpse of the hostile vanguard would transform him into a warrior of the old Roman type. His ablest opponents were baffled by the skill and rapidity of his tactics, and after

a disastrous rout caused by the incapacity of an associate commander, the French army was twice saved by the superhuman efforts of the old cormorant. His energy compelled the surrender of Spanish insurgents who had worn out the armies of their own king, as they afterwards exhausted the resources of the French Empire; but after an ovation resembling the triumph of a Roman conqueror, the otherwise invincible veteran proceeded to indemnify himself for the privations of his campaign by engaging a staff of pastry-cooks and retiring to a Spanish country-seat, where he managed to gorge out his life in a single week. Milo of Crotona, the Sicilian Samson, was as much admired for the vigor of his digestive organs as for the fervor of his patriotism and the matchless prowess of his fists. In the war against Sybaris he marched at the head of his fellow-citizens, flaunting a lion-skin and a huge club; and once saved a synod of Pythagorean philosophers by using his arms to prop the pillars of a falling temple. He was an orator and a peerless athlete, but every now and then proved the versatility of his talents by an eating-match, and after defeating the best boxers of an international field day and carrying a young bull around the entire circuit of the arena, he crowned his exploits by roasting that bull and devouring the beef at a single meal—let us hope with the assistance of his bottle-holders. Our Saxon ancestors, too, were inclined to make gastric capacity a test of constitutional vigor. A feeble stomach was apt to qualify the prestige of a popular hero, and on his visit to Joetunheim, Thor himself defies the giant-king to produce his champion eaters and drinkers. King Attila, however, punished voracity as a breach of discipline, and Peter Bayle perhaps justly expresses his surprise that so many of the nations who enacted severe sumptuary laws against drunkenness should have considered gluttony a venial sin.

Gluttony tends to cynicism. Coarseness and extravagance of speech and manners go hand in hand with dietetic excesses, as for cognate reasons, the repulsiveness of voracious animals is generally aggravated by a want of cleanliness. Among the natives of the Arctic regions, where climatic causes make gluttony a pandemic vice, personal cleanliness is an almost unknown virtue, and Kane's anecdotes of polar household-habits depict a degree of squalor that would appal a gorilla. "Our poverty, but not our will consents," is a plea that could hardly be urged in behalf of the amateur-cynics developed in the mediæval strongholds of gormandage, and the *ne plus ultra* of reckless obscenity is not to be found in the satires of Petronius Arbiter, but in the dissertations of the Spanish monk-moralist Sanchez.

Habitual abstemiousness, on the other hand, is the concomitant of modesty, thrift, self-control and evenness of temper, and is compatible with heroic perseverance, though hardly with great energy of vital vigor.

The dietetic self-denials of Luigi Cornaro, a Venetian nobleman of the sixteenth century, enabled him to outlive the third generation of his epicurean relatives. During the latter decades of his long life he boasts of having enjoyed a peace of mind unattainable by other means, and one of his biographers admits that the impulse of wrath seemed to have become extinct in his soul, but remarks that the friends of the noble ascetic complained of a certain reserve and pedantry, quite foreign to his character during the period preceding his change of habits. He also became a poetaster, and only the urgent protests of an influential relative prevented him from publishing the inspirations of his mystic muse. St. Francis, during his latter years of penance, evinced a similar penchant, and the premature publication of his odes might have imperiled his chances of canonization in that age of classic revivals. A love of romance and mystery, with a distinct leaning towards the more extravagant forms of miraculism, is, indeed, an international characteristic of the abstemious East. Persia and the eastern provinces of the Caliphs, could boast of many poets, but only of few prominent philosophers, or inventors; natural science is an exotic plant in the soil of China and Japan, and the prodigious literature of ancient India is almost limited to spiritual extravagances. That poetical penchant is sometimes strangely associated with a pedantic conservatism of manners and opinion. All Asia is rite-ridden; the mystic-romantic Spaniard wears a practical stranger with an ultra-prosaic observance of meaningless formalities. Intellectual *asthenia*, however, is the common root of mysticism and ceremonialism.

Habitual abstinence, carried to ascetic extremes, is apt to result in spiritualistic aberrations. "Fast in the wilderness and you will see ghosts," says an Indian proverb, confirmed by the visions of millions of mediæval fanatics, who tried to exalt their souls by starving their bodies, and got their reward in the phantasmagoria of inanition. Under the influence of protracted starvation, the organism preys on its own tissues, and the degeneration of cerebral substance may partly account for the literary exploits of ecstatic nuns and apocalyptic hermits.

Within the bounds of reason, occasional fasts, however, are by no means incompatible with intellectual vigor, though they are chiefly apt to stimulate the activity of abstruse speculations. There are intellectual voluptuaries whose enjoyment of mental triumphs in controversy or cogitation seem, for the time being, actually to deaden their craving for material food. Isaac Newton, on the track of a cosmic secret, would send back plate after plate of untasted meals. Percy Shelley, in the words of his sprightly biographer, "indignantly refused to alloy the nectar of poetic inspiration with boarding-house soup," and in his creative moods rarely answered

a dinner-call without a sigh of regret. Benedict Spinoza, amidst the parchment piles of his bachelor-den, would fast for days in the ecstasy of his "*Gott trunk-enen*"—"God intoxicated"—meditations. Intermittent denutrition undoubtedly tends to clear off the cobwebs of the brain. The ancient custom of postponing the principal meal to the end of the day was perhaps propitious to mental lucidity; and Goethe, whose abhorrence of mediæval dissertations was modified by his partiality for the writings of Spinoza, testifies that the *Ethics* of the great pantheist, like the masterpieces of classic literature, cheered him "with a feeling akin to the pleasant impression experienced on entering a well lighted room."

Rare and enforced fasts, however, are apt to exercise an unfavorable influence on the temper of the patient. The captives of our menagerie cages submit in sullen silence to untold vexations, but a brief postponement of the dinner hour turns the whole circus into a pandemonium of grunts and shrieks. The querulous mood of an orthodox Mussulman during the observance of the yearly Rhamadan fast is equaled only by his exuberance of good humor at the conclusion of the penance. Sailors, who endure without a murmur the extremes of atmospheric hardships, are apt to rebel against the first attempt at dietary restrictions, and the report of a recent committee of investigation admits that the shortcomings of unprofessional cooks are among the most fruitful causes of desertions from the military service of the United States. Napoleon the Great personally supervised every detail of his commissary system, and the war-correspondent of the *London Times* justly predicted that the dietetic bereavements of the Crimean troops would cost the Government service a loss of popularity too great to be retrieved by a dozen victories.

For those very reasons, perhaps, the founders of ancient religions prescribed fasts as a crucial test of subordination, a test which our latter-day prophets hesitate to apply, and which indeed, in the popular form of its observance, has almost lost its afflictive significance. Father de Smet tells an anecdote of a converted tribe of Dakota redskins who patiently masticated their dry bull-beef for six days in the week, but devoted their Fridays to a festive re-union, culminating in an uproarious barbecue of maple-um and broiled mountain-trout. The *bona-fide* fasts of Islam, on the other hand, have seriously impeded the progress of its propaganda among the eupeptic tribes of the north.

Actual starvation exasperates, but eventually unmans, the sufferer. The pangs of hunger may excite a transient disposition to violent deeds of self-help, but in the course of time lead to more lasting results; and it is a most instructive, though melancholy, fact that under the purely physical influence of protracted famine, nearly all the distinctively human attributes have been

crushed out of many once noble nations: The sense of honor, patriotism, the instinct of beauty, and finally even the instinct of industry and the love of knowledge.

Pugnacity, the love of mirth and the instinct of friendship, however, stand their ground to the last, and like the social instinct, seem to have acquired their deep-rooted hold during the ages preceding the advance from the anthropoid stage of human development.

(To be continued.)

#### MONISM AND PHILOLOGY.

While during the last century all the natural sciences have made many wonderful discoveries, philology has not remained behind in contributing its share to the general work of progress. Through the efforts of the Grimm brothers the study of the languages became a comparative philology, which stated the laws of the growth of speech. Comparative philology found the key to a correct understanding of the Aryan languages in the study of Sanskrit,\* and new light poured in, by which the solution of many an obscure problem could be hoped for.

The study of language became a philosophy of language, and this philosophy corroborated the truth of Monism, which was recognized more and more in all the different sciences as the only consistent conception of the world.

One of the most prominent scholars in this domain is Max Müller. He was one of the first philologists to scientifically investigate Sanskrit. His discoveries in comparative philology are generally recognized, and his merits in the philosophy of language will never be forgotten. By digging down to the philosophy of language he discovered the foundation of human nature and its characteristics, for he proved that the origin of language and the origin of reason are one and the same problem.

Max Müller's theory of the identity of language and thought found much opposition, partly because his definition of thought was not accepted, partly because the problem which was at issue was not understood. The problem was correctly stated by Noiré as "The Origin of Reason." Reason was generally supposed to be a creative power, a divine mysterious something which produced thought, language, science and art. The mystery of reason, however, can easily be explained, for the origin of reason is a very simple mechanical process; it is identical with that of language. The expression of man's feelings in words constitutes his thought. Without words no thoughts. Sounds are the best adapted mechanical means for the formation of

language, and thus the formation of speech is the mechanism which produces reason.

The problem was not to find the similarity of animal language and human language, of animal thought and human thought, of animal reason and human reason, but their difference. To find similarities is the first duty of the philosopher and investigator. The second duty of the scholar and scientist is to discriminate, and to discriminate is, in most cases, much more difficult than to find similarities. If we see differences we can appreciate similarities better and will be guarded against taking them as identities.

The merit of this discrimination is Max Müller's work, and all his books contain explanations and corollaries of his leading idea, that man *thinks* because he *speaks*.

Noiré has published a book (*Max Müller and the Philosophy of Language*. London: Longmans, Green & Co.) of which he says in an introductory note:

"In my book on 'The Origin of Language,' before proposing my own solution of the great problem, I endeavor to trace its historical development from the earliest times down to those latest achievements of scientific research upon which my own theory is founded, and without which, indeed, its conception would have been impossible.

"In this summary, as I have since become aware, I was far from doing justice to the great merits of Max Müller and the researches by which he has cleared the way for future investigators. And it was to rectify this error that I hastened to publish in a German review, *Nord und Süd*, an article in which, to the best of my judgment and belief, the *sum cuique* was more equally apportioned.

"The serious importance and wide bearings of the subject have induced me to make this article, in an enlarged form, accessible to the English reader."

In this work Noiré shows in the first two chapters Max Müller's attitude in relation to the theory of development and to Darwinism in particular. Max Müller, who has, even in advance of Darwin, taught the doctrine of evolution, severs himself from the followers of Darwin and begins a critical attack, when, overlooking or dismissing off-hand man's real characteristic, reason and speech, they treat external causes and structural transitions as a sufficient scientific explanation of the greatest marvel of creation.

We excerpt from Noiré's book the most important passages. He says: "Reason, or the mental life of man, constitutes a new, specific distinction, without an exact parallel in any other part of nature, a differentiation which we must seek to derive from more general natural causes. \* \* \*

"The inner organic tissue, the means whereby the functions of reason are accomplished, is afforded by

\* In consideration of the importance of Sanskrit, which has been so helpful to establish the monistic view in the domain of philology, we shall publish in future issues of THE OPEN COURT a series of essays by Oldenberg, the well-known Sanskrit scholar, author of "The Life of Buddha," etc.

those mysterious entities which are called *concepts, conceptions, notions*, or, in Platonic phrase, *ideas*. They are the exclusive property of man. \* \* \*

"Concepts cannot be formed without the help of words. The sound, the word, is the body of the concept. Both are designated in Greek by the single word *logos*, which means 'word and reason.' \* \* The two *ratio* and *oratio* are one and the same, only conceived from different points of view; the one is the inner and spiritual, the other the outer and corporeal side. \* \*

"As formerly, Spinoza's great disciple, Goethe, formulated the fundamental monistic doctrine in the simple words, as indubitable as unambiguous: 'No mind without matter, no matter without mind,' so Max Müller with equal clearness and confidence: 'Without speech no reason, without reason no speech.' \* \* \*

"The debates as to whether thought and reason shall be ascribed to animals, to babies and to untaught deaf-mutes are merely verbal disputes and proceed from the fact that the words used have not had associated with them the clear and definite matter of conception which belongs to them, but are employed in a general, vague and misty fashion.

"A child knows as certainly before it can speak, the difference between sweet and bitter [i. e., that sweet is not bitter], as it knows afterwards (when it comes to speak) that wormwood and sugar-plums are not the same thing. A child receives the sensation of sweetness; he enjoys it, he recollects it, he desires it again, but he does not know what sweet is; he is absorbed in its sensations, its pleasures, its recollections; he cannot look at them from above, he cannot reason on them, he cannot tell of them."

"Similarly, Lazarus Geiger says: 'It is easy to see that blood is red and milk is white; but to abstract the redness of blood from the collective impression, to find the same notion again in a red berry, and, in spite of its other differences, to include under the same head the red berry and the red blood—or the white milk and the white snow—this is something altogether different. No animal does this, *for this, and this only, is thinking.*'

\* \* \* \* \*

"The power of abstraction, or having general ideas, Max Müller declares, is realized by means of language and language only, which is the exclusive property of mankind, in virtue of its humanity. That which is language seen from without is reason seen from within. It is the obvious mark of distinction between man and beast. The origin of human development can therefore only be elucidated by the discovery of the origin of language. And if we ask what new contributions have been brought to light from the material hitherto examined by comparative philology, in aid of this enquiry, 'The result,' says our author, 'if we look back on our former lecture, is this: After we had explained every-

thing in the growth of language that can be explained, there remained in the end, as the only inexplicable residuum, what we called *roots*. \* \* \* What, then, are these roots? In our modern languages roots can only be discovered by scientific analysis, and, even as far back as Sanskrit, we may say that no root was ever used as a noun or as a verb. But originally roots were thus used, and in Chinese we have fortunately preserved to us a representative of that primitive radical stage which, like the granite, underlies all other strata of human speech. Roots, therefore, are not, as is commonly maintained, merely scientific abstractions, but they were used originally as real words."

"What we want to find out is this: *What inward mental phase is it that corresponds to these roots as the germ of human speech?*"

Noiré calls the roots the linguistic germ cells, or *Ova*. *Omne vivum ex ovo*, all growth of language springs from these roots. "By their development and uninterrupted growth all the known languages of the world have reached their marvelous stature and become the body of reason and instrument of mind. By the help of these roots and their intellectual equivalent man has taken spiritual possession of the whole creation, as he, at the same moment, cast it in their mould and stamped it with their impress." \* \* \*

Max Müller rejects the theory of onomatopoeia as well as the interjectional theory. He ironically calls one the Bow-wow, the other the Pooh-pooh theory. He says in his "Ursprung der Sprache": "In the nature of the mind, as well as that of the body, there is no *saltus*; the one is developed out of as minute elements as the other." \* \* \* The inferences which Max Müller deduced from this important elementary truth are, in their main features, as follows:

"1. The sounds of language are at all times and everywhere significant. It is in virtue of this quality alone that they form a part of speech. The interjectional and imitative theories are herewith condemned.

"2. Nothing in language is dead that has not once been alive. This explains and sets aside the apparent exceptions presented by inflection-terminations, infixes, affixes and the whole formal apparatus of language. The word *fruchtbar* could not be formed unless the second syllable had a meaning, and though that meaning is lost to the feeling of contemporary speech, science shows us that it originally meant fruit-bearing.

"3. Language passed from the simplest beginnings—monosyllabic, primary roots—first to secondary and tertiary roots and then, through the luxuriant abundance of forms belonging to the polysynthetic or agglutinative stage, to the clearness and precision, to the wonderful richness of thought and expression belonging to modern and inflected languages. The cradle of speech is the goal of the science of language.

"4. The mental counterpart of roots are certain fixed rational elements, nearly all of the nature of *predicates*, though a few, the pronominal class, are *demonstrative*. And as the roots, considered as sounds, are phonetic types, so their rational counterparts in the mind are rational types; those are phonetical types, these conceptual types or rational concepts. These, we repeat, are the fixed forms or norms with which language, that is to say, rational thought, has stamped as its own the whole of creation.

"5. The original mental content of the roots, their earliest meanings, so far as comparative philology can trace them, prove to have been only sensible perceptions or impressions."

Noiré fully concurs with Max Müller, but he adds: "While all preceding writers on the philosophy of language, Max Müller and Geiger included, have followed the universal tradition in deriving language and thought from the passive element of PERCEPTION, I have entered upon the opposite course and affirm:

"Language is the child of will, of an active, not of a passive, state; the roots of words contain the *proper activity of men* and receives their significance from the *effects* of this activity in so far as it is phenomenal, i.e., visible. Human thought arises from a double root, the subjective activity, or the will, and the objective phenomenon which is accessible to the senses."

Max Müller has since expressed his full assent to Noiré's view.

#### THE DEVELOPMENT OF GENIUS.\*

BY LUCIEN ARRÉAT.

Monsieur Ch. Richet does not doubt that our "nervous psychic system" has the power of indefinitely preserving the memory of the shocks which it receives, and he writes:

"We can found great hopes upon the future of human intelligence. It seems that the concentrative power of the mind increases in proportion to the amount of knowledge. The activity of a muscle is increased by exercise, and the power thus accumulated is transmitted from generation to generation. In the same manner, undoubtedly, the power of memory is strengthened by exercise, and this increase may be transmitted by heredity."

This assurance is quite necessary, for the chamber already filled by our brains seems too small to be able to contain our new riches. One special study suffices, at this day, to occupy the entire life of man. He who prides himself on being a philosopher, cannot at the same time be a specialist. The generalities which he must know require the assistance of such a number of facts, and the study of psychology, particularly, involves the necessity for such an unlimited number of data, that

even for the most vigorous intellect a powerful memory has become indispensable to good work.

The Greek Dioscorides, who lived four hundred years after Theophrastus, mentions in his works only six hundred plants, and Laurent de Jussieu has defined a hundred families. It would seem then that the brain of a De Jussieu must have contained a greater number of images or representations than did that of a Dioscorides, and the brain of a Cuvier more than even that of Aristotle.

It is true that the scientists, and, above all, the classifiers of the present day, work a great deal with the pen; that they possess the "paper-memory" of which Montaigne speaks; that they employ general formulæ and abbreviate them, and this fact already would forbid our deciding whether the mental capacity of the moderns is really superior to that of the ancients. We would have to measure the crania and weigh the brains before we could decide this question.

Nevertheless, the moderns, if they lack quantity in representation, oftentimes possess the advantage of quality. The most learned doctors of ancient Sorbonne had their heads crowded with facts of no real value whatever, and the metaphor could be applied to them that "the most precious jewels are found in the smallest caskets." Our earliest notions in the brain are like centers of production, and the false ideas as well as the chimære of rational frivolity generate a pathological condition which invades and finally destroys the organ of thought, while genuine information and true ideas infinitely strengthen it.

I have not sufficiently studied the gift of genius to speak of it with perfect knowledge. I shall nevertheless be obliged to explain its final ruin by the diseased growth of certain germs, whose monstrous vegetation chokes in its most beautiful hour of bloom the philosophy, the poetry, and the art of genius.

But the quantity of facts which are in the brain only aid genius; they do not constitute it. That which distinguishes genius is a rare activity and a marvelous power of discovering relations between facts hitherto unperceived and the knowledge of which is most fertile in new thoughts and sentiments in the domain of science or in that of art. The increase of a knowledge of facts does not, then, necessarily indicate a growth of scientific genius, and the diminution of egoism does not necessarily entail an increase of morality.

If we abandon egoism by attaching our interest to something else than ourselves, the number of the external objects is of scarcely any importance, and the extension of our sympathies to larger groups does not give us the exact measure of our moral progress. A fine German thinker, who is of French descent on his father's side, Mr. Julius Duboc, has made this remark. I would only like to complete his thought by distinguishing between our ability and its effects.

\*Translated from the French in *Journal d'un Philosophe*.

In the domain of art, the man of Vézère who engraved and so finely retouched the profile of the head of a mammoth on an ivory *plaque*, which is now in the museum, was a pre-historic Phidias, for in art the social conditions are most influential.

In the intellectual domain, the progress is evident, judging by the results and the accumulation of discoveries; but we cannot so plainly see that Newton was superior to Archimedes, and a savage Archimedes would limit the use of his genius to discovering the manner of cutting stone or of shaping flint.

Neither does our power seem to have increased materially in the domain of morals: I mean the power to accomplish a sacrifice commanded by duty; but the sacrifice has in a great many cases become easier, perhaps more habitual, and it seems that the sail of our will spreads itself of its own accord to the good wind.

If, now, the Greeks have originated abstract science, which the Chinese, for instance, could not do, it is because they were endowed with greater genius, and an opinion based upon the appearance of the races forces us to admit at least some degrees of difference in their intellectual power. We must admit it in their artistic faculty and in their moral faculty, and then we could say that the power increases in man, but infinitely less quickly than the effects of this power multiply.

The doctrine of indefinite progress in our species, which appeared to be included in Monsieur Richet's thesis, could not be accepted without a correction as regards the perfectibility of individuals. The growth of the "retentive" faculty, it is asserted by this eminent scientist, does not mean the same as the growth of the rational faculty, and we may accordingly hold to the conviction that genius will continue to exist in humanity without necessarily insisting upon its eventual expansion.

#### DETERMINISM AND FREE WILL.

Two views have ever stood opposed to each other in the realm of religious and philosophical questions, the one claiming absolute determinism as a matter of course for all phenomena of nature and life, human actions not excluded; the other maintaining that whatever be the claim of determinism in the province of physical science man's actions are *not* determined, for man is endowed with free will. The former opinion is generally considered as the scientific view; the latter as the moral or religious aspect.

It is apparent that the very existence of morals and religion depend upon man's having a free will, and at the same time determinism full and unrestricted without any exceptions is the condition, the *sine qua non* of science. Prof. James, in his reply to Prof. Giżycki's essay, reveals to us the basis upon which all dualism and with it indeterminism stands; it is the *ought* in our breasts, it is our moral consciousness which we gladly

confess, it is an undeniable fact. And this *ought*, or as the great sage of Königsberg calls it, the categorical imperative in us, postulates that man is a moral being and that he has a free will; and this free will, men of a dualistic bias think, is irreconcilable to the idea of the One and All, to the doctrine of monism.

Dualism, which takes the view that two worlds exist independent of each other, the spiritual world and the material world, does not object to determinism in the material world, but it vigorously maintains that free will obtains in the spiritual world.

Materialism in opposition to dualism claims that freedom of will is a sham, that man has no free will, because his actions are determined throughout by law.

If dualism is right, scientific truth has very little value, for science exists only because natural phenomena are, by strictest necessity, determined with regularity, and do not happen according to hazard or chance. If materialism is right in saying that man's freedom of will is a self-delusion, it would be ridiculous to speak of morals, and ethics (the science of morals) would be a contradiction.

Prof. James takes the dualistic view. He says:

"We postulate indeterminism in the interests of the reality of our moral life just as we postulate determinism in the interests of that of our scientific life."

We are certainly in favor of reconciling "moral life" and "scientific life." We even believe that they were never at variance; they coincide in part. (This, by the bye, is the reason why we speak of the Conciliation of Science with Religion and not of a *Reconciliation*.) But Prof. James' conciliation is a mutual annihilation. Science and Ethics play the part of the famous Kilkenny cats. The moral view and scientific view are two different aspects, howsoever their object may be one and the same thing. A psychologist, a physician, or a lawyer may view the actions of a man from a scientific standpoint, and a clergyman or a historian, or a biographer, or the critic of an author may contemplate the very same actions from a moral standpoint. Should we then, in the former case, take to determinism, and in the latter to indeterminism, or shall we by excluding human actions from the province of determinism, entirely annihilate ethics as a science? And if no science of morals exists, how can we have chairs for "professional moralists" at our universities?

Monism accepts determinism wholly and fully. But from the same standpoint of monism, free will must also be accepted as the basis of moral life. We deny that the issue is determinism *or* free will; in opposition to spiritual and material dualism, we claim determinism *and* free will. We maintain that moral truth and scientific truth, that religion and science, regularity according to law, and free will are no irreconcilable contradictions. They are oppositions complementary to and explanatory

of each other. If one is conceived without taking the other into consideration, our view will be one-sided and squinting. Both together form the monistic view, in which science and religion find their reconciliation.

Those who maintain that free will and determinism are irreconcilable contradictions start from the apparently slight but important error that force and necessity are identical. They think that what happens from necessity suffers from force somehow. They overlook the fact that there is a necessity from force which is effected as if by a mechanical pressure from the outside, and an inner necessity from free will which works with spontaneity according to the character of a man by free decision, but at the same time of necessity. For instance, a man delivers to a highwayman his valuables because he is forced to do so by threats or even blows; he suffers violence; his action is not free. But if a man, seeing one of his wretched fellow-beings suffering from hunger and cold through extreme poverty, and overpowered by compassion gives away all he has about him, this man does not suffer force. He acts from free will, but being such as he is, he so acts of necessity according to his character.

In my pamphlet, *Monism and Meliorism*, the problem of free will is treated in section v, § 1-3. In § 1, the hedonists or utilitarians are contrasted with men of religious bent, and in § 2, their differences are stated and discussed:

"Religionists usually adhere to the dogma of free will, while the hedonists do not accept this doctrine, but proclaim it to be in contradiction to the unyielding law of causality. It is the third of Kant's antinomies. The religionists take the positive side of the *thesis*, and the hedonists the negative of the *antithesis*. If there were no freedom of will, ethics would not exist, for it is freedom that implies the responsibilities for one's actions.

"Now, according to the law of causality, the actions of man result through the same necessity as any event or phenomenon. It is a strange confusion to make of necessity and freedom a contradictory opposition, so that either would exclude the other. If a man can do as he pleases, we call him free; but if he is prohibited from following motives which stir him, if by some *restraint* or *force* he is limited, he is not free. But every man, if he be free or restrained under a certain condition, under exactly these and no other circumstances must, of necessity, will just as he does will, and not otherwise. As to this there is no doubt, if causality is truly the universal law of the world.

"The confusion from which so many errors arise, is due to the similarity of the concepts *force* and *necessity*. Force may lay a restraint on free will. Where force rules, free will is annihilated. Necessity, however, is no force. Whoever is unable to make this distinction, will never get a clear insight into the theory of free will. Necessity, in such a case, is the inevitable sequence by

which a certain result follows according to a certain law. It is the internal harmony and logical order of the world. Force, however, is an external restraint, and a foreign pressure exercised to check and hinder by violence. Give the loadstone freedom on a pivot, and it will, of necessity, turn toward the north, according to the qualities or properties of magnetism. But if you direct it by a pressure of the finger to some other point, you will exercise some force, which does not allow it to show its real nature and quality. Were the loadstone endowed with sentiment and gifted with the power of speech, it would say in the first case: 'I am free, and of my free will I point toward the north.' In the second case, however, it would feel that it is acted upon and forced into some other direction against its nature, and would declare its freedom to be curtailed.

"It is the same with man; and the moral worth of a man depends entirely upon what motives direct his will. An ethical estimate of moral actions is not possible, except under the condition that they are the expression and realization of free will. The best action would amount to nothing if it were a mere chance result which might have occurred otherwise. The whole value of any moral deed rests on the fact that the man *could not*, under the conditions, act otherwise than thus, that it was an act of *free will*, and, at the same time, of inevitable necessity."

The actions of free will are just as much regulated by law as any other natural phenomena. The moral *ought* certainly involves *can*. Two men under the very same conditions *can* act differently; but a man of a certain character and under certain conditions, if he is free, will necessarily act in accordance with his character and not otherwise. The actions of a man who is not free, whether they are good or bad, have no moral value. Freedom is the *sine qua non* of morality and moral responsibility. But an action which does not result of necessity, which happens by chance, like a play at dice and might have been otherwise, has no moral value either.

And if the free actions of man were not regulated by law, if free will meant that a man of certain character under certain conditions could act otherwise than he does, if free will were identical with chance, if, in a word, free will were indeterminism, this kind of free will would not only destroy science but morals and ethics also.

Free will and determinism do not exclude each other. Free will is a postulate of morals, determinism is a postulate of science. The actions of a free will are not irregular or without law; they are determined by the character of the acting man.

Indeterminism is unthinkable in science as well as in morals; it would make every action a morally indifferent and scientifically indeterminable phenomenon. P. C.

## SONG.

MAY DAY WISHES.  
TO LOUIS BELROSE, JR.

My baby boy, were life's annoy  
By wishing warned away,  
Good-luck would shower bright snow-flower,  
On this your first of May.

No leaf at all would ever fall  
To mark the passing year;  
But Time would bring with every spring  
New bloom of hope and cheer.

The lips that tell your name so well  
Without a word—my rose—  
Would kiss the dew while life is new  
From every bud that blows;

But violet eyes, where now surprise,  
Turns ever to a smile,  
Would hold the star that guides afar  
Though wayward Love beguile;

Until the Sprite, one summer night,  
With moon upon the vale,  
And soft winds south, should turn your mouth  
From rose to nightingale.

If what I would were what I could  
Within those little ears,  
The laugh would meet a world's heart-beat,  
And sound of falling tears;

That breast would swell with truth to tell,  
And song I failed to sing,  
Till every word should, like a bird,  
Burst forth on fearless wing;

And armed with might to guard the right,  
Though strong to wield the sword,  
Those little hands would bring the lands  
To peace and one accord.

But, baby mine, come rain or shine,  
Despite the stars above,  
Each year will bring the flower of spring,  
And no year take my love.

## CORRESPONDENCE.

## PROFESSOR VON GIŻYCKI AND DETERMINISM.

To the Editor:

CAMBRIDGE, MASS.

I have read with interest the essay in your columns with which Professor von Giżycki has done me the honor to couple my name, and to which you invite me to reply. You surely wouldn't tempt me to plunge into the length and breadth of the free-will controversy, or to fight with my learned Berlin friend over points of detail. So, though I have to accuse him of hardly addressing himself to my main line of argument at all, I will just make one brief remark on his conclusion. [Let me say, by the

way, that my original article (the source of all this trouble) was called "The Dilemma of Determinism," and was published in the Boston *Unitarian Review* for September, 1884.]

Professor von Giżycki believes in determinism absolute and universal. Such determinism is, of course, monism. Every particular thing being pure effect, determined *ab extra*, there is no substantial reality except in the consolidated total, the One and All. Now any One and All which determines some of its features to be *bad*, is a morally irrational being. Those features *ought to be removed yet cannot be removed* so long as that One and All exists. *Ought* rationally involves *can*; and a frame of things which keeps the two asunder is a discord. It was to escape this moral discord in the absolute and total nature of things that I turned my back upon the One and All and postulated pluralism and indeterminism instead. Professor von Giżycki says we needn't turn our backs, but can escape the moral discord in the simplest possible fashion, thus: deny all moral character whatsoever to the One and All, and, of course, it can't be morally irrational any more than it can be morally rational. "Not being responsible," it is not a term of moral relations or an object of moral judgments at all. The latter are but elements of human psychology, anthropomorphisms having no connection with the world at large.

This attempt at exorcising moral irrationalism is pouring out the child with the bath with a vengeance. It is as if a judge should decide a lawsuit by ordering the goods in dispute to be burned. To save the monistic system, we are asked to give up the very notion of there being any *truth* in our moral sentiments at all. One could understand this from a commonplace materialist, but for a professional moralist like Professor von Giżycki, it is a queer attitude to take contentedly. Rather than put up with such a despairing solution, one would expect a man with any sense for the reality of morals to keep the ball of uneasy speculation rolling, to live on the ragged edge, to gnaw the file forever.

It is certain that mankind at large will never take as a satisfactory terminus for thought the notion of a One and All, which is the deepest reality, but which is either immoral, or if moral, morally absurd.

None of those evils of indeterministic pluralism which Professor von Giżycki depicts are quite as bad as that. We claim indeterminism, we claim that good things were *possible* where bad things now are, in the interests of moral activity, just as we claim determinism in the interests of scientific activity. The result must probably be a concession on the part of the *universal* claimer of some of its claims. Indeterminism is no universal claimer. It only asks to exist *somewhere* in the world; and this claim is incompatible with the existence of an absolute One and All—I see, by the bye, that you, Mr. Editor, propose "THE ALL" as an object of worship, and even of "imitation." If nothing will satisfy you but that amazing object, a noun of multitude, don't you think that "THE HALF" will work rather better than "THE ALL"? Indeterminism is practically contented with the half, or even much less.

WILLIAM JAMES.

[Professor James calls the "One and All so far as it determines some of its features to be bad, a morally irrational being." And in another passage he says: "It is certain that mankind at large will never take as a satisfactory terminus for thought the notion of a One and All, which is the deepest reality, but which is either immoral, or if moral, morally absurd."]

Ethics does not deal with the morality of the One and All, nor with the morality of a God beyond the limits of the universe. The "One and All" being as it is the sum total of reality or existence, cannot properly be called moral or immoral; to say that it is morally indifferent would be still more incorrect. We might just as well in hygiene speak of the health of the One and All as in

ethics of its morality. And it would be wrong at the same time to declare that nature and the laws of nature are hygienically indifferent and have nothing to do with the rules of health. Ethics is a moral hygiene; it investigates and gauges all the actions of rational individuals, such as men are on earth. If such beings act in harmony with the All, and the laws of the All, we call them moral; if they act contrary to the All and its laws, we say that they are immoral.

Prof. James seems to overlook that monism teaches the immanence of force in matter, of God in the All, and of causality in phenomena. He says: Not every "pure effect" must be "determined *ab extra*." Effects determined *ab extra* may be properly called mechanical effects. The action of a free will is irrevocably determined, but it is determined *ab intra*, not *ab extra*. The necessity *ab intra* is called moral freedom, the necessity *ab extra* is force. The monistic God is *vis ab intra*, he is immanent; the supernatural God is *vis ab extra*, he is transcendent. Only the immanent God of monism can afford a satisfactory conception of moral responsibility, as Goethe says (according to Dr. Lindorme's translation in OPEN COURT, p. 355):

The God whose being in mine shadows,

Can rouse my soul to active will;

The God whose throne's beyond my powers,

For purpose, will and deed is nil.

In reference to the conclusion of Prof. James' letter, I declare that, if worship is taken in the usual sense as an act of adoration, or a submissive cult of self-humiliation, I do not propose to worship the One and All. However, if worship is to signify what it does according to its etymology (Anglo-Saxon *weardscipe*), considering and bearing in mind the worth of something or of somebody, I do propose to *worship* the One and All. We should fully appreciate its import for our lives, and for those who shall live after us. Such a worship is one "in spirit and in truth."<sup>1</sup> It will keep us in harmony with humanity as well as with this One and All itself. About "the half" with which Professor James is contented, we shall speak on another occasion when we discuss the idea of God.

The editor's view of determinism and free will is found on page 887 of THE OPEN COURT. EDITOR.]

## BOOK REVIEWS.

OUTLOOKS ON SOCIETY, LITERATURE AND POLITICS. *Edwin Percy Whipple*. Boston: Ticknor & Co.

This volume of essays from the pen of one of the most accomplished and brilliant writers of English in his day, is made up of fugitive pieces gathered from the magazines and other sources where they were first published, and, we believe, a few posthumous pieces. We should have been glad if an editorial word had been preface to the contents of this volume to give the reader a somewhat better idea of the date and circumstances under which these essays were first written. We recognize the "Hardhack" contributions as of *Atlantic Monthly* origin, if our memory serves, and also a few others, as the essay on "Domestic Service" and "The Swearing Habit." We recall the fresh delight and stimulus we used to receive in the reading of Whipple, and are conscious, in the re-reading of portions of this volume, of a faded glow and inspiration, but this is the experience incidental, in a measure, to the second perusal of all works and authors that were our early favorites. There are a number of political essays in this volume which will doubtless prove useful reading to the new student of the troubled era of President Johnson and reconstruction, but which seem of a rather time-worn character to the general reader. Yet the lover of Whipple, who has won his admirers worthily, will wish to add this latest collection of his writings to the rest.

C. P. W.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XII.

### THE DEPARTURE FROM THE ESTATE.

Autumn had come; the trees about the house had assumed their colored dress of decay, white webs hung over the stubble and the dewdrops lay upon them till the wind tore them and bore them from field and valley into the blue distance. A happy pair went hand in hand about the place. This year the fall of the leaf did not affect the Professor, for a new spring had begun in his life; and his happiness was written in his countenance in characters which might be read by the most unlearned.

Ilse was betrothed. Modestly she bore the invisible crown which, according to the opinion of the household and neighborhood, now encircled her head. There were still hours in which she could scarcely believe in her happiness. When she rose early from her bed, and heard the trailing of the plough, or when she stood in the dairy amidst the clattering of the milk pails, her future appeared like a dream. But in the evening, when she was sitting near her beloved one, listening to his words and conversing on subjects serious and trifling, she would lay her hand gently on his arm in order to assure herself that he belonged to her, and that for the future she would enter into the life in which his spirit moved.

The marriage was to take place before the winter, and before the lectures began at the University; for the Professor had petitioned against a long engagement and the father had yielded.

"I would gladly have kept Ilse with me over the winter, for Clara must assume a portion of her duties, and the guidance of her sister would be very useful; but it is better for you that it should be otherwise. You, my son, have proposed for my daughter after a short acquaintance, and the sooner Ilse accustoms herself to the life of the city, the better it will be for you both; and I think it would be easier for her in the winter."

It was a time of happy excitement, and the necessity of providing for the new household brought down the feelings of the betrothed from their state of exaltation to earthly things.

The Professor made a journey to the University. He went first to his friend.

"Wish me joy," he exclaimed; "have confidence in her and me."

The Doctor embraced him and never left his side during his stay; he accompanied him in all his shopping and assisted him in the arrangement of the rooms. Gabriel, who, from the visit of the country gentleman had anticipated coming events, and who had become doubtful of his own indispensability, felt proud when the Professor said to him:

\*Copyrighted.

"Between you and me things remain as they were; do your best to make yourself useful to my wife."

Then came Herr Hummel; in the name of the family he presented his congratulations, and of his own accord offered the use of two rooms in his house which he himself did not occupy. But Laura was more anxious than all the rest about the new inmate. She burst forth in verse thus:

"How will she be, of sweet or lofty mien?  
Most dignified, or charmingly serene?  
My heart beats fast and thoughts in chaos seem!  
Will fond anticipations prove a dream?"

When the Professor begged of her and her mother to receive his future wife with friendliness and help her in her arrangements, and when he added to Laura that he hoped she would be on a friendly footing with his bride, he did not guess how much happiness he had given that young heart, which felt an unquiet longing to attach itself devotedly to some one. The indefinite descriptions which he gave concerning the character of his intended made a very vague impression which to Laura became a frame in which she daily depicted new faces.

Meanwhile the women were occupied in the old house preparing Ilse's outfit. The approaching marriage of her sister had transformed Clara into a young lady; she helped and gave good advice and in everything showed herself clever and practical. Ilse was praising this in the evening to her father and then threw her arms around his neck and burst into tears. The father's mouth quivered; he did not answer, but he held his daughter close to his heart. It fortunately happened that the last weeks before their separation were full of work and distraction. There was yet much to be done in the household and the father would not permit the betrothed couple to omit a single visit to his acquaintances in the neighborhood.

One of the first was to the family of Rollmaus. Ilse had informed Frau Rollmaus in a special letter of her betrothal; this had created great excitement. Frau Rollmaus triumphed; but Rollmaus had his horse saddled and rode to Bielstein, but not up to the house. At the gate of the court-yard he inquired for the proprietor, and rode to him in the field. There he took him aside and began his congratulations with this short question:

"What is he worth?"

The question could be satisfactorily answered and he seemed satisfied. For he turned his horse round, trotted up to the house and presented his congratulations to Ilse and her betrothed, whom he now looked upon as her equal, and this time he pressing repeated his invitation. After his return, he said to his wife:

"I could have wished a better match for Ilse, but the man is not so bad after all."

"Rollmaus," replied the wife, "I hope you will be have properly on this occasion."

"What do you mean?" asked the Crown Inspector.

"You must propose the health of the betrothed couple at dinner."

The husband growled. "Well, then, but without any useless trash-like oratory, or being overpowered by feelings; I will have nothing to do with that."

"The eloquence must be in the introduction," said Frau Rollmaus; "and if you will not do it I will undertake it myself, and you merely bring the health."

The house of Rollmaus displayed its finest table linen and dinner service for the visit, and Frau Rollmaus showed not only a good heart but good cooking. After the first course she clinked her glass and began excitedly:

"Dear Ilse, as Rollmaus, in proposing your health, will express himself shortly and laconically, I will just mention beforehand that as old friends of your parents, we wish you joy from our hearts. And as we have lived together as good neighbors, sympathizing both in misfortune and when there was an agreeable addition to the family, and as we have often rendered each other mutual assistance in household matters, it is very sad for us that you are going to leave this part of the country. Yet we rejoice that you are going to a city where intellect, and higher aims are appreciated. I will not be voluminous, therefore I beg of you both to remember us with true friendship."

She put her handkerchief to her eyes and Rollmaus expressed the family feeling generally in four words:

"Health to the couple."

At departing Frau Rollmaus wept a little and begged the proprietor to permit them to be at the marriage, though no other guests were to be present.

There was to be still another distraction. The Prince wished to stop on the way to his hunting castle and take breakfast in the old house.

"It is well, Ilse, that you are with us," said her father.

"But one does not know at all what such a person is accustomed to," rejoined Ilse, between pleasure and anxiety.

"His own cook will come over from the forester's house; he will help. Only see to it that he finds something in the kitchen."

It was a day of busy preparation, and the children, the housekeeper and the workwomen sat among heaps of branches and autumn flowers, twining wreaths and garlands.

"Spare nothing," said Ilse to the old gardener; "he is the beloved father of our country. We, his children, bring him our flowers as a tribute."

Hans, with the help of the Professor, arranged immense emblems and monograms of dahlias.

The evening before the hunt the purveyor and cook, with their attendants, arrived. The purveyor begged

leave to set the table in the garden. "The Prince will be accompanied by the necessary servants; the rest of the waiting may be done by the waiting-maids of the house. The country customs will please the Prince."

On the morning of the chase the proprietor rode in his best clothes to Rossau to receive the Prince, and the children thronged round the windows of the upper story, spying along the highway like bandits. Shortly before midday the carriage came up the hill and stopped at the door of the house. The proprietor and forester, who were riding on each side of the royal carriage, dismounted. The Prince descended with his suite, greeting them as he crossed the threshold. He was of advanced age and middle height; had a small delicate face, from which could be seen that in youth he had been considered a handsome man, with two intelligent eyes, beneath which were many small wrinkles. Ilse entered the hall and the proprietor introduced his daughter in his simple way. The Prince greeted Ilse graciously with a few sentences and favored the Professor, who was presented to him as bridegroom of the daughter, with some attention; whereupon the Professor was invited by the master of the hounds to join the party at breakfast. The Prince stepped into the garden directly, praised the house and the landscape and mentioned his recollection of having been here with his father as a boy of fourteen.

Breakfast passed off admirably. The Prince asked questions of the proprietor, which showed an interest in the condition of the country. When they arose from the table, he approached the Professor, asked particulars about the University, and knew the names of several of his colleagues. The answers and general demeanor of the learned man induced him to prolong the conversation. He told him that he himself was somewhat of a collector; he had brought ancient coins and other antiques from Italy and any increase in his collection gave him much pleasure. And he was pleased to find that the Professor was already acquainted with several of the more important ones.

When the Prince, in conclusion, asked the Professor whether he belonged to this country, Felix answered that accident had brought him here. It suddenly occurred to him that this was an opportunity, which might never recur, of making known to the highest power in the country the fate of the lost manuscript, and thereby, perhaps, gaining an order for further research in the residence. He began his account. The Prince listened with evident excitement; while cross-questioning him about it, he drew him further from the company and seemed so entirely engrossed in the affair as to forget the hunting. The master of the hounds, at least, looked at his watch often and spoke to the proprietor of the interest which the Prince seemed to take in his son-in-law. At last the Prince closed the conversation:

"I thank you for your communication. I value the

confidence which you have shown me. If I can be of any use to you in this matter apply directly to me; and should you happen to come into my neighborhood, let me know. It would give me pleasure to see you again."

When the Prince passed through the hall to the carriage he stopped and looked round. The master of the hounds gave the proprietor a hint. Ilse was called and again made her obeisance, and the Prince in few words thanked her for her hospitable reception. Before the carriage had disappeared from the farm-buildings the Prince again looked back to the house, and this civility was fully appreciated.

"He turned quite round and gave a look of peculiar interest," said one of the laborers' wives, who had placed herself with the working people near the evergreen arch by the barns.

All were contented and rejoiced in the graciousness and civility which had been given and received in good part. Ilse praised the Prince's attendants, who had made everything so easy; and the judicious questions of the Prince had pleased the Professor much; and when the proprietor returned in the evening, he related how well the chase had gone off, and that the Prince had spoken most kindly to him and had wished him joy of his son-in law before everybody.

The last day that the maiden was to pass in her father's house came. She went with her sister Clara down to the village, stood by the window of the poor Lazarus, stopped at every house and committed the poor and sick to the care of her sister. Then she sat a long time with the Pastor in his study. The old man held his dear child by the hand and would not let her go. On departing, he gave her the old Bible which his wife had used.

"I meant to take it with me to my last abode," he said, "but it will be better preserved in your hands."

When Ilse returned she seated herself in her room and the maids and workwomen of the house entered one after another. She took leave of each of them separately and spoke to them once more of what each had most at heart, gave comfort and good advice, and a small keepsake from her little store. In the evening she sat between her father and lover. The tutor had taught the children some verses; Clara brought the bridal wreath, and the little brother appeared as a guardian angel; but when he began his speech he burst out sobbing, concealed his head in Ilse's lap and would not be comforted.

When at bed-time they had all left, Ilse for the last time sat in her chair in the sitting-room. When her father prepared to retire, she handed him a candle. The father put it down and paced up and down without speaking. At last he began:

"Nothing shall be changed in your room and when you return to us you shall find it as you left it. No one

can replace you on this estate, neither to your brothers and sisters nor to your father. I give you up with sorrow to enter upon a life which is unknown to us both. Good night, my beloved child; Heaven's blessing upon you. God guard your noble heart. Be brave, Ilse, for life is full of trials."

He drew her to him and she wept quietly on his breast.

The following day the morning sun shone through the windows of the old wooden church upon the place before the altar. Again Ilse's head was surrounded by a heavenly radiance and the countenance of the man into whose hand the old Pastor laid that of his favorite beamed with happiness. The children of the house and the workwomen of the farm strewed flowers. Ilse, with her wreath and veil, stepped over the last flowers of the garden, looking heavenward. From the arms of her father and sisters, amid the loudly expressed blessings of Frau Rollmaus and the gently-murmured prayer of the old Pastor, her husband helped her into the carriage. Another hurrah from the people, one more glance at her old home, and Ilse pressed the hand of her husband and clung closely to him.

#### CHAPTER XIII.

##### THE FIRST GREETINGS OF THE CITY.

The leaves were falling in the woods around the city. Ilse stood at the window thinking of her home. The wreaths over the door were faded, the linen and clothes were stowed away in the presses, her own life glided on so quietly, while all around her was noise and bustle. Her husband was sitting in the next room over his work; no sound but the rustling of the leaves as he turned them penetrated through the door and at times the clattering of plates in the kitchen which was close by. Her dwelling was very pretty, but hedged in on all sides; at one side the narrow street; behind was the neighboring house, with many windows for curious eyes; toward the wood, also, the horizon was shut in by grey trunks and towering branches. From the distance, the hum and cries of the busy town sounded in her ear from morning till night; above were to be heard the tones of a pianoforte, and on the pavement, without ceasing, the tread of the passers-by, wagons rolling and loud voices quarreling. However long she looked out of the window, there were always new people and unknown faces, many beautiful equipages and, on the other hand, many poor people. Ilse thought that every passer-by who wore fashionable attire must be a person of distinction, and when she saw a shabby dress she thought how heavily life pressed upon the poor here. But all were strangers to her; even those who dwelt near, and could watch her proceedings on all sides, had little intercourse with her, and if she inquired concerning individuals, the inmates of her house could give but

scanty account of them. All was strange and cold and all was an endless tumult. Ilse felt in her dwelling as if she were on a small island in a stormy sea, and this strange life caused her much anxiety.

But, however gigantic and noisy the town seemed to Ilse, it was at bottom a friendly monster; nay, it fostered perhaps, rather than otherwise, a secret inclination to poetic feelings and to private courtesy. It was true that the stern burgomasters had given up the custom of welcoming distinguished strangers with wine and fish, but still they sent their first morning greeting through their winged protégés, which had already delighted Ilse's father. The pigeons flew round Ilse's window, crowded against the panes and picked at the wood till Ilse strewed some food for them. When Gabriel removed the breakfast, he could not refrain from taking some credit to himself:

"I have for some weeks scattered food before this window, thinking it would be agreeable to you to see them."

And when Ilse looked at him gratefully, he continued ingenuously:

"For I also came from the country, and when I first came to the barracks I shared my rations with a strange poodle."

But the town took care that other birds should become intimate with the lady from the country. On the very first day that Ilse went out alone (it was an unpleasant walk, for she could scarcely resist stopping before the showy shop windows, and she colored when people looked boldly in her face), she had found some poor children in front of a confectioner's, who looked longingly through the windows at the pastry; this longing look had touched her and she entered and distributed cakes among them. Since then, it happened that every noon there was a slight ringing at Ilse's door, and little children, in tattered clothes, produced empty cans, which were filled and carried home, to the great vexation of Herr Hummel, who could not approve of such encouragement to rogues.

When Ilse, on the evening of her arrival, was taken by her husband into her room, she found a beautiful cover spread over her table, a masterpiece of fancy work, and on it a card, with the word "Welcome." Gabriel stated that Fräulein Laura had brought this present. The first visit, therefore, on the following morning was made to those who occupied the lower story. When Ilse entered the sitting-room of the Hummel family, Laura sprang up blushing, and stood embarrassed before the Professor's wife; her whole soul went out to the stranger, but there was something in Ilse's demeanor that inspired her with awe. Ah! the much longed-for one was undoubtedly noble and dignified, even more so than Laura had expected; and she felt herself so very insignificant and awkward that she shyly received Ilse's warm thanks

and drew back some steps, leaving it to her mother to do the talking. But she did not weary of gazing at the beautiful woman and, in imagination, adorning her figure with the finest costumes of the tragic stage.

Laura declared to her mother that she would like to make the return visit alone, and on the first suitable day stole upstairs in the twilight hour with beating heart,—yet determined to have a good talk. But, as accident would have it, immediately after her arrival the Doctor entered, disturbing the peace, and consequently there was nothing but a fragmentary conversation, and hackneyed forms of speech which were very unsatisfactory. She took leave, angry with the Doctor, and dissatisfied with herself because she had found nothing better to say.

Since then the new lodger upstairs became an object of incessant and secret adoration to Laura. After dinner she placed herself at the window, watching for the hour when Ilse went out with her husband. Then she watched her from behind the curtains with admiration. She would often flit over the hall-way and about the door of the lodgers; but when Ilse appeared in the distance she would hide, or if she met her she would make a deep courtesy and, on the spur of the moment, could only think of ordinary things to say. She was much troubled lest her pianoforte playing might disturb her, and inquired at what hours it would be least annoying to her; and, one day when that nuisance of a red dog had snarled at Ilse and had maliciously bitten into her dress, she was so angry that she took her parasol and drove the monster down stairs.

In her mother's name—for she could not venture upon it in her own—she began a campaign of small attentions against the tenants of the upper floor. When vendors offered their tempting wares for the kitchen, Laura would frequently disappoint Herr Hummel's epicurean tastes; for she regularly sent the young geese and fat hens upstairs, till at last the servant, Susan, became so bitter at this preference of the lodgers that she besought the aid of Frau Hummel. One day Laura learnt from Gabriel that the Professor's wife had asked for a certain kind of apple; Laura hastened to the market and searched till she found a little basket of them and brought them home; and this time she compelled even Herr Hummel himself to send up the basket with many compliments. Ilse was pleased with these household courtesies, but did not guess the secret source.

(To be continued.)

Never value anything as profitable to thyself which shall compel thee to break thy promise, to lose thy self-respect, to hate any man, to suspect, to curse, to act the hypocrite, to desire anything which needs walls and curtains.—*Marcus Aurelius.*

Woman, once made equal to man, becomes his superior.—*Socrates.*

## BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M. D.

Part V.

DIET—CONTINUED.

The study of the moral influence of diet, in its qualitative aspects, reveals equally suggestive, and not less strangely ignored, facts. No practical agriculturist would hesitate to admit that the adaptation of any soil for the production of special crops can be modified by the use of special fertilizers. No beast trainer would deny the fact that the energy, the intelligence, the docility, in short, the *psychological condition* of any animal can be influenced by a change of diet. But the exponents of human psychology persist in ignoring such factors of causation.

"For many years," says Herbert Spencer, "after men of science had become uniformitarians in geology, they remained catastrophists in biology; while recognizing none but natural causes in the genesis of the earth's crust, they ascribed to supernatural agency the genesis of the organisms on its surface. Nay, more, among those who are convinced that living things in general have been evolved by the continued interaction of forces everywhere operating, there are some who make an exception of man, or who, if they admit that his body has been evolved in the same manner as the bodies of other creatures, allege that his mind has been not evolved, but specially created."

The same fallacy of dualism still rejects the physiological basis of ethics. Even by independent thinkers, nay, by many of our foremost educational reformers, the "immortal soul" is still treated as an *alter ens*, an entity governed by laws so distinct from those of nature in general that a dietetic suggestion by a spiritual adviser would appear as irrelevant as a miracle legend in a treatise on marine steam engines.

The hyperphysical tendency of our established system of ethics continues to influence the fields of inquiry so long monopolized by its dogmatists, and yet the chief boast of that system, the alleged contrast between the patient meekness of its converts and the vindictive violence of unregenerate man, can be proved to be mainly a result of dietetic habits. At the court of the Guicovar of Baroda (British India), Captain Gordon Elliot saw a

"fighting horse," a special pet of the sport-loving prince's, who, by way of experiment, had fed a young stallion, at first on a mixed diet of chopped meat and oats, and finally almost on meat alone. Before the end of the third year the descendant of herbivorous ancestors had become a predatory beast of most aggressive tendencies. Without the slightest provocation he would rush upon every visitor of his den, beat down goats or dogs with plunging kicks of his forefeet, and devour their entrails with all the greed of a famished hyena. He also attacked other horses, and once killed a wild boar which a day before had vanquished a panther; and the fierceness of his onsets resembled the rage of a vicious bulldog, rather than the petulant caprice which now and then impels cart-horses to use their teeth on each other.

The naturalist Brehm, on the other hand, mentions the achievements of an Abyssinian beast-tamer who trained young leopards to associate with his pet baboons, and ascribes his success to the milk and durra bread diet which his speckled prisoners were obliged to share with their four-handed fellow captives. The best breed of Scotch shepherd dogs never taste meat and are permitted to suck a nursing ewe till their teeth grow strong enough to masticate hard cheese and oatmeal cakes. The smooth-skinned dogs which the Chinese have for centuries fattened for culinary purposes have undergone a curious metamorphosis of disposition. They are more gentle and submissive than the tamest spaniels, but seem to have lost their hunting instinct, and their timidity qualifies their value as watch-dogs.

There is no doubt that some tribes of the human race have degenerated in the opposite direction. The courage of the pluckiest varieties of our next relatives, the frugivorous four-hander, is purely defensive. The mischievous pranks of the strong-fisted chimpanzee always stop short of actual cruelty; the brutal treatment of a defenseless fellow-creature excites the shrieking protests of the same baboon who a minute ago amused himself with twisting the tail of his playmate. In his rough-and-tumble sports with his fellow pets, my young mandrill forbears to make use of his teeth, but if a couple of dogs engage in a *bona fide* fight, he is sure to rush in and part the combatants. It is more than probable that under normal conditions of development the human mind, too, manifests an instinctive abhorrence of cruelty. Children shudder at the gory scenes of a slaughter-

\*Copyrighted.

house, and it is a significant circumstance that in nearly every known language the equivalents of the word *humanity* are used as synonymes of a merciful disposition. The paradise legends of the Semitic nations, and the traditions of the "Saturnian Age" of ancient Italy and Greece, preserve the memory of an era of horticulture and peace preceding the period of nomadic and predatory habits. The nature-abiding Greeks, with all their fierce hatred of despotism and love of warlike sports, were at heart averse to scenes of bloodshed, and when it was proposed to increase the attractions of the Panhellenic games by the introduction of Roman gladiators, the citizens of Athens and Corinth rejected the offer with the remark that the proconsul would first have to tear down the altars of mercy.

Man's entire system of physical organization bespeaks a frugivorous adaptation; but by the same means that transformed the disposition of the Baroda stallion, our North American Indians and the hunting tribes of southern Africa have become imbued with all the sanguinary instincts of beasts of prey. The murderous internecine wars of our American aborigines preceded the time when the intrigues of their Caucasian rivals fostered the causes of disunion, and were chiefly due to the same instincts of truculence that impels a mink to exhaust the chances of every favorable opportunity for slaughter; and the history of our western border wars abounds with the records of unprovoked massacres and inhuman butcheries of prisoners that might have been ransomed on terms which only a mania of bloodthirst could have induced needy captors to refuse. Gordon Cumming, Dr. Schweinfurth and Mungo Park agree in their accounts of the hideous cruelties which constitute the favorite pastimes of the carnivorous savages of central Africa; and it is a suggestive fact that all the meat-surfeited nations of the Caucasian race are characterized by a penchant for sanguinary sports. The neglect of agriculture and the abundance of cheap pasture grounds make animal food a predominant ingredient in the fare of the natives of the Spanish peninsula, and the *matanzas* (literally butcheries) of their bull-rings kindle an enthusiasm much more incomprehensible to their French neighbors than to their British fellow beef-eaters. In the border towns of the Spanish Pyrenees, *matanzas* have been almost relinquished in deference to the protests of French residents, while in Matamoras, El Paso, and other cities of the Rio Grande frontier, bull fights, though denounced by the Anglo-American press, are liberally patronized by Anglo-American spectators, a class of sightseers by no means limited to "cow boys" and border ruffians.

Carnivorous habits prevail both on the table lands of central Asia and in the jungles of the Sunda archipelago, and the blood feuds of the sluggish Malay are carried on with the same pitiless ferocity that marks the

border raids of the restless Turcoman. The Hindostan vegetarians, on the contrary, extend their blood-aborring humanity even to the lowest of their dumb fellow-creatures. With infinite patience the native fruit-planter of the Punjab will drive off a troop of pilfering monkeys again and again, rather than save themselves all further trouble by killing a few of the long-tailed marauders. In the suburbs of Agra, a British gardener who had shot and crippled a *kalong* (a frugivorous bat), was pursued by a howling mob, who finally cornered him in a side alley and with shrieks of execration shook the squealing harpy before his eyes. To the followers of Brahma, a "fox-hunting parson" is a preposterous anomaly. "The war-whoop of a prize-fighting nun," says an English writer, "would not amaze those rice-eaters more than the words of the Anglican rector who assembles his domestics for morning prayer, and then dons his shooting-jacket and calls out to his son: 'Say, Jack, get your shotgun; let's go and try and kill something.'"

Race influences have a share in the causation of such contrasts, but we cannot deny the race affinities of the fierce Tartar huntsman and the submissive vegetarians of the Chinese coast lands. The agricultural negroes of the lower Senegal differ in disposition from the carnivorous negroes of the upper Congo, as a rice-fed Shanghai dog differs from a Turkestan wolf-dog. A still more remarkable contrast is perhaps that of the *Indios bravos* and *Indios mansos* of northern Mexico. The "brave" redskins, including the Apaches, the Yaquis and scattered tribes of the Arapahoes, subsist almost exclusively on the products of the chase, and never fail to utilize a chance for murder and devastation. Colonel Ruxton's "Adventures in Mexico and the Rocky Mountains," details instances of barbarity which almost justify that bounty proclamation of a Governor of Chihuahua, who offered "a shot premium of five dollars for the skull of every wolf, Apache or puma, delivered at the office of the City Comptroller Hernandez."

The *Indios mansos*, or "tame Indians," on the other hand, subsist on brown beans and the produce of their banana gardens, and deserve their name by an ultra Buddhist patience of non-resistance. To the ruthless oppression of their Spanish taskmasters they opposed nothing but prayers, and on failing to accomplish their allotted task of gold-washing or log-hewing, would often travel thirty miles afoot to report for trial and its barbarous consequences. Professor Stevens, the explorer of Yucatan, mentions a perhaps unparalleled instance of self-abasement, practiced in a popular drama—a veritable passion-play—of the Pinto Indians. A crowd of shackled slaves congregate on the stage, rubbing their sores, and by mutual assistance succeed in removing their fetters. Huddling together in a corner, they compare notes on their experience, and the recital of their martyrdom at last develops the initial phase of a

conspiracy. Knives are sharpened and bow-strings fastened; but in the midst of these preparations a vulture-nosed and fierce-whiskered Spaniard appears on the scene, and by the discharge of a horse-pistol succeeds in frightening the malcontents into unconditional surrender, so effectually, indeed, that many of them crawl upon their hands and feet and submit their necks to the boot-heel of the bearded Castilian!

Yet the ablest ethnologist would fail to distinguish the skull, the complexion and the physiognomic characteristics of the long-suffering *manso* from those of his truculent kinsman.

Carnivorous habits engender aggressiveness, moridity (more or less modified by the influence of domestication), ill-will, vindictiveness and a peculiar restless disposition, often ascribed to quite irrelevant causes. Compare the zigzag trot of the captive panther and the impatient rushes of the captive hyena with the complacent attitudes of the captive deer, or the lazy good humor of the semi-vegetarian bear. In Polk county, Tennessee, I once attempted to domesticate a she-fox with a litter of cubs, and had frequent opportunities to study the effects of dietetic experiments upon the disposition of my prisoners. After a good meal of milk, bread and blackberries, the *materfamilias* would turn over on her back, playing with her youngsters for hours together, or dandling with a ball tied to the end of a whirling string. A meal of meat—even as much as the refuse scraps of a dressed rabbit—would set her trotting to and fro to the full length of her tether, every now and then giving her chain a spiteful tug and confirming such symptoms of ill-humor by vicious snap-bites at the heels of every passer-by. The influence of the stimulating diet seemed to react even on her progeny, for on meat-day her usually tranquil cubs would scamper up and down my veranda steps and often overcome their youthful timidity to the degree of climbing the fence and exploring the adjacent woodlands. Hence, perhaps, also the nomadic penchants of our North-American autochthones, and the *impulsive restlessness* (quite distinct from industrial enterprise) of our Anglo-American population, with their predilection for three daily rations of rich meats. The French peasant, with all his Gallic vivacity, never emigrates while his ten-acre patch offers him a frugal chance of subsistence, while the exodus mania of our farming population has carried thousands of families from the sylvan paradise of the southern Alleghanies to the alkali deserts of the Far West.

The character-type of carnivorous animals harmonize perfectly with the exigencies of their predatory habits. A nursing she-wolf, in quest of prey, has often to range the scant hunting-grounds of the wilderness for hundreds of miles, and the ferine aggressiveness of the Bengal tiger doubtlessly turns his dreadful work into a source of pleasure. But few moralists of the present genera-

tion would dare to trace the effect of analogous causes to their influence in aggravating the discords of temper and duty, of passion and precept, in the spheres of civilized life:

"Mel in ore, verba lactis,  
Fel in corde, fraus in facie,"

describes only the symptoms of a phenomenon not confined to the meat-gorged prelacies of the middle ages. "Alas, what avails all theology against a diet of bull-beef," writes Father de Smet from the Sioux missions; but our home missionaries seem agreed in ignoring the effects of cognate causes. The report of a recent convention of prison reformers mentions, however, a noteworthy remark of a Belgian delegate, who held that in the management of indoor workers a bill of prison fare prescribing a preponderance of meat rations, would be a refinement of cruelty, since the characteristic influence of such food would make the irksomeness of restraint an almost unbearable affliction.

#### THE FUNDAMENTAL PROPERTIES OF MATTER.

BY J. G. VOGT.

Translated from the German by F. W. Morton.

##### III.

We now proceed to the core of our investigation. If the organic world is a strictly bounded whole, if we can adduce proof that organic substance constitutes a definite, severed part of the world-substance, then by an arrangement of organic elements analogous to chemical elements it will surely be easy to make possible an explanation of organic phenomena. The difficulty and cause of confusion is, that organic substance, under whatever fluctuations, springs from inorganic and again returns to it. Indeed, we can even at will develop organic substance from inorganic; and daily we see organic substance fall again to inorganic.

This simple undeniable fact drives us with imperative necessity into the arms of a monistic view of the world, i. e. regarding all as *one*. Every fundamental property which we are forced to attribute to the world-substance in order to explain any phenomenon, must belong to *every part* of this world-substance, and therefore, according to an atomistic conception of matter, to *every separate atom*.

According to our conception of substance every center of condensation must evidently run the entire scale of feeling and be able to accommodate itself to *all* the phenomena of the world without exception. It can, therefore, play an equally correct role in both the great divisions, the organic and the inorganic realms.

If just now we found it impossible to deduce from the current physical or mechanical conceptions of matter the organic phenomena, so we find it likewise difficult to establish the monotonous regularity and lifelessness of inorganic substance from the old established conceptions of organic substance (according to which the in-

organic must be a sort of weathering product of the organic.) How can the kinetic philosopher explain how the atom of oxygen that, during millions of years, has rested in granite, passive and dead, suddenly becomes possessed of conscious feeling when it is afforded an opportunity of entering a brain cell? Or how, on the other hand, can biology explain how the atom of oxygen, to-day a part of a brain cell and possessed of conscious feeling, is to-morrow united with carbon and cast out as carbonic acid, again to enter the circle of purely physical, dead, mechanical processes?

None of the former conceptions of matter explain or establish the fundamental difference between organic and inorganic activity. Yet, this difference exists, and a consistent idea of matter must above all things take it into account.

In the work above referred to I have shown how the chemical elements, i. e. the old atoms, become groups of condensation centers, while the ether only springs from such original centers. Physics teaches us that all bodies, i. e. all material matter, can be reduced to three states of aggregation—gaseous, fluid and solid. Every chemical element can run the entire scale of condensation, and, according to our theory, likewise the entire scale of feeling, if the external conditions are furnished for it. Every atom by condensation can pass from the conscious feeling of life to the unconscious condition of repose.

In strict accordance with our theory, heavy, condensed matter, like the metals, minerals, etc., which approach near to the maximum value of condensation in the positive direction, will be excluded from all conscious feeling; their state is a thoroughly passive and lifeless one, in direct opposition to those substances which exist in a fluid or gaseous state of aggregation, which are susceptible of conscious feeling, and therefore play the chief role in the organic world. We know that carbon, oxygen, hydrogen and nitrogen principally form the structures of the organic world. If to them, even, in the course of time, the possibility of condensation, of transition to a solid state were offered, all manifestation of conscious feeling would cease, and the organic world would be destroyed. Our world, benumbed and rigid, would rest in endless sleep, at least until after æons, in the course of cosmical cycles, the stiffened masses should again be called to new life.

We thus see that it depends solely on the degree of density, or the state of aggregation of an atomic body, whether it can take part in the organic phenomena of life or not. And in strict accordance with actual facts, there prevails, according to our theory, no fundamental difference between an organic and an inorganic substance. Whatever be the fluctuations, the latter can pass from the former and back again into it. One error, however, we shall have to avoid, namely, that there is

a definite limit at which a tangible line of demarkation between organic and inorganic conditions of matter can be drawn. On the contrary, observation teaches us, and the principle of activity in the centers of condensation—that is, the unalterable striving, under all circumstances, for the maximum density—forces us to the assumption, that each atom in every state of aggregation, and therefore even under the highest negative fluctuation, must exclude an inorganic, i. e. a simply physical mode of activity. The higher the negative fluctuation of an atom, the more energetic are its vibrations of contraction; and I have shown in another place how in these vibrations of contraction on the negative side are to be found, above all, the impulse toward chemical unions. For example, an atom of oxygen which, in consequence of its high negative fluctuation, becomes possessed of conscious feeling can in the same or the next moment enter into a chemical union and therefore manifest a thoroughly physical course of action. The irresistible impulse toward condensation, however, impresses on every atom the sameness of the physical course and at the same time imparts to the latter the appearance of firm, unalterable regularity.

Now, while the physical or mechanical action of an atom necessarily takes it through all states of aggregation and degrees of density, we have on the other hand to assume a point somewhere on the scale of condensation at which the conscious feeling of an atom becomes extinct. It is, to be sure, impossible to determine this point even in the remotest way. We may, however, assume, that in the solid state of an atom this rise of manifest consciousness has been passed; indeed, that it may already have been passed in the fluid state; and that to the gaseous state alone belongs the real manifestation of consciousness. Accordingly, so far as it corresponds to the different degrees of density as exhibited in the centers of condensation, this scale of feeling would move in a negative direction.

In the work already cited I have shown how even in the gaseous state an atom may still traverse an immeasurable series of volumes, so that no especial difficulties would lie in the way of limiting the entire scale of feeling to the gaseous state. Yet this would not mean that all expression of feeling is to be relegated from the fluid state in which the maximum value of condensation is not yet reached; but, that in all probability these modes of feeling are no longer likely to possess that degree of brightness which produces consciousness and which the generation of organic activity demands. The same may also be true of many a degree of density in the solid state.

Now it may be justly asked: If the scale of feeling runs parallel with the scale of density of the gaseous state, if conscious feeling is joined with a high degree of negative fluctuation, must not the manifestation of

conscious feeling, on the other hand, be attributable to all physical and, especially, chemical processes, to which matter in the gaseous state is subjected? This thoroughly pertinent question leads us to the central point of our investigation, to the fundamental distinction between the inorganic and the organic forms of matter.

We have to imagine the contracting tendencies of the center of condensation as disturbed with so high an intensity that such a center, which suffers a negative fluctuation, seeks instantaneously to free itself from this. Thus in the shortest space of time, perhaps millions of these gradations, volumes of density, and, therefore, perhaps the entire scale of feeling, is traversed. I refer here for example to the chemical processes which I have exhaustively treated in another place (v. Force, *Chapter on Chemism*), and in which I have shown how the negative fluctuation or tension is driven to a corresponding height, until emancipation results and the chemical union, together with the accompanying condensation of the new atomic group, takes place *instantaneously*.

That perceptive actions of feeling come into play in all chemical and physical processes is therefore undeniable; but it must likewise be seen that in such a momentary traversing of the scale of feeling a distinct difference between the separate modes of feeling is not possible. These can attain to no marked conscious expression; the rapid succession of the degrees of the scale will yield only a vague product which excludes all individual feelings. This is seen in *all* mechanical processes or acts, for we know of no single instance where the reaction of the particles concerned would not be an instantaneous, explosion-like, momentary one. Indeed, upon this instantaneous reaction of the minutest particles from every mechanical impact depends the velocity with which light, electricity, sound and heat are transmitted.

The manifestation of a clearly and distinctly marked conscious feeling, on the other hand, demands exactly the opposite, i. e. a *constant* permanency in a definite degree of density. When, for example, the conscious product of feeling must come to expression as *red*, it is clear that the center of condensation must *continually* maintain that degree of density which corresponds to the mode of feeling, *red*. If this degree of density is of but momentary duration, it is self-evident that the sense-product *red* cannot attain to permanent consciousness. All our actual feelings, however, are characterized by such permanent and therefore sharply distinguished conditions of feeling.

When I speak, therefore, of the mechanical conditions of sense-perception, only such are to be understood as, in direct opposition to all physical or mechanical processes, maintain a *permanency* of a certain degree of density, of a certain condition of activity. Our conscious feeling does not arise by impacts of separate feelings, which are separated from one another, so to speak, by

unconscious intervals of space; but it represents a *continuum*, a continuation of an unbroken *state of activity*.

The fundamental characteristic of the inorganic processes, as distinguished from the organic, consists in this, that while in the former the activity of the particles concerned is always a momentary one, in the latter this activity is a *continuous* one. In the inorganic processes the condition or state of repose, after its expiration, is again striven for and attained; in the organic processes, on the contrary, this state is never reached. I say expressly, in the organic processes this state of repose is never reached. For, if conscious feeling is dependent upon the highest degrees of negative fluctuation in a center of condensation, it is clear that in the negative fluctuation all feeling is *forced upon* it. The negative fluctuation can never be *striven for*; it must always be *impelled or forced toward*. And with it also the manifestation of feeling.

In unmistakable accordance with this we meet in the organic world, as one of its fundamental features, the desire for rest, for inactivity. Life is *forced* upon our planet. If the boundless light and heat of the sun did not uninterruptedly necessitate the high negative fluctuation, all life would immediately vanish from the face of our planet. Nay, further, the temporary absence of the sun's rays during night is sufficient to crown this striving for rest in the organic world with temporary success and banish conscious perception. Feeling, life and activity are forced upon organic matter, and it must not surprise one if, on such a fundamental basis, even with us human beings the condition which we designate as *dolce far niente* exerts such an irresistible charm. The strife for rest is a peculiar feature of the whole animal world.

#### AN ENGLISH MONIST.

BY XENOS CLARK.

To those who understand clearly the present intellectual drift of the world, there is something amusing in the tenacity with which religious sectarians still contest their minor battles. While the whole theological ship is in flames, and intelligent people everywhere are looking for their life-preservers, we see these contentious passengers engaged in disputes over their state-rooms. "Never mind your state-rooms," one feels like shouting in their ears; "unless something happens the whole ship will be gone presently."

One need only refer, for illustration, to the Andover controversy, in which the leading orthodox sect of the country is divided against itself on the question whether there is probation in the future life for the unenlightened heathen. Probation in the future life, indeed. Unhappy disputants, who do not see that while they fight for the branch the whole tree has disappeared! For who among men now-a-days can say that there *is* a future life?

When filled with weariness by the spectacle of such contentions as these, it is with gratitude one turns to a writer who deems it his office to put aside disputed points, and to ask whether there are not some matters on which, despite the current skepticism, all good and intelligent men can unite in belief. "The author is one of those simpletons," says Professor Seeley of Oxford, in the preface to his *Natural Religion*, "who believe that, alike in politics and religion, there are truths outside the region of party debate, and these truths are more important than the contending parties will easily be induced to believe." And Professor Seeley goes on, in his interesting book, which is certainly of the ablest, to elucidate these "truths outside the region of party debate."

I say Professor Seeley's book is of the ablest, but the characterization is imperfect. Beyond question his *Natural Religion* is the most acute, the most novel, as it is also the most solid, the most instructive, and the most really helpful contribution that modern liberalism has made to literature. I do not think anyone who has read the work will call this over-praise. It should be added that it is also a book of special interest to readers of this journal, since in his attempt to find a "common basis of belief for all thoughtful men," Professor Seeley has adopted a form of monism which has many resemblances to that advocated by THE OPEN COURT. Some of these resemblances it is my present purpose to point out, though I cannot hope to do anything like justice to a work which is too compact with thought to permit a summary that shall be both brief and satisfactory. It must suffice, at present, simply to make a statement of Professor Seeley's main theological position, to outline his new idea of a Deity; an idea so broadly conceived that its author thinks no man, be he scientist or theologian, can refuse acknowledgment.

This Deity whom Professor Seeley thinks all men can unite in acknowledging is, to begin with, not a theological abstraction by any means. It is the Universe seen in its order and oneness, and especially in its oneness. However they differ on other points, he believes all men can join in worshipping a "unity conceived in one way or another as holding the universe together," since this unity is an obvious fact, taught by all science and observation. In truth, the most striking thing about Nature to a reflective mind, is its unity, the fact that it coheres in one vast, orderly whole. We are so used to the spectacle that we grow indifferent to it; we search afar for a god when here one stands obvious to our eyes. Now, the author of *Natural Religion* contends that this wonderful unity of Nature can take the place of God; contends even that it is a "greater Deity than the average Christian worships." And why, he says, should we not call it God, since it can take the place of God—since we can look upon it with adoration and fear, can indeed worship it? "Men slide easily from the most

momentous controversies into the most contemptible logomachies. If we look at things, and not merely at words, we shall soon see that the scientific man has a theology and a God, a most impressive theology, a most awful and glorious God. I say that man believes in a God who feels himself in the presence of a Power which is not himself and is immeasurably above himself, a Power in the contemplation of which he is absorbed, in the knowledge of which he finds safety and happiness. And such now is Nature to the scientific man."

We should misunderstand our author, however, if we attributed to him, on account of the above paragraph, a desire to re-establish the old theism of the churches. By what he calls God he simply means the unity of Nature. We might call it Nature, instead, he says, but since the word "Nature" does not arouse in us thoughts of worship and devotion, and since the word "God" does, the latter is preferable to a writer who is seeking to arouse religious rather than skeptical thoughts.

The wonderful unity of Nature is therefore the new deity to whom Professor Seeley would lift men's eyes in the present days of doubt. Science has come, theology has fallen before it, and the world is Godless, men have exclaimed. "Not so!" cries this new voice. "Science itself has revealed to us a Deity—yes, a grander and greater one than we have ever known before!"

The skeptical will ask what there is in this Unity of Nature that entitles it to this new role; what are its credentials; wherein is it aught save a mere phenomenon, like the rest of Nature? The unity of Nature is not a mere phenomenon, because it holds phenomena together; because without it Nature would be a drifting chaos, while with it it is an orderly and interdependent whole. With this Power that unifies phenomena, that makes the All, we are but poorly acquainted, but that does not contravene its evident existence, or make it less awe-compelling. It is a Power which men can worship, since, on the one hand, its proportions are so vast and wonderful, and, on the other, it is so intimately and beneficially interwoven with all the processes of human life. "But it is not merely because he realizes a stupendous Power that I call a scientific man a theist. A true theist should recognize his Deity as giving him the law to which his life ought to be conformed; and there is no stronger conviction in this age than the conviction of the scientific man, that all happiness depends upon the knowledge of the laws of Nature, and the careful adaptation of human life to them."

The Power that gives unity to Nature, that makes it One, can therefore be worshiped because it supplies to man the law of life. It can be worshiped also because its manifestations are infinitely interesting and beautiful. "He who studies it has continually the exquisite pleasure of discerning, or half discerning, and divining laws; regularities glimmer through an appearance of con-

fusion; the mind is haunted with the sense of a vast unity not yet discoverable or nameable." And finally, the unity of Nature is to be worshiped because we have a personal relation to it, because our own lives, our own minds, belong to and come from this mysterious Power, and are a part of it.

It will thus be seen that *Natural Religion* would not have us worship Nature simply as Nature in the poetical sense. Not because of the flooding sunshine, the strong mountains, the calm stars, does science call us to the worship of its new Deity. But because sunshine and mountains and stars, and all the wonderful things that are, do not live apart, but are bound together in a yet more wonderful *Whole*. They are these separate words, the Whole is the complete and pregnant sentence. We have not read the sentence yet, but who has not felt that its meaning may be something vast and deep, beyond all our ken?

(To be concluded.)

#### MAKING SCARCITY.

BY WHEELBARROW.

Some time ago I made a few remarks upon that "competition" hobgoblin, which makes the hair of workingmen stand up in fright, "like quills upon the fretful porcupine." From my boyhood, it was a terror to me, but it does not scare me now. As I grew older I grew bolder, and at last I walked close up to it and examined it. I found it was a hollow pumpkin, with eyes, nose and mouth cut in it, and stuck on a stick clothed in the drapery of a white sheet. I see that the President of the Federation of Trades Unions has exhibited this venerable old ghost to the Senate Committee on Education and Labor. Whether it scared the committee or not I cannot say. Since then I have noticed that some other gentleman has appeared before the same committee, in company with the same specter, and demanded that convict labor shall not be put in competition with the mechanic trades, but shall be exclusively devoted to the business of "working on the roads."

I have tried to analyse the principle of non-competition, as enforced by the trades unions, and so far as I have been able to resolve it into its constituent elements, its chief ingredients appear to be monopoly and selfishness, with some very foolish dread of the evils of abundance. Take this convict labor question for example. Convict labor is not opposed on any ground but that of "competition." It competes with outside labor, that is, it produces something, and this production is the injury complained of. Let us reduce the question to a concrete form. Suppose that the two thousand convicts in the penitentiaries of Illinois are all compelled to work at the shoemaking trade, and suppose that they each make a pair of shoes a day, or 62,400 pairs a year, will it be contended that the addition of this number of shoes to the common stock is an injury to the people of Illinois?

There is no one who will claim that; but the President of the Federation will say: "It is an injury to the shoemakers' trade, and therefore it ought to be prevented."

Very well, then make tailors of the convicts. This plan doesn't solve the difficulty either, for the tailors won't agree to it, nor the tinkers, nor the tanners, nor the masons, nor the carpenters, nor any other trade. As the butcher, and baker, and candlestick-maker all refuse to work in competition with the convicts, and as none of these economists are daring enough to require that the convicts live in idleness, an easy solution of the problem is found by compelling them "to work upon the roads." But really this is only shifting the difficulty, and is no solution at all. At school I have solved many a hard problem in long division, which is as far as I went, by getting some other boy to do the sum for me, and the President of the Federation adopts the same plan with the convict labor difficulty. He dumps it on the "laborer" class, and says: "Here, you man with the wheelbarrow, work this hard sum." But I am not able to work it, because I find that I cannot set the convicts at any useful employment without putting them in competition with somebody. They must either live in idleness at the expense of the community, or they must earn something to pay for their board; to earn something they must produce something, and that is an addition to the aggregate wealth of the people, at which we all get a nibble at last.

If adding to the wealth of the country is an injury, then subtracting from that wealth must be a benefit, and therefore the destruction of shoes and clothes, and houses and furniture, must be a desirable thing; the Chicago fire, instead of being a great calamity, was a great blessing. This fallacy is firmly cherished by workingmen; it is the guiding principle of trades unions, and is productive of want and poverty incalculable. It was instilled into me in my very childhood, and it was late when I got rid of it. "I never ate a meal, when a boy, that was not somehow or other complicated with the everlasting consideration of 'work.'" When I got a good dinner I knew that my father was "in work;" when the meal was scanty I knew that he was "out of work." In our home all human affairs whirled round and round the image of "work" forever. A big fire devoured a street—"It will make work," I heard my father say. A ship was lost at sea laden with silk, and leather, and cloth—"It will make work," said my father. A reservoir broke jail and swept the heart of the town away—"It will make work," my mother said; and so all human calamities were softened as blessings to me; they made work, and work made wages, and wages made bread and potatoes and clothes for me. God bless the shipwreck, and the fire, and the flood; they make

"Work, work, work, till the eyes are heavy and dim,  
And work, work, work, till the brain begins to swim."

Oh, comrade of the trowel, the needle, and the awl; oh, toiler at the anvil and the loom; oh, brother of the jackplane and the shovel; oh, chivalry of toil by land and sea, it is not work we need so much as rest. Let us make all the wealth we can, and destroy nothing; let us not be jealous of each other's talent, but teach each other everything we know. Let us make plenty in the land, and then let us try to shape our social system and the laws so that a fairer share of it will come to us after we have made it.

Last fall I picked up a newspaper and read in great black headlines this alarming news: "A Heavy Frost. It spread over various sections of the Northwest Friday night. Early planted corn escaped with little injury; the late crop practically ruined." It requires no great skill in political economy, as they call it, to understand that the blighting of the corn crop is a great calamity; it means less food the coming winter, and less food means less of clothes, and coal, and wood. And yet there are a lot of workmen who would regard a blight of the hat crop, or the shoe crop, or the coat crop as a blessing to labor; but in truth they are all equally injurious as the blighting of the cattle and the corn. Food, and clothes, and furniture, and all necessities of life, are so intimately related, that the blight of one is the blight of all, and it means less of each to the workman.

It is easy to prove by the doctrines of the anti-competitionists that this disaster to the corn crop is a good thing, because it removes from the farmers living south of the frost line the competition in the corn market of the farmers living north of it. And it is also a good thing for the people who have old corn in the bins; but this is a narrow and selfish way to look at it, and if the doctrine be carried out to its logical end it elevates to the rank of a moral principle the unnatural dogma that the prosperity of one man depends upon the adversity of another. Once upon a time I had a job of "work on the roads" not far from an Indian agency. The tribe had just been paid off, and the Indians were trading at the store up at the agency where I happened to go for some tobacco. They were buying some needles, for which the trader charged them fifty cents apiece. They complained of the price, but when the trader assured them that the needle-maker was dead, and the needle-making industry thereby terminated, they appeared satisfied. This lying excuse for the high price of needles presented to me a tough problem in economic science, and I went up to the shanty to work it out.

I lighted my pipe, and tried to read the solution of the problem in the clouds of smoke. The first question to be answered was this: Suppose the needle-maker was really dead and his art lost forever, would that be a good thing? I had no trouble with this question at all. I could readily see that although it might be a good

thing for the man who happened to have a large stock of needles on hand, it would be a bad thing for everybody else. The next question was not so easy. It was this: Suppose that one-half of the needle-makers in the world should die to-night, would that be a good thing in an economic point of view? It took several pipes of tobacco to answer this question, and I am not sure that I got it right even then. The answer involved so many collaterals. It was very clear that if every needle-maker was a master, and not a journeyman, those who survived, being relieved of competition to such a great extent, would make good profit out of it by raising the price of needles, but the community would still be losers. But suppose that of the survivors 95 per cent. were journeymen, and 5 per cent. masters, where would the new profits go? Labor being a marketable thing, the masters would still want to buy it at the old figures, and the journeymen would get but a trifling raise of wages, while the increased value of needles would nearly all go into the pockets of the masters. But even supposing that the increased profit were fairly divided between them, the community would still have to pay it, and, therefore, the sudden removal of so much competition in the trade would be an injury, and not a benefit. Applying this rule to every other trade and occupation, it appeared to me that the loss of wealth, or of wealth-producing capacity, is injurious to the community, that the workmen cannot be benefited by such loss, and that all attempts to create a scarcity of competition by crippling talent, or forbidding the industry of anybody, can only be of local or personal benefit here and there, and the pursuit of such false systems of relief is a sad waste of the moral strength of the workingmen.

"Nature abhors a vacuum," is a maxim in physics, and in moral philosophy also. So nature tries forever to preserve an equilibrium in the moral and material universe. The very earthquakes and volcanoes are efforts in this direction, and men can no easier keep trades unbalanced than they can disturb the level of the sea. Create a vacuum in any trade and nature rushes in to fill it. If I could give paralysis to every shoveler to-night, how long should I enjoy my monopoly? In a week I should see shovelers galore. The telegraph operators made a vacuum, but only for an instant; it at once began to fill; in a month the hole was almost gone. We may think we have destroyed competition by excluding a brother craftsman here, but he or somebody else has slipped in over there, for the struggle of life goes on. We must liberate labor, and exalt it by grander schemes than these.

The source of final happiness is inherent in the heart; he is a fool who seeks it elsewhere. He is like the shepherd who searched for the sheep which was in his bosom.—*Hindu Vemana*.

## IGNORAMUS AND INVENIEMUS, NOT IGNORABIMUS OR INVENIMUS.

Some time ago the world of science was startled by Du Bois-Reymond's declaration of a seven-fold *ignorabimus*. Quite in harmony with English agnosticism this prominent German scientist despaired of ever attaining to a satisfactory solution of the most important problems in science and philosophy. He found much opposition, and many of his colleagues opposed him with a triumphant *invenimus*. We stated our view on the subject in the editorial of No. 23, "The Unknowable," in which we declared that the agnostic Unknowable is a chimera; the very essence and nature of natural phenomena is knowability. There is no mystery in nature of which we can proclaim an *ignorabimus*. Those questions, however, as to the ultimate cause of existence at large, which from their very nature admit of no answer—the transcendent or metaphysical problems as they are often called—are not justifiable. Such a thing as an ultimate cause, or a first cause, is a self-contradiction; an ultimate cause is an absurdity and exists as little as fabulous griffins and sphinxes. A sphinx will always be an enigmatic creature as long as we believe in its existence and try to realize how it can possibly live, and breathe, and have its being. The result of profound study and thought on the life of a sphinx will always be a modest and humble *ignorabimus*. But the sphinxes of science, the unexplainable mysteries of nature, are creatures of our own imagination. We can dispense with ultimate causes as well as with unknowabilities altogether. If we fully understand what causality means, the mystery which shrouds nature is dispelled. We shall see that nature's work is open and clear, not hidden and secret; it is knowable and not inscrutable.

As to the existence of reality, or the existence of the world at large, we accept it as a fact. A fact must be verified by statement. To prove a fact, means to verify it by witnesses. Existence at large, or the existence of the world, viz.: the truth that there is something at all cannot be explained by comprehension as phenomena are explained, it cannot logically be deduced by syllogisms or mathematical demonstrations. We must accept it like other facts on the evidence of witnesses. The chief witness in this case are we ourselves. By our very existence we bear testimony to the truth of the existence of reality, and this is the truth which is at the bottom of Descartes' dictum, *cogito, ergo sum*.

In thus taking the side of those who, encouraged by the success of science in so many fields of inquiry, rejoice in their *invenimus* (i. e. we have found a solution), we freely acknowledge also our *ignoramus* on many, and, indeed, on most important subjects. But observe, while the desperate *ignorabimus* (the we-shall-never-know) is an insurmountable obstacle to the progress of science, the modest *ignoramus* (the we-do-not-yet-know)

is an inexhaustible source to furnish new food for thought and investigation. The *ignorabimus* stands in contradiction to the *invenimus*; but the *ignoramus* very well agrees with an aspiring and hopeful *invenimus*, i. e. we shall find the solution of the problem, for the problem in itself is not insolvable.

We cannot find fault with the proud *heureka* of a Pythagoras. The *invenimus* of scientists can only become dangerous to science if it is the satisfied expression of a narrow-minded, self-contentedness. There are many problems, which, when once settled, are settled forever. But even they will only be a basis for further inquiry, as human cognizance can never embrace the rich and great totality of all possible knowledge in all its particulars.

In true science the *ignoramus* and the *invenimus* will always go together. The range of nature is so wide and the scope of science is so large, that with each problem solved we can be sure that new problems will arise; but none of them will be insolvable, and each *ignoramus* naturally carries with it its *invenimus*. P. C.

## THE BIRTH OF SATAN.

BY WM. SCHUYLER.

The first time man did conscious wrong,

He recognized mysterious powers;

That, like a tempest fierce and strong,

Blighted and killed life's fairest flowers.

Then, wondering what the cause might be,

He never thought himself to blame—

Supposed it was an enemy—

And so the birth of Satan came.

And even now, with broadened mind,

Man will not bear the blame of evil;

But seeks some alien cause to find,

While he himself remains—the Devil.

## CORRESPONDENCE.

To the Editor of THE OPEN COURT:

I was very much interested and edified by the discussion in the last number of THE OPEN COURT on the subject of conciliating or reconciling Religion with Science. The subject is an important one, and suggests to my mind many reflections.

In my opinion the position taken by your critic was very well answered by the editor. As I view the subject, a true science and a true religion need no conciliation. Like all great truths they are always, and necessarily, in harmony. The fact is, a true religion is a department of science, and is capable of a scientific explanation.

The conflict is only between science and a false or supernatural religion. The issue to-day is mainly between the advocates of a rational and natural, and, therefore, a scientific religion, and the devotees of an irrational and anti-natural religion.

If THE OPEN COURT proposes to conciliate science, properly so called, with a supernatural religion, it is undertaking to accomplish an impossibility. On the other hand, if it proposes to conciliate that which needs no reconciliation, namely, a true science and a natural religion, it is doing a work of supererogation.

However, I think your position has been made sufficiently clear, viz.: that when properly understood, there will be seen to exist no conflict, no antagonism between religion and science.

The question is, has the *concept, idea or emotion*, for which the abstract term *religion* stands as a symbol, a true and valid basis in the human mind, and if so, what is the cause of it? We answer, it has, just as much so as have the *concepts* of truth, goodness, justice, beauty, love and order, which are symbolized by the terms science, art, law, family and civil government.

The reason and cause of all these are to be sought for and found in the *relations subsisting between man and his environments*. The principle of *natural selection* operating by *conservative inheritance* on the one hand, and by *progressive adaptation* on the other will explain them all.

Now, in considering the question of religion or any other real phenomenon of human nature, we must not lose sight of the scientific fact that man is a *part* and a *product of nature*.

That he has been built up in nature, body and mind, and constantly subjected to its powerful influences. Emerging from an ape-like ancestry of arboreal habits into the savage man of the stone age, and born into a world of elemental strife, with no instruments of use or defense, save his own ingeniously constructed hands and feet, (so constructed by "natural selection,") he contended as best he could against the elements and the animals for the preservation of his life and the care of his offspring.

As necessity required, he invented implements of industry and warfare. The hand and the tongue kept pace with each other. As his reason developed, his occupations and implements increased, and his language became enriched.

From this lowly condition, in which all his energies were taxed in the struggle for existence, he has progressed by slow and tedious steps through long periods of time up to his present magnificent attainments. In the course of this development the sentiment we call religion was evolved in man.

Two dominant forces, namely, *nature and society*, constantly operating on his mental organism, produced in him mental and moral traits, such as memory, consciousness, conscience, sympathy, love, fear, hope, courage, wonder, and a feeling of dependence.

The genesis of his religions must, therefore, be traced to these two sources, the *influence of mankind over man*, and the *influence of nature over man*. The first produced in him *love of offspring, fear of the strong, fear of death, and belief in ghosts*, which was the foundation of *ancestral worship*.

*Ancestral worship* was the great fountain-head of all the polytheisms, monotheisms and anthropomorphic religions.

*Ancestral worship*, fear of the dead, and belief in ghosts among our remote ancestors, were the prolific sources of the doctrine of metempsychosis, idol worship, strange customs of burying the dead, descriptions of the condition of souls in the spirit land, holy books, holy times and places, miracles, prophecies, oracles, witchcraft, trial by ordeal, saints, holy ghosts, gods, devils, angels, and indeed all the doctrines and dramatic personae of the *theological stage*. Of course, as man improved his condition and became enlightened, these religions were refined and elevated from a crude fetishism to the worship of a Supreme Spiritual Being, but of course with many imperfections and anthropomorphic notions still clinging to their conceptions of Him. We have briefly alluded to the great stream of religion which took its rise in *man's influence over man*, and which has flowed down through human history, blessing and cursing mankind. Refining as man refined, and reverting to the *ancestral type* whenever and in the degree that man degenerated.

Let us now turn and glance at that other *original source* and fountain-head of religion, namely, the *influence of nature over man*. These religions are properly called *natural religions*, while those of the *ghostly order* are denominated *anti-natural or supernatural*

*religions*. The leading religions of this order may be classed by their generic names as follows, viz.: Fetishism, Zootheism, Polytheism, Monotheism, Theism. Of course, Judaism, Christianity and Mahometanism belong to this great order. The religions, or as some prefer to call them the philosophies, derived from *nature worship*, are usually denominated Atheism, Pantheism, Paganism, Deism, Agnosticism, Monism. This is by no means intended to be a complete list of the great religions, but only a few of the important ones. The great and venerable *super-natural* religions, with their immemorial memories, their traditional worship of a *man-like deity*, their dogmas of a *fallen world*, of a *place of salvation*, of a *personal devil*, of a hell of burning brimstone, and a ten by twelve heaven, are destined to lose their hold over the human mind. They certainly can claim the *past*, but the *future* is less secure.

*Scientific pantheism*, with the accent on the *second syllable*, is coming forward with its claims of a *natural religion*, based on *scientific principles*, to contest the *future* with its great and ancient antagonist. It already has a great following of devoted worshippers outside, and many inside of churches. It holds that all men are more or less religious by virtue of their organizations, and that all are immortal and may be happy if they will obey the conditions of their being and the *laws of nature*.

Some think religion is only an emotion of fear and ignorance, and one of the incidents in man's evolution, and will some time be outgrown and eliminated. I think otherwise. Man inherits a sentiment of religion, which may be cultivated and improved by proper surroundings, the same as any other emotion. Science or knowledge of the universe will never destroy or eradicate man's admiration of the works of nature. Indeed, I should rather suppose that a scientific knowledge of the universe would enhance man's feelings of the true, the good, the beautiful, the sublime, the sentiments of love of God and love of man—in fine, his *religious emotions*. The child, the Indian, has these emotions to some degree; the man of thought, of culture and great attainments, to a much greater degree. Man, always environed by the same universe, I cannot see how he will outgrow the religious sentiments and emotions which it inspires; his notions of religion will refine as he refines, but the intellect or the reason will never *annihilate* the emotions.

Crude notions of religion have indeed been entertained by great men from the time of *Menu* and *Moses*, down through the ages to the present time; but modern science, the hand-maid of *Monistic philosophy* and *Pantheistic religion*, is leading men to purer and sublimer visions of the universe, and consequently to clearer emotions, a grander conception of God, and a more enlightened worship.

Whoever will take the pains to investigate the religious history of the world, will find, I think, after sifting and analysing a good deal of the rubbish of history, *two great conceptions of religion*, which are often found united. But however commingled they may be, in this or that form of literature or worship, they will on a final analysis be found to have distinctive characteristics.

One inculcates an anti-natural religion, a dualistic philosophy, and the worship of a *supernatural God outside of nature*, by and through some *god-man or holy book*, all for the avowed purpose of escaping from a present fallen condition and a future *inferno*, an evil doom of unimaginable horrors.

The other system inculcates a *natural religion*, a *monistic philosophy*, the purest humanities without intolerance or superstition, and the adoration of an infinite Divine Intelligence; through *nature* pure and simple, because it is a joy and a beatitude to thus commune with the source of All Being. With such a religion as this, which has not to be *authenticated* by prophecies and miracles—science is in accord and needs no reconciliation.

*Pantheism* has come down to us mainly through *Arjan*

sources. From Indian or Hindoo Brahminism, through the *Magi* of Persia, through the Greek and Roman mythologies and philosophies and through Arabian and European literature and science of the Middle Ages to its *present form*. *Anthropothism* has come to us chiefly through the *Semitic* races and languages.

From Assyrian idolatry through Judaism, Mahometanism and Trinitarian Christianity. These great religions have built temples and tombs, mosques and monasteries, castles and cathedrals, and dedicated them to the worship of their several deities. They have maintained wars at the command of their gods—conducted pilgrimages and crusades, overrun and conquered countries, and established powerful governments and systems of worship.

They have encouraged superstition, persecuted heresy, opposed progress, science and philosophy. Maintained a priesthood that inculcated dogmas, miracles and oracles, and taught the people to abjure the joys and pleasures of life; to hate the face of nature, to mourn and weep; to look away from the earth and toward the skies for comfort and consolation.

Let us now turn from the past and view the present and the prospect. *Scientific Theism* or *Modern Pantheism* with its doctrine of an organic and dynamic cosmos permeated with *divine life, love, and intelligence* is coming forward, backed by the best minds of the age and claiming our attention and our devotion.

In philosophy it is monistic, optimistic, scientific, and in accord with the great theory of Evolution and Modern Art, learning and civilization.

In religion it is *eclectic* and cosmopolitan—it gathers and gleans the good and true from every system. It inculcates all the sweet humanities, all the virtues and moralities, and worships a divinity of Infinite and ineffable glory, who floods the soul of every man with his love and presence as the light and heat of the morning sun fills all our dwellings with its effulgent rays.

Liberal Unitarian Christianity is the best organized exponent of these views in this country. But there is as yet no adequately organized expression of this *rising religion*. It exists in the expressed and unexpressed thoughts and feelings of our greatest and best men and women *inside* and *outside* of the Christian churches; in literature, in science, art, philosophy, and in common every-day life.

The church of the future is being evolved from elements inside and outside the great Christian church of the present, and when it comes, as come it will, it will be broad enough and grand enough to recognize and receive the true, and the good, and the beautiful wherever found. It will be a religion that will welcome and receive the sanction and support of the Humboldts, the Huxleys, and the Darwins of science; the Spinozas and Spencers of philosophy; the Goethes and Shakespeares of poetry; the Carlyles, the Victor Hugos and Emersons of literature; and the Beechers and Ingersolls of oratory. Such a religion will of necessity be founded on a *universal science* and art, a *universal human brotherhood*, and one universal divinity.

W. W. RICHMOND.

### OBEDIENCE OR JUDGMENT.

SIR—In looking over THE OPEN COURT I have only just now noticed on page 719, the remarks on probation. Gail Hamilton seems to strike right and left and all around. Yet she does not touch the question, only *her idea* of probation. Suppose we substitute the word *obedience* for probation, and consider that the power which has given laws to the universe requires obedience in all things and all creatures; obedience in the storm-cloud and in the sunshine; in the forming of a snowflake and of a dewdrop; in the running brook and in Niagara; obedience in all growth and all activity; in health and in disease; obedience to the laws which govern men in their physical, intellectual, and ethical relations;—would such a change of word be a repudiation of the grand truth latent in probation and patent in obedience? Now, in fact,

myriads who are loyal to law understand just this by the use of that word. And that if creatures, having self-volition, persist in disobeying the laws of their being, not even "the All" of nature can save them from its consequences. The Christian religion offers a Redeemer who has ransomed the erring, but neither Christianity nor naturalism can ransom that or those who persist in disobedience to the laws which govern them.

Another of your contributors prefers to use "the All" for God. Well, let him for our purpose. Let him Anglicise the Greek *ὁ πᾶν*; let him become a Brahmin or a Buddhist. This cannot change the fact of the existence and supremacy of Deity, of something or some One in the government of our world, that makes for righteousness. For use what words we may, there is some power in nature which makes for righteousness. Ethics are but the eternal laws which He has established. Wherefore, if righteousness, right living, right thinking, right aspiration, be the law of our being, that power cannot approve, nor be blended with wrong aspirations, thinking and living in any one. Hence men exclude themselves from Him, exile themselves from Him, and withdraw in their own seclusion of oppugnancy and rebellion. Harmony is the nice adjustment of parts to a whole, whatever that whole may be. You cannot harmonize right and wrong, virtue and vice, loyalty and rebellion. So in nature, so in life, so in eternity, which is the continuance of present life, there must be harmony; harmony among the celestials in the divine presence;—as for creators of discord, they are consigned to the abode of the devil and his angels.

E. COWLEY.

[Rev. E. Cowley is right in saying that "neither Christianity nor naturalism can ransom those who persist in disobedience to the laws that govern them." As to the idea of evil and the evil one we refer to Mr. William Schuyler's poem on page 903 of THE OPEN COURT. Rev. Cowley's view concerning the fate of "the creators of discord" is anthropomorphic, and almost as picturesque as Breughel's famous paintings.—EDITOR.]

LIVERPOOL, March 25, 1888.

TO EDWARD C. HEGELER, ESQ., CHICAGO:

MY DEAR SIR—\* \* \* In THE OPEN COURT of March 1, p. 786, middle of first column, occurs a distinction which I much admire, and which is emphasized by the use of *italics*.\*

Such is the *object* of mechanics. But suppose certain phenomena exhibited residuary motions, not only not accounted for by our present treatises on statics and dynamics, but plainly in excess or deficiency of results such as might be anticipated, all possible corrections having been applied. What then? Are the refractory phenomena to be put out of sight as dangerous to the credit of science? Such discrepancies *there are* in almost or quite all natural laws. But what of that? Be silent about them, for they are odious to men of science, who see in them loop-holes for the introduction of the supernatural! O, most unworthy timidity! These discrepancies are only links which join our true, but lower laws, with less known laws of higher systems, yet not supernatural, but rising tier above tier in unity and harmony, the very highest being as thoroughly in unity with nature as the lowest. It is heart-breaking to hear the positivist's loud worship, not of the united *ἀόρατος*, but of his own text-book on science for 1888.

Are we in no danger of ascribing to the monism of the day, beautiful though it be, a perfection to which it never can attain whilst its foremost followers assume, even as Haeckel, the attitude of *invenimus*? It is a childish dread that to step off the platform of the monism of the day is to plunge into supernaturalism. He is no learner from nature who sees no mystery in her; nay, who

\*The passage mentioned reads as follows: Kirchhoff says: "Mechanics is the science of motion. Its object we define to be this: To describe with exhaustive thoroughness and the greatest attainable simplicity the motions that are taking place in nature."

does not rejoice in its abundance. It is cruel to add another panacea! Monism should do better than join the category of infallible salvations. It is hard to get a hearing for reverent free thought; it seems to offend everybody all round, yet I trust you will not be offended. Believe me your much indebted and grateful correspondent,

HENRY H. HIGGINS.

[We do not object to the word "mystery," as Rev. H. H. Higgins uses it. The world is full of problems, and we rejoice in their abundance. We object to the word mystery in its usual sense of an inscrutable and incomprehensible secret, which by its very nature cannot be known and lies beyond the ken, not only of ourselves, but of all possible comprehension. We refer our readers to the editorial "Ignoramus and Inveniemus," on page 903 of this number.—EDITOR.]

#### NOTES.

Mr. William M. Salter will make lecture engagements for the month of June. Address 516 North Avenue, Chicago.

Professor L. Büchner, whose name is well known among the free thinkers of all countries, informs us in a private letter that since his adult children have left their home, he would be willing to receive guests in his house as permanent boarders. His offer is an excellent occasion, not only for visitors of Germany who would enjoy the company of a profound scholar and a prominent scientist in his leisure hours, but also for parents who wish to send their children abroad. We must add that the city in which Professor Büchner lives has excellent schools. His address is Darmstadt, Germany, 14 Hölges street.

#### BOOK REVIEWS.

LOOKING BACKWARD—2000-1887. Edward Bellamy. Boston: Ticknor & Co.

As the author of "Miss Ludington's Sister" and "A Nantucket Idyl," Mr. Bellamy has won a high rank among modern story-writers. In his last work his imagination undertakes the enticing but difficult task of describing a possible social state to exist at the end and during the progress of a thousand years. It is well written and ingenious, besides holding the reader's interest by the skill and power of the general plot. The object of the book, the author explains with a touch of quiet humor, "is to assist persons who, while desiring to gain a more definite idea of the social contrasts between the nineteenth and twentieth centuries, are daunted by the formal aspect of the histories which treat of the subject."

C. F. W.

The *Popular Science Monthly* for April contains an interesting essay by Prof. T. H. Huxley, "The Struggle for Existence: a Programme," in which the famous scientist, in discussing the question of industrial education, expresses his views upon pre-historic man as follows:

"In the cycle of phenomena presented by the life of man, the animal, no more moral end is discernible than in that presented by the lives of the wolf and of the deer. However imperfect the relics of prehistoric men may be, the evidence which they afford clearly tends to the conclusion that, for thousands and thousands of years, before the origin of the oldest known civilizations, men were savages of a very low type. They strove with their enemies and their competitors; they preyed upon things weaker or less cunning than themselves; they were born, multiplied without stint, and died, for thousands of generations, alongside the mammoth, the urus, the lion, and the hyena, whose lives were spent in the same way; and they were no more to be praised or blamed, on moral grounds, than their less erect and more hairy compatriots.

"As among these, so among primitive men, the weakest and stupidest went to the wall, while the toughest and shrewdest,

those who were best fitted to cope with their circumstances, but not the best in any other sense, survived. Life was a continual free fight, and beyond the limited and temporary relations of the family, the Hobbesian war of each against all was the normal state of existence. The human species, like others, plashed and floundered amid the general stream of evolution, keeping its head above water as it best might, and thinking neither of whence nor whither."

We must add that according to our view Professor Huxley undervalues the import of morality in the struggle for existence. Man survived not because of his toughness, or his shrewdness, but because of his moral qualities. The antediluvian fox was perhaps shrewder, and the lion or bear tougher, than the prehistoric savage or man-ape; but they were lacking in the moral faculties which bind single individuals together with the ties of love, of family and of friendship. Moral feelings, or rather the capacity and conditions of the growth of moral feelings, the tendency to reveal moral qualities, made the primitive man sociable. A social animal develops more morality than solitary beings, and the shrewdness of a social being becomes intelligence. Intelligence is more powerful as a weapon in the struggle for existence than shrewdness, because it does not lack in morality. Human speech is the product of intelligence and not of shrewdness. Man was able to develop speech only because he was moral enough to be social, and this morality elevated man above the rest of the animal world. Among savage tribes the most intelligent and *not* the shrewdest survived. It is an undeniable fact that in any given district the tribes who were lacking in morality, even when the very shrewdest and toughest, had to go to the wall, while in the end the most moral remained victorious. It is a wrong historical view to imagine that the Romans conquered the world because they were shrewder, stronger and more ferocious than their neighbors. They conquered the world because they possessed in addition to strength a rare moral quality—the quality of justice. And even their strength was not the physical force of a ferocious bull, but the moral strength of courage.

It will thus be seen that morality affords the power to survive, and if the primitive savage was not moral in the present acceptance of the word, he was in his time relatively the most moral being on earth, and this gave him more strength than toughness or shrewdness could ever afford.

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

#### CHAPTER XIII.—Continued.

"There is one class of people of whom I am much afraid," said Ilse to her husband; "and that is the students. When I was scarcely grown up and on a visit to an aunt, I saw a whole company of them march through the gates with their large swords, hats with plumes, and velvet coats. They were so wild that I did not venture into the streets all that day. If now, as your wife, I must have intercourse with these rough men, I shall not exactly be afraid of them, but they will make me uneasy."

"They are not all so bad," said the Professor, consolingly; "you will soon get accustomed to them."

Notwithstanding this, Ilse awaited the first visit of the students with much anxiety.

It happened that one morning the bell rang just when the Professor was detained at the University

\*Copyrighted.

library, and Gabriel and the maid had been sent out. Ilse opened the door herself. A young man whose colored cap and black map under his arm proclaimed him a student, started back in surprise. He looked quite different from what she expected, being without ostrich feather or sword, and his face was pale and thin; yet Ilse felt respect for the learned young man, at the same time dreading that the rude nature of his class might suddenly break out. She was, however, a brave woman and took a practical view of the visit. As long as the misfortune has come I must be courteous. "You wish to speak to my husband; he is not at home at present. Will you have the kindness to walk in?"

The student, a poor philologist who was a candidate for a scholarship, was thrown into great alarm at the majestic being who stood before him. He made many bows and did not venture to refuse. Ilse took him into the parlor, motioned him to an arm-chair and asked whether she could be of any service to him. The poor wretch became still more embarrassed and Ilse was also infected by his discomfiture. She made an effort, however, to begin a conversation, and inquired whether he belonged to the city. This was not the case. From what country did he come? she also was a stranger. He proved to be from her own province—not indeed close to her home, but within ten miles from it; he had, therefore, from his earliest youth looked on the same mountains and knew the dialect of her country and the voices of the birds. Now she moved nearer to him and made him converse, till at last they chatted together like old friends. At length Ilse said: "My husband will perhaps not return very soon; I should not like to deprive him of the pleasure of seeing you. How would it be, my countryman, if you would give us the pleasure of being our guest to dinner next Sunday?"

Surprised and with expressions of thanks the student arose to take leave and was accompanied to the door by Ilse. But he had been so confused by the adventure that he had forgotten his portfolio. Again he rang the bell diffidently; again he stood embarrassed at the door and with many excuses asked for his portfolio.

Ilse was pleased with this meeting and with having so well overcome her first difficulty. She called out joyfully to her husband when he came to the door, "Felix, the first student has been here."

"Indeed," answered the husband, in no wise disturbed by the announcement; "what is his name?"

"I do not know his name, but he wore a red cap and said he was not a freshman. I was not at all afraid and I asked him to dinner for Sunday."

"Well," replied the Professor, "if you do that to everyone our house will soon be full."

"Was it not right?" asked Ilse, troubled. "I saw that he was not one of the principal ones, but I wished, on your account, to do too much rather than too little."

"Never mind," said the Professor; "we will not forget that he was the first one to look into your dear face."

Sunday came, and with it, at the hour of noon, the student, who had on this occasion paid exceptional attention to his toilet. But Ilse, observing the demeanor of her husband toward the student, maintained a quiet, motherly dignity. In accordance with this she gave him a second helping of the roast and provided him with quantities of vegetables. This kindly treatment and several glasses of wine, the last of which was poured out by Ilse, strengthened the heart of the student and raised him above the petty things of earthly life. After dinner the Professor conversed with the Doctor on some learned subjects. But Ilse kindly kept up a conversation with the young gentleman and put him so much at his ease that he began to speak of his family affairs. Then the student became confiding and pathetic and began some very sorrowful disclosures. In the first place, naturally, that he had no money; then he ventured to add the painful confession of a tender attachment for the daughter of a lawyer who lived in the same house with him, and whom he had secretly worshiped for a whole year and expressed it in poetry. But at last the father interposed; he, with a tyranny peculiar to magistrates, forbade the acceptance of the poems by his daughter and contrived to remove the student from the house. Since that time the heart of the student had been an abyss of despair; no longer did any poem—they were sonnets—penetrate to the secluded beloved one. Nay, he even had grounds to believe that she too despised him; for she attended balls, and only the previous evening he had seen her with flowers in her hair alighting from her father's carriage at a brilliantly lighted house. Sorrowfully he had stood at the door of the house among the spectators; but she had glided past him smiling and beaming. Now he wandered about in despair and alone, weary of his life and full of dismal thoughts, concerning which he gave gloomy intimations. Finally, he asked Ilse's permission to send her these poems which expressed the condition of his heart. Ilse, of course, consented, with expressions of sincere compassion.

The student took his leave and the next morning Ilse received a package with a very respectful letter, by post, in which he excused himself for not sending her all the poetical pieces which would place his misfortune in the right light, as he had not copies of them ready. Enclosed with them was a sonnet to Ilse herself, very tender and full of reverence, in which it was clearly the secret intention of the student to make Ilse the mistress of his dreams in the place of his unfaithful love.

Ilse, somewhat embarrassed, laid this enclosure on the writing-table of her husband.

"If I have done wrong, Felix, tell me."

The Professor laughed.

"I will send him back his poem myself; that will cool his ardor. You know now that it is dangerous to receive the confidence of a student. The poems, by the way, are poorer than need be."

"Thus I have had a lesson," said Ilse, "which I have brought upon myself; for the future I will be more cautious."

But she could not so easily banish the recollection of the student.

Every afternoon, when the weather was favorable, Ilse went at the same hour with her husband to the adjacent wood. The happy couple sought out lonely by-paths where the branches were more thickly intertwined and the green carpet beneath contrasted gaily with the yellow leaves. Then Ilse thought of the trees on her father's estate; and the conversation with her husband always reverted to her father, brothers and sisters and to the latest news she had had from home. In the meadow which extended from the last buildings of the town to the wood there stood a bench under a large bush; from there could be seen the hostile houses in the foreground and behind them the gables and towers of the city. When Ilse came upon the place the first time, she was pleased at the sight of her own windows and the surrounding gloomy towers, and it led her to think of the seat in the cave from which she had so often looked on her father's house; she sat down on the bench, drew out the letters which she had just received from her brothers and sisters, and read to her husband the simple sentences in which they reported the latest events on the estate. From that time forth this became her favorite resting-place, as she and her husband bent their steps homeward.

The day after the reception of the student's package, on arriving at the bench, she saw a small nosegay lying on it; she picked it up with curiosity; a delicately folded note of rose-colored paper was appended to it, with this inscription: "A greeting from B." After this as many stars as there were letters in the name of her father's country-place. Surprised, she handed the note to the Professor. He opened it and read these unpretentious lines:

The little dwarf in his stone-built bower,  
Has written the rhyme on this card.  
He sends from your father's home a flower,  
With his heart-felt, most cordial regard.

"That is meant for you," he said, in astonishment.

"How delightful!" exclaimed Ilse.

"The '*dwarf*' must certainly be a joke of the Doctor," decided the Professor; "truly, he has well disguised his handwriting."

Ilse, delighted, pinned on the nosegay.

"When the Doctor comes this evening he shall not find out that we have discovered him."

The Professor dilated upon the droll idea of his

friend and Ilse, who before had looked upon the Doctor with secret distrust, heartily agreed.

But when, in the evening, the Doctor feigned the greatest nonchalance, he was jestingly scolded for his art of dissimulation and loaded with thanks. When, however, he firmly declared that the nosegay and verse did not come from him, fruitless discussion arose as to the author, and the Professor began to look very serious.

A few days later the offering in the wood was repeated; another nosegay lay on the bench with the same address and a verse. Again did Ilse endeavor gently to maintain that there had been collusion on the part of the Doctor, but the Professor rejected that and put the rose-colored note in his pocket. Ilse took the nosegay with her, but this time did not place it in her girdle. When the Doctor came the adventure was again discussed.

"It can be no one but the little student," said Ilse, much distressed.

"That I fear, also," said the Professor, and related to the Doctor Ilse's annoyance at the confidential package from the son of the muses. "Harmless as the thing appears in itself, it still has a serious aspect. These addresses imply close watching, which is anything but agreeable, and such activity and assiduity may lead the adorer to still greater daring. He must be checked. I will endeavor to-morrow to convince him of his error."

"And if he should deny the act," interposed the Doctor. "You should at least make this impossible. As the nosegay has escaped the observation of others passing by, it has probably been laid there the last moment before your appearance, which would not be difficult to do, as you always pass at the same hour. We must endeavor to surprise the daring man."

"I will go alone to-morrow," said the Professor.

"You ought not to watch a student in the wood," said the Doctor, decidedly. "Besides, if your wife remains at home the nosegay will probably not lie on the bench. Leave the affair to me. Go out as usual to-morrow and the following days and I shall watch the place from some other point."

This being settled, the Professor took both the small nosegays from the glass and threw them out of the window.

On the following day, a quarter of an hour before his friends started, the Doctor went to the wood, disguised in a grey coat and dark hat, in order to fall upon the presumptuous versifier from his hiding-place; he undertook to chastise the offender so that the Professor would be spared any personal interference. He found a good place just opposite the bench, where the dense beech foliage would conceal the hunter from his game. There he placed himself in a good position, drew a large opera-glass from his pocket and fixed his eyes incessantly on the bench in question. The bench was still empty;

the few pedestrians passed it by with indifference; the time seemed long; the Doctor looked for half an hour through the glasses, so that his eyes began to ache, but he persevered. His place was well chosen; the offender could not escape. Suddenly, just as his eyes accidentally glanced toward Herr Hummel's house, he saw the garden gate open; something dark passed out between the trees and came toward the bench out of the thicket, looked cautiously round, passed by the bench and disappeared again among the trees and through the hostile garden gate. An expression of infinite astonishment was depicted on the countenance of the Doctor; he closed his opera-glass and laughed quietly to himself; then directed the glasses again, peering after the vanished figure; shook his head and fell into deep thought. He listened and heard the quiet steps of two promenaders. The Professor and Ilse came out of the wood; they stopped a few steps from the bench and looked at the fatal nosegay which lay there so innocently. The Doctor burst out from the copse, laughing, took up the nosegay, and, offering it to Ilse, said:

"It is not the student."

"Who then?" asked the Professor, uneasily.

"That I cannot tell," replied the Doctor; "but the affair is harmless—the nosegay is from a lady."

"Seriously?" asked the Professor.

"You may depend upon it," replied Fritz, convincingly. "It is from some one whom we both know and your wife need not hesitate to accept the greetings. It is given with the best intentions."

"Have the townspeople so many verses and secrets?" asked Ilse, curiously, taking the flowers with a light heart.

Again there was guessing: they could not find any one on whom they could fix it.

"I am glad that the mystery is thus solved," said the Professor; "but tell your poetess that such missives might easily fall into bad hands."

"I have no influence over her," replied the Doctor; "but whatever may have put it into her head to do this, it will not always remain a secret."

At last came the long-wished-for hour in which Laura was to have a private meeting with the distinguished stranger, as Ilse up to this day was designated in the private memoirs. Her mother had gone out when Ilse entered the sitting-room to ask a household question. Laura gave the information, gained courage and at last ventured to request that Ilse would go with her into the garden. There they sat together under the last rays of an October sun and interchanged opinions concerning the boat, the Chinese temple and the passers-by. Finally, Laura respectfully took Ilse's hand and drew her into a corner of the garden in order to show her a great rarity—the abandoned nest of a hedge-spar-

row. The birds had long flown away and the remains of the nest still hung on the half-bare branches.

"Here they were," cried Laura, impressively; "charming little creatures; there were five speckled eggs there and they reared their little ones successfully. I was in mortal terror all this time on account of the cats that prowled about here."

"You have never lived in the country," said Ilse. People here in the city are delighted if they can only keep one poor little sparrow in their garden. At home they chirruped, sang and flew about in all the trees; and unless there was something unusual about one of them, one took no particular notice of them. Here each little creature is valued and cared for, even the sparrows. The first morning I was here I was shocked at the sight of these poor creatures; they are not to be compared to their brothers in the country, their feathers are so bristly and uneven, and their whole bodies are black and sooty, like charcoal-burners. I would gladly have taken a sponge to wash the whole lot."

"It would be of no use; they would become black again," said Laura, despondingly. "It is caused by the soot in the gutters."

"Does one become so dusty and is one so roughly handled in the city? That is sad. It is certainly much more beautiful in the country." As Ilse softly acknowledged this, her eyes moistened involuntarily with the thought of the distant woody hills. "I am only a stranger here," she added, more cheerfully. "The city would be very pleasant if there were not so many people; they annoy me with their staring, whenever I go out alone."

"I will accompany you if you like," said Laura, delighted; "I shall always be ready."

This was a kind offer and was thankfully accepted. Laura, in her great joy, ventured to ask Ilse to go with her into her private room. They ascended to the upper story. There the little sofa, the ivy screen, the shepherd and shepherdess, were duly admired, and finally the new piano.

"Will you play something for me?" asked Ilse. "I cannot play at all. We had an old piano but I learnt only a few tunes from my dear mother for the children to dance to."

Laura took a piece of music, the first leaf of which was beautifully ornamented with gilded elves and lilies, and played the "Elfin Waltz," secretly trembling, but with great execution; and she explained, laughingly, and shaking her black locks, the passages where the spirits came fluttering in and mysteriously chattered together. Ilse was highly delighted.

"How quickly your little fingers fly," she said, regarding Laura's delicate hand with admiration. "See how large my hand is in comparison and how hard the skin—that comes from doing housework."

Laura looked entreatingly at her. "If I might only hear you sing."

"I can sing nothing but hymns and some old country songs."

"Oh, do sing them," begged Laura. "I will endeavor to accompany you."

Ilse began an old melody and Laura tried a modest accompaniment and listened with transport to the rich sound of Ilse's voice; she felt her heart tremble under the swelling tones and ventured to join in the last verse.

After this she searched for a song which was known to both, and, when they succeeded tolerably in singing together, Laura clapped her hands enthusiastically, and they determined to practice some easy songs in order to surprise the Professor.

In the course of conversation Ilse confessed that she had seldom heard a concert, and occasionally when visiting in the neighborhood, had seen a play, but only one opera.

"The piece was called the *Freischütz*," said Ilse; "the heroine was the forester's daughter, and she had a friend just as merry, with beautiful locks and frank eyes like yours; and the man whom she loved lost his faith in the gracious protection of heaven, and in order to obtain the girl he denied God and surrendered himself to the Evil One. That was fearful; her heart became heavy and a foreboding came over her; but she did not lose her strength of mind, nor her trust in help from above; and her faith saved her lover, over whom the Evil One had already stretched out his hand."

Then she accurately described the whole course of the action.

"It was enchanting," she said. "I was very young, and when I came back to our lodging I could not compose myself and my father was obliged to scold me."

Laura listened, sitting on a footstool at Ilse's feet; she held her hand fast and heard her account as a little child listens to a tale she already knows.

"How well you describe it; 'tis as if one was reading a poem."

"Ah, no," exclaimed Ilse, shaking her head; "this compliment is just what I do not in the least deserve. I have never in my life made a verse and I am so prosaic that I do not know how my unpolished nature will adapt itself to the town, for here they write verses; they hum about in the air like flies in summer."

"What do you mean?" asked Laura, hanging her head.

"Only think, even I, a stranger, have received verses!"

"That is quite natural," said Laura, folding her handkerchief in order to conceal her confusion.

"I have found little nosegays on the bench in the park, with dear little poems, and the name of my home given by a letter and stars. See, first a large B, and then—"

Laura, in her delight at this account, looked up from

her handkerchief; her cheeks were suffused with color; there was a roguish smile in her eyes.

Ilse looked at the beaming countenance and, as she spoke, guessed that she was the giver.

Laura bent down to kiss her hand, but Ilse raised her curly head, threatening her with her finger and kissing her.

"You are not angry with me," said Laura, "for being so bold?"

"It was very sweet and kind of you, but you must know that it caused us a great deal of uneasiness; the Doctor discovered you, but he did not tell us your name."

"The Doctor?" exclaimed Laura, starting up. "Must he always interfere everywhere!"

"He kept your secret faithfully. Now I may tell my husband all about it, may I not? but, between ourselves, he was very much displeased for a time."

This was a triumph for Laura. Again she seated herself at Ilse's feet and archly begged her to relate what the Professor had said.

"That would not be right," answered Ilse, gravely; "that is his secret."

(To be continued.)

## THE OPEN COURT,

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT. DR. PAUL CARUS, EDITOR.

THE OPEN COURT is devoted to the work of reconciling Religion with Science. The founder and editor have found this conciliation in Monism—to present and defend which is the main object of THE OPEN COURT.

THE OPEN COURT has for contributors the leading thinkers of the old and new world.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social and economic questions.

TERMS, \$3.00 PER YEAR. SINGLE COPIES, 10 CTS.

All communications should be addressed to

THE OPEN COURT,

P. O. DRAWER F. (Nixon Bldg., 175 La Salle St.) CHICAGO, ILL.

## MONISM AND RELIGION.

A REPLY TO "THEOPHILUS," BY E. P. POWELL.

The discussion opened by D. Theophilus seems to me to be so vitally important that it should not be allowed to rest. Is he correct in the general statement of facts? Let me number them so as to cover, to at least a just degree, the scope of the able essay:

(1.) There is no warrant for the statement that there is no antagonism between science and religion, which involves that there is an essential antagonism between religion and science.

(2.) Wherever and whenever in the world's history there arose a science, distinctively formulated, it invariably and inevitably clashed with religion.

(3.) With the scholastics originated the idea of reconciling religion and science.

(4.) Having by means of scholasticism won a position, science was not long in claiming for itself the sole authority over the nature of knowledge.

(5.) The fall of scholasticism led to a separation of science and religion (once more).

(6.) All subsequent efforts at reconciliation have failed in like manner.

(7.) Religion is not an ultimate fact of human nature. It is not a fact for Strauss.

(8.) Religion rests on a belief or a knowledge concerning an object, intelligent and supreme, analogous to the human, a personality possessing a will and power to control human destiny, and other than nature. With this is conjoined an emotion of fear, awe, love, etc., followed by acts of worship.

(9.) Such was the idea of religion to all minds until the present century; and only of late has there been an endeavor to seek some other foundation in human consciousness than the old one.

(10.) This effort is futile, for religion rests on dualism and postulates an anthropomorphic God as an indispensable condition of its existence.

(11.) The Infinite, the All, etc., fail to give meaning and life to religion. People would be as likely to worship the All as they would a tomcat or an Egyptian mummy. "Banish dualism from your head, and religion will necessarily vacate the heart."

This is, I believe, a just and complete summary of his argument, placed in such a form that it can be dealt with without confusion. It matters not what may be

the purport of this argument, whether to defend dualism or to undermine monism, or neither. I believe it involves erroneous statements of facts; but more vitally erroneous conceptions of the relations and bearings of facts. Inaccuracy of definition is also not absent, notwithstanding an apparent effort at demanding precision of others. The trend of science has of late been so positively constructive of a monistic theology, or logic of the universe, vital as well as material, psychical as well as physical, that the assertions of this essay cannot be justly or wisely overlooked. Especially does monism find it essential to take up the glove at the declaration that dualism is the only basis for religious sentiment. Had the statement rested at the affirmation that some modification of anthropomorphism seems essential to any conception of a lovable and worshipable being, the challenge might have been overlooked, as comparatively non-essential. But we must have, it appears, not only anthropomorphism in perception, but dualism in conception.

Not, however, in any way to anticipate the points made, let us begin with No. 1: "There is an essential antagonism between religion and science." On the contrary no religion exists to-day, or ever did exist, which was not essential science. Involved in the earliest phases of religion were the scientific conceptions of the day. The Vedas are full of it. Egyptian religion was an explanation of the universe. About 2000 B. C. the whole Brahmanic and Zendavistic theology had taken shape. Its basis was science; its development was ritual of service and worship. The creation is not an accidental beginning of the Hebrew Scriptures, it is the very core and soul of the whole Hebrew and Christian faith. The explanation of things, the How and Why of the universe is the essential starting point of faith; and faith never escapes its originating impulse. The New Testament exists because of the Old. Man was made by God; we fell from righteousness; hence the need of a Redeemer; and so you get the whole scheme of salvation. Remove the science at the foundation, and the system topples at once. The believer must stand by Adam and the Creator *extra naturam*, or he will have to give up his atonement and his heaven and hell. This is true in essential measure of all religions known. Cause was the one all-demanding problem; the cause of what appeared; and above all the final cause. The

sum of all theology, and the basis of all religious sentiment is to-day the cause of causes—the final cause—the God.

With point No. 2 we need not so essentially clash, "that wherever and whenever in the world's history there arose a science, distinctively formulated, it invariably and inevitably clashed with religion." But very plainly the bearing of this statement is wholly reversed by what we have stated under No. 1. The conflict is inevitable, because the rise of a new science is in the face of an existing science. A science, involving theology, being in the field, any new science or evolution of science must conflict with it. So, then, our new statement is, that there is a conflict between two sciences. If you can possibly invent a science absolutely involving no doctrine of causes, or cause, or cause of causes, you will have not the least conflict with theology. But this is impossible. Each and every increment of scientific knowledge modifies our ideas of causality. So that the theologian of to-day is compelled to say it is our final duty "to push the cause of causes as far back in nature as possible." But monistic science, that is, the science of evolution, pushes him out altogether. Let us look over history. The Vedic or Brahman in evolution was a new scientific outlook, and we have evidence of a fierce conflict back there, 2000 B. C., among our Aryan fathers in Central Asia—a struggle that reached out and involved to the west, the Shemites. About 1500 B. C. occurred another great evolution, that which gave to the world the Mosaic code, the laws of Manu, and the laws of Tschon in China. But this was an unfolding of law, or a codification of morals, and hence there arose no conflict whatever. Religion endures new moral frontages; but to new scientific frontages it takes affront. 1000 B. C. was a marked moral evolution of Homeric and Davidic song, but no new science. The old was sung into rich spiritual life among the Shemites; and into poetic softening of brute force conflict among the Aryans. But 500 B. C. was the age of Buddha, Confucius and Socrates. At the great centers of civilizations science promulgated new views of the universe, and they could stand only by the downfall of the old system of cause and causes. The old Gods were assailed not as religious beings, but as scientific causes. "Are there 30,000 Gods?" they asked of Buddha. If there are let them alone, was the essential reply. Confucius and Socrates gave almost identical answers in spirit.

I might trace the same historic periodicity of evolution, and show that at well rounded periods since Jesus, knowledge has accumulated, so as to confront the old science with a new system of explanations. These evolutions culminated in battles of the orthodox old with the heretical new. About 500 A. D. came the culmination in a Papal power; 1000, in the absolute Hierarchy. But about 1500 the seething of new facts and a widen-

ing outlook caused the great struggle of the Reformation. Was this a simple struggle of theologies, or the ritualistic outgrowth of sciences? You will find it was no such thing. Calvinism is a reconstructed science, and logic of asserted scientific facts. The Westminster Catechism, and all other Calvinistic fulminations, are efforts to explain the universe and man as the thing of a Creator. That the present struggle is not one of science with theology is certain; but it is a confronting of cosmologies and geologies and anthropologies, and only therefore of theologies. It is simply a question whether we are bound to believe the scientific conceptions of 2000 and of 4000 years ago, or those of to-day,—the latest research; and whether our worship should be of a Being implied in primitive science, or of Being as implied in modern science.

But (3) "with the scholastics originated the idea of reconciling religion and science." This is to ignore all the struggle of the Jewish Rabbis before Jesus, of the Greek philosophers, of the Buddhistic school of commentators. The facts are that each great unfolding of science (religion) has led to a school of reconciliation; and history has been everywhere as full of the pacifications as of the conflicts; the harmonizing as the antagonizing. Of course the unfolding of cosmology that began with the heliocentric conception of the universe, was such a revolution, that from Galileo down it was more and more evident that the old cosmology must perish or compromise. The Mosaic days expanded, and Yahweh's sabbatic rest was broken, until there was nothing left but a din of clashing arms. Was it science against theology? It was modern science battling with ancient science, and the voices of reconcilers piped over the field of battle like bobolinks over a charge of cavalry.

The fourth point amounts simply to this, that the new or heliocentric cosmology began to win its way. No. 5 asserts that the scholastic harmonizers yielded the field essentially. No. 6 asserts that later and more scholarly efforts at reconciliation, such as that of Dr. Chalmers and Hugh Miller, with that of Dr. McCosh, and "orthodox evolutionists" have failed.

No. 7 demands our next serious consideration. "Religion is not an ultimate fact of human nature." At this point it is quite essential to do what I have avoided heretofore, define religion. In the article of Theophilus there is a confusion in the use of this very all-important word. It is used at one time to include historic theology; at another, to cover only the rational sentiment or feeling that follows theological belief. If by religion is meant the former, that is, historic theology (that is, science applied to cause and causes), it is clear that every mind must have a religion; and Strauss is no more an exception than Talmage. Indeed, in proportion as a brain is logical, cultured and informed, it must have the

religion of causality. Talmage in that sense has not one-millionth part the religion of Strauss, or Renan, or Thomas Jefferson, or Count Cavour, or John Stuart Mill. But if by religion is meant the sentiment of honor, awe, reverence, or worship that arises in a well informed mind, then again religion is an ultimate fact of human nature. For I take it Theophilus will not deny that when a Persian kissed his hand to a star, he had an emotion, growing out of his knowledge of the universe, toward the cause, or cause of causes, involved. The implication that this ultimate fact is outgrown by any one is disposed of when you come to a correct definition of religion. The only fact (ultimate or otherwise) outgrown, is the childish methods of expressing feeling.

No. 8 is Theophilus's own effort at a definition of religion; that is, "it is a belief or a knowledge concerning an object, intelligent and supreme, analogous to the human, a personality possessing a will and power to control human destiny;—and other than nature;—conjoined with an emotion of fear, love, etc.; followed by acts of worship." This is simply a very rigid description of the dualistic conception of a Being extra-natural, such as might be very nearly given by Cardinal Newman or Professor Diman. It does not rest with saying religion is a belief in a cause or cause of causes; but it goes on to such a definition of religion that we are driven to the conviction that Socrates, Buddha, and the ancients in general, had no religion at all—so far as they were not monotheists. This no one should grant. Religion is rather, so far as knowledge is concerned (or belief), the conception any mind may have of cause in the universe, or above the universe. His assertion that such belief is followed by emotions stands true. No. 9 affirms that "this historic interpretation of religion has never been questioned until the present century, and that only of late has there been an endeavor to seek some other foundation in human consciousness, which science cannot undermine." So far as this is intended to be a denial of any attempt to escape dualism, until almost the present date, it is to overlook Lucretius and Aristotle and Spinoza and the early Kant (the real Kant); but it is not in bounds to discuss this statement. We are concerned mainly with Nos. 10 and 11, which assert the utter futility of any effort to escape dualism without a total wreckage of religion. Certainly Theophilus does not mean that we cannot either know or believe concerning the universe, and its phenomena and causes, or causality in general, without dualism. At least our modern knowledge is monistic. That is, the primal fundamental thought of modern knowledge is unity of the universe. Except for theological purposes men of information have wholly given over all thought or speech of nature, except as one,—the universe, the absolute unit. Science and philosophy alike, and in common with our humblest household talk, considers practi-

cally an infinite universe, involving all of causality in itself. I do not mean that dualism is dead; but it has no longer any part in the growing conception of nature. The revelations of the spectroscope, combined with those of the telescope, have been supplemented by the investigations of evolution, showing a vital substantiality, as certain as a material, immanent in all nature.

But how is it about the other side of religion, the emotion, the feeling, the awe, the reverence, and the consequent worship? Clearly it is at this point that Theophilus intends to say: "No vague somethings or nothings will answer the purpose. People would be as likely to love, fear or reverence 'The All' as they would a tomcat." Unfortunately under dualism tomcats were worshiped; and ideas more vengeful and malevolent are embodied in the common conceptions of dualism than any tomcat ever manifested. If Calvin had done no worse than exalt an infinite tomcat, we might at least have stroked his fur to have escaped his claws.

But the question is a pertinent one, what principles were ever involved in the infinite final cause *apart* from nature, that are not equally involved in the universal causality *within* nature? It is more and more palpable to those deepest in investigation that nature is a continuous adaptation of means to ends; and while there is no reason for believing in a Designer above and outside of nature, there can be no conception of nature apart from design. The design is persistent in nature, and not imposed from without. The era of reconcilers is fairly ending with men who speak of "pushing back" their first cause as far as possible; or, as a Bishop recently averred: "The world was fitted up for man's occupancy, with adequate means inherent, or *supplemented*, to meet all his needs." The God of supplements is the finality of dualism. But science stands here "a magnificent reign of life and law, that is unfolding year by year, and age by age, is but the pulsating presence of One, who is over all, through all, interpenetrating all." I assert that the drift of science is to affirm a universe charged with immanent divine purpose—a substantial vital universe, which is sensible, intelligent and ethical. "Looking backward we are led to universal, potential, absolute life, ever actualized in vital phenomena. Mind is what all processes involve as a substratum. Nothing is more absurd than the use of the word force as something blind, aimless and lawless. It is never, in any display of it, for one moment, anywhere, aught but the legal, volitional, purposeful direction of energy."

Are we to allow that there is in this conception of infinite, immanent, purposeful Being, no more reason for love, awe, fear and worship, than "in an Egyptian mummy"? What of good, or great, or lovable, or fearful is lost? Do we not stand related to cause and purpose quite as intimately as under dualism? But it is not

only logically possible, but historically true, that science is worshipful. The Darwinism which now controls our scientific thought is not the elder Darwinism that was absorbed in material data, but a later Darwinism, or evolution, that concerns itself with the science of data. And "science" is still "religion," as it always was. I have only to refer to Huxley's latest writings, to Tyndall's, to Professor Cope's, our most eminent American biologist, as well as Le Conte Abbott, and a host more. Science is worshipful; but instead of looking out into a limbo of the extra-natural for its worshipful object, it sees its manifested cause in nature; and in the highest manifestations it sees its true cause for adoration. Man is no longer the thing of a Creator, but the glorious presence of a moral and intelligent purposive causality.

I am aware that Theophilus shuts down his gates at the very entrance into the land of love, and hope, and religious feeling. He does well to snip off all discussion by an assertion. We have simply to deny his assertion. To go far beyond that would involve other articles rather than a brief extension of this one. I am content to rest at this point, with the counter assertion that monism alone can truly fill both head and heart; the former with knowledge, the latter with emotion.

#### KARL THEODOR BAYRHOFER AND HIS SYSTEM OF "NATURALISTIC MONISM."

BY EDMUND MONTGOMERY.

##### Part III.

Taking the sense-revealed or material universe to be the proper object of speculative investigation for the purpose of ascertaining the veritable nature of Reality or Being, we first wish to know of what this perceptible universe actually consists. Are the multifarious and diversely constituted bodies, which seem to compose it, integrant parts, differentiated and particularized from some pre-existent, all-involving totality? Or are they themselves complex structures made up of far more primitive and elementary units?

The answer given to this fundamental question determines at once the main course our further speculation must necessarily take. If we believe in a pre-existent supreme totality of Being, of which perceptible things are subordinate segregations, we inevitably land in Spinozism or some kindred mode of pantheistic Monism. If, on the contrary, we believe the perceptible things of our world to be graduated compounds of primordial elements we find ourselves, to a certainty, entangled in some kind of Atomism or Monadism.

The radical and far-reaching opposition of these two different ways of interpreting the origin of perceptible things is almost as old as philosophy itself. And to this day the schools are continuing to contend with one another on the same ground.

One would think that modern chemistry had placed

it beyond the shadow of a doubt, that perceptible objects are in all reality composed of primitive elements; and not segregated from a pre-existent totality of Being. But the unification of philosophical thought and scientific experience proceeds by slow and cautious steps; and we have here to follow its tentative efforts to establish logical consistency between different provinces of knowledge.

The atomic theory of matter, imported from Epicurus into modern speculation by Gassendi, adopted by Boyle and Newton, made to triumph in chemistry by Dalton, and in physics by Fresnel and Cauchy; this atomic theory sought and still seeks to explain the constitution of material bodies, and the manifold changes they are found to undergo, by assuming them to be composed of exceedingly minute, indivisible particles, moving in free space, colliding there in strict keeping with mechanical laws, and forming in consequence more or less coherent and relatively persistent groups or aggregates.

It is the logical tendency of this conception to reduce material particles to mere passive vehicles of mechanically imparted motion; which motion is thus held to be the true source of all activity or energy in nature. Translatory motion, transmitted through collision, is the only mode of activity allowable in logical keeping with the mechanical conception. And the ultimate elements, that are undergoing such motion, can, consequently, contain in themselves no intrinsic spring of activity. If the ultimate particles of matter were themselves capable of undergoing intrinsic changes, they could not possibly be simple or indivisible. Such intrinsic changes could nowise take place without the shifting of parts of such particles; and then these parts and not the particles themselves would be the veritable atoms. So we would have to go on *ad infinitum*, subdividing further and further the material substratum, without ever being able to come to ultimate elements, unless we suppose that at last particles are reached which are absolutely rigid or intrinsically unchangeable.

But a world consisting of rigid particles of matter would soon come to a complete standstill; for two rigid particles meeting in direct collision, with equal velocities, would altogether annihilate each other's motion. To save the mechanical world-conception from utter collapse, movable elements have themselves to be endowed, and are constantly endowed by mechanical physicists, with the intrinsic, non-mechanical spring of action, called elasticity; which inner faculty has to make good from occult sources the mechanical loss of motion otherwise inevitably incurred during direct and oblique collision.

Then, after all—if the mechanical universe is not to end in motionless stagnation—the ultimate moving particles cannot be conceived as rigid units passively shifted about by imparted motion; but must—in direct opposition

to mechanical presuppositions—be thought of as containing something *within* them, which renders them fit to re-impart an equivalent amount of moving energy, for that which would be mechanically lost through collision, if they were really rigid.

According to mechanical *theory* material particles should be absolutely rigid. According to physical *experience* they must be absolutely elastic. This is the dilemma to which mechanical physics finds itself actually driven in the material world alone, irrespective of any attempt on its part to derive mental phenomena from its mechanics of atoms. And such obvious *reductio ad absurdum* of its world-conception suffices to prove, that it must be a radically inadequate interpretation of Reality. Surely that matter which contains the "promise and potency" of everything in nature, has to possess very different qualifications for so exalted a mission.

The first great difficulty which lies in the way of an adequate interpretation of the material universe, is due to the essential contrast obtaining between the nature of what we call empty space, and that which materially fills it. Space unoccupied by matter seems to be homogeneous throughout, its entire being exhausting itself in mere extension. It is therefore boundlessly extensible and boundlessly divisible in conception, our thought encountering nowhere resistance on its voyage toward infinity one way or the other. But, with the appearance of matter in space, definite limits are at once imposed. Our thought cannot deal with such definite extension at will; but must accept the given limits as something it cannot transcend. Material bodies are certainly not boundless like space, nor are they geometrically determinable as we choose.

The question, however, still remains, whether the space thus occupied by matter is completely filled with it; and whether such matter is itself, like space, infinitely divisible or not. The Kantian philosophy, through its demonstration of the subjectivity of space-perception, and the phenomenal nature of material appearances in space, pointed out the way to a solution of this ancient and vexatious puzzle. It teaches, that what causes our individual space-perception to be filled with the content we call matter, cannot itself be conditioned by the properties of such perceptual space; which mental form of apprehension is only our own subjective mode of consciously taking in, or rather of consciously reacting against the influences emanating from the objective universe or world of things-in-themselves.

Having in the course of philosophical development become once for all clearly aware, that what we call material bodies are perceptual appearances, specifically aroused within our own consciousness by definitely constituted existents which are stimulating our sensibility, we desire to frame a logically and scientifically valid hypothesis concerning the absolute, non-phenomenal

nature of the sense-stimulating existents. What sort of Reality or Being can it be that has power to cause our individual space-perception to be thus filled with that specific content we know as the material universe? This exactly is the problem to be solved before we can legitimately escape from philosophical Agnosticism, and before we can expect to lay a sure foundation for naturalistic Monism. Whoever does not see his way to give positive information concerning the absolute, non-phenomenal nature of Reality or Being is, philosophically speaking, an Agnostic;\* and his Monism can be grounded only on faith, supported by plausible considerations; not on knowledge of the absolute state of things.

Kant himself, in his *Metaphysische Anfangsgründe der Naturwissenschaft*, made an effort to form an idea of the absolute nature of extra-conscious matter or the world-substance. To the *mechanical* conception of such matter he opposed what has since been named its *dynamical* conception. As Bayrhammer's construction of matter is based on Kant's dynamical considerations, and as it is becoming more and more evident that no true idea of matter can possibly be formed, regardless of a theory of cognition, it will be appropriate to give a rapid sketch of Kant's view.

He reasons that, though we become aware of bodily existence only in the form of figures within our own space-perception, yet during the direct perception of objects there is evidently something present, which constitutes an essential difference between physical or bodily existence and mere geometrical construction. This something is generally called matter, and must be considered the compelling cause of all percepts not originated by ourselves. Changes undergone by such matter are perceptively realized as motion; i. e. as the moving of the bodily figure within our space-perception. Matter, then, and its changes are the *object* of our space-perception, but are not *constituted* by any efficiency of our own. Space itself is an empty form; matter, on the contrary, a space-occupying existent. To occupy space, matter must necessarily possess resisting power; otherwise, with sufficient force, it would be possible to compress it into nothing. This resistance, which matter is capable of opposing to any encroaching motion, appears to us likewise as motion. Matter is therefore as such a source of motion, or a force-emanating existent. By dint of its repulsive force every one of its parts occupies space, or—what amounts to the same thing—it is continuously extended, though compressible to some extent. Elasticity is thus a fundamental property of matter. If matter were, however, possessed of repulsive force only, it could have no confining boundaries, but would disperse into infinite space. Consequently there must reside in

\*Philosophical Agnosticism is in no way directly connected with the prevalent religious Agnosticism, which professes not to be in possession of knowledge enabling it to decide for or against the existence of a personal Deity, and the possibility of individual immortality.

matter a force antagonizing repulsion. This force is called attraction. Matter is indeed out and out a product of the antagonizing tendencies of the force of repulsion and of that of attraction.

These are the essential tenets of Kant's dynamical interpretation of material existence. And not only philosophers, but eminent physicists such as Bosovich, Ampère, Faraday, Fechner and many others, have attempted, in various ways, to construct matter dynamically, by means of the mere play of forces, without the aid of any self-extended, bodily substratum.

Bayrhafer, on the other hand, does not attempt to eliminate substantial existence from the realm of absolute Being by reducing everything to mere force-irradiation. He seeks to identify such extensive force-irradiation with the intensively reacting individuality and substantiality of force-emanaing existents. He argues in the following strain:

The material universe lies open before us. All phenomena of nature emanate from it. It must therefore include in itself the essence of Being, in which the ideal and the real of our world are inseparably united. And so we actually find it. For every concrete perceptible being or thing consists of a union of subjectivity and objectivity; is in fact subject-object, or a center of interaction. The substratum of natural phenomena, usually called matter, is evidently replete with interacting efficiencies, which sensibly manifest themselves as attractions and repulsions of constituent parts.

Of course, it is understood that matter, as it mentally appears to us, is merely a phenomenal reflex of the interacting entities that constitute veritable or absolute Being. And it is therefore only through speculative analysis of material *phenomena* that we can arrive at a consistent conception of the ultimate existents and efficiencies which give rise to such phenomena. The ever-changing unification and dissipation of material objects within our subjective perception allows us to conclude, that Being, i. e. the existent which compels these objective appearances in our perception, is itself changeably composed of elements that stand in effective and mutable relations to one another. For an original manifoldness or plurality within Being necessarily presupposes an original plurality of Beings. If eternal and absolute Being were in verity a single, ever-identical existent, without intrinsic manifoldness and opposition, there could exist no reciprocal relativity of its parts, and consequently no effectuation and change, and thus no phenomenal world. It is indeed utterly unintelligible how manifoldness and opposition could possibly arise within a self-identical totality. Consequently eternal or absolute Being must be composed of contiguous elements, that through their various modes of interaction among one another are forming an articulated system of Being, whose perceptually reflected representation is the material universe.

These self-existent elements of Being have to be conceived as substantial; for mere extended form, devoid of substantiality or essence, would consist of nothing but empty space. If—as has often been done—the essence of matter be conceived as mere extension and divisibility, then matter would necessarily be composite *ad infinitum*. To assume with Spinoza and Kant the divisibility of the form without the divisibility of the essence is illogical; for how can there be form without essence; the two are ever inseparable. The matter which appears in perception being manifestly extended and divisible, it follows that it must be composite so far as its divisibility goes. But as it cannot be composite *ad infinitum*, it must consist of ultimate, simple and indivisible elements. This is the truth that underlies the atomic theory of matter. In speculative philosophy, however, the atom becomes a monad, i. e. an indiscerptible unit of Being constituting a center of interacting efficiencies. Leibnitz was philosophically justified in setting up a system of monads in opposition to Spinoza's single extended and thinking substance. His dictum: "There are composite beings, hence there must be simple beings," however much contested, remains irrefragable to this day.

(To be continued.)

#### THE CONDITIONS OF LIFE.\*

BY W. PREYER.

Part II.

Translated from the German by F. W. Morton.

All the numerous advantages which society confers on living beings in such a way that they become conditions of life, are yet of a different order and, though highly important, are of incomparably less significance than those factors which are indispensable to every organism for the mere preservation of activity. The former are only indirectly, the latter are directly necessary; the former may for a time at least be removed, the latter cannot be removed for a moment without the greatest injury to the living being; the former are secondary, the latter are primary in so far that these must be all fulfilled before those can exist at all. The *direct external conditions of life* are therefore fundamental. They are basic conditions. They are also much better known than those complicated conditions which are regulated by the relation of one organism to another.

First of all it needs no proof that by a removal of the air breathing ceases, and thereby life becomes extinct. Indeed, many languages have for "die" and "expire" the same word. It is entirely safe to assert that everything which lives, also breathes. *What does not breathe does not live.* By this, breathing must only be taken in the wider sense—not as it signifies respiration, but as it means the working over of the air received in the inner organism.

This air need not have, however, strictly the same composition as the atmosphere which actually surrounds the earth. Apart from all accidental constituents of air—those which are of no importance whatever for life—even the three essential gases of carefully purified, dry, common, atmospherical air are not all demanded. The little amounts of carbonic acid gas are necessary for plant life, but wholly superfluous for animal life; and indeed where these rise to a certain amount they are detrimental. This constituent is therefore not a condition of life for *all* organisms. The same is true of the *nitrogen* of the air. It can in many cases be supplanted by another indifferent gas, hydrogen, without perceptible injury; it can also be entirely eliminated from the air we breathe without producing injury to any organism. The third gas, on the contrary, oxygen, must not be wanting where living beings are to exist.

Numerous experiments tried on plants and animals and repeated observations in respect to men in mines and badly-ventilated places, have shown that the removal of oxygen or the supplanting of this gas by another inevitably extinguishes the flame of life. It is indeed not strictly necessary that as much oxygen should be present in the air as we actually find in it. There could, without the slightest injury to life, be more or less of this life-air in the gaseous sea which covers the earth. Moreover, the amount of oxygen—and this varies within wide bounds—confined in the water of the ocean, lakes and rivers may be considerably increased, and, at least in the cold season of the year, decreased without injury to life. But a certain quantity of oxygen is as indispensable to the life of organized bodies as it is to the burning of a taper.

Pasteur, it is true, has asserted that there are beings which live without free atmospheric or absorbed oxygen, beings upon which the air acts fatally. These are *anaerobias*, vegetable ferments, without individual motion, and *vibriones*, with individual motion.

But however carefully the experiments were made, however certain it was that every trace of atmospherical oxygen was excluded, every proof was wanting that oxygen was not constantly developed somewhere in the mass and that it was consumed by the tiny organisms. We may perhaps suppose that those lower forms of life can only use the active oxygen, that is, oxygen at the moment of its generation; while the other organisms require also the inactive oxygen which they transform in part into ozone. At all events, from the fact that fermentation processes take place whose ferments are living beings, which can live for a period with a complete exclusion of atmospherical air and multiply at the cost of the fermenting material, it cannot be concluded that there are living bodies which need no oxygen gas, and therefore do not breathe. It can only be provisionally concluded that the oxygen of the air, be

it the gaseous or that freed from water, is not indispensable to life for all living bodies at the same time

Why could not these *vibriones* consume the oxygen which they themselves set free, just as plants consume the oxygen of the same atmosphere into which they discharge the oxygen developed by themselves? Are there not plants which in an enclosed space free from oxygen generate oxygen by day and again absorb it by night, and thus live for months? Water, sugar, tartrates, phosphates, which further the life of ferments, all contain much oxygen. Why could it not be set free from these by the *vibriones* as it is set free by plants from fixed chemical compounds that are rich in oxygen? In the same way this is true of the isolated living organs of higher organisms. If in a vacuum a muscle continues to twitch and the nerve preserves its sensibility, it does not necessarily follow from this that it consumes no oxygen.

No plants thrive without oxygen; no animals; and the more complex an organism is, the greater is its need of this life-gas. Its importance for life is fundamental. Thus the discovery of oxygen by Priestley, August 1, 1774, marks the beginning of a rational investigation of life, the beginning of modern physiology, whose corner-stone the discoverer himself laid when he recognized the great similarity between respiration and combustion.

Indispensable, moreover, as oxygen is to life, it has only one advantage over the other external conditions, viz., that its withdrawal—especially in the animal kingdom—very speedily brings the life-process to an end. As to the others, the second condition, viz., the presence of *water* in the immediate environment of the body, is of equal importance. The old chemical maxim, at first only conjectured but subsequently established over and over again by numberless facts, pronounced for living beings this law: *Corpora non vivunt nisi humida*: without humidity no life. Generally speaking dryness is the worst enemy of organized beings. The sterile, parched, reddish-yellow district in the heart of Sicily, before the rainy season begins, forms the strongest contrast with the bright green mantle with which spring adorns the Catanian fields.

The immeasurable importance of water for the development and maintenance of life is shown still more clearly in the animal kingdom than in the vegetable world with which it is inseparably linked. The sea is the cradle of animated nature, and its inexhaustible storehouse; from which come forth to the eye of astonished man ever new and still again ever new organic forms. It is at the same time the archive of the history of life, which even now preserves in its dark depths living witnesses, still unchanged, of long past periods. Even of the chalk period a few surviving forms have been found in it, which thus exist, at the same time fossilized and

living. On the other hand, wherever on the earth water is wanting, or in the air water-gas is not found, wherever from cloudless skies the sun sends down its scorching rays for months at a time on the thirsty earth, there plants perish, and even the stray animal tries with fleeting feet to escape from these dead regions.

The reception of oxygen is impossible without water. Never does an alkali unite with carbonic acid without water, if both are wholly dry. Much less can the numberless chemical unions in the bodies of animals and plants—in which for the most part material of much weaker power is found—take place without humidity. Therefore, there is no living body which does not continually receive water.

Not only must the medium in which the organism lives be constantly humid or wet, but—and here we come to the third condition of life—everything that is absorbed in the interior of the organism and everything that constitutes its nourishment, invariably contains water.

All animal and plant nourishment contains water. The wholly dry food materials, moreover, are less useful for the prevention of starvation, as are also the chemical elements of which they are composed. It is one of the characteristic properties of living bodies that they can under no circumstances continue to live when all the constituents of their nourishment are offered them in the elementary condition. Besides, it is impossible, so far as investigations have yet shown, for the simplest living being to assimilate the elements, unless they be already present in certain combinations, in the form of salts (sulphates, phosphates, chlorides), and in that of gases (carbonic acid gas) for plants, or in still more complicated combinations for animals. To these last, the albumen formed by the plants must be furnished already made, since they have not the power to assimilate these materials from the elements or simple combinations.

When we reflect, therefore, that animals are dependent upon plants which prepare for them the necessary food-materials from earth, air and water, we can comprehend that all animals and plants, and likewise all animal and plant foods, consist of the same elements; that the suckling is composed of the selfsame fundamental matter as the milk which he drinks, the deer of the same as the grasses which he transforms into flesh, and the bird of the same as the egg from which it has been hatched.

Thus these three external conditions of life may be brought together in this expression: A certain number of the elementary constituents of the earth's crust must be present in certain combinations and amounts in immediate proximity to the organism, so that it can assimilate these materials. The elementary substances which are indispensable to life are: *Carbon, hydrogen, nitro-*

*gen, oxygen, sulphur, phosphorus, chlorine, calcium, magnesium, potassium, sodium, iron,* and probably also *silicon and fluorine*. Of the remaining half hundred of the known chemical elements, none is found in the organism as a constant integral part or constituent. These, therefore, need not be received in the nourishment. The fourteen named suffice to produce the vast complexity of forms in animated nature, to make breathing, nourishment, growth, motion and perception possible. By the union and separation of these fourteen elements, nature aims to accomplish the wonders of life in all its past and present forms.

The principal three fundamental conditions of life, *oxygen, water and food* must, in order to be permanently useful for the maintenance of life, have several special qualities or properties. Above all these materials must have a certain temperature. *Without heat no life*. When the normal heat of a living body greatly decreases, its life ceases. Indeed, the process of animal life consists in a large measure in an unbroken generation of heat, namely, by a union of the received oxygen with the constituents of the food. But it is easy in all cases by merely cooling off the surrounding medium, water, air or earth, to overbalance the heat given off by the organism, and thus bring the thermal process, and with it life, to an abrupt end. How great the necessary minimum of heat must be, cannot be stated in general terms, but it must be specially determined for each separate case, and then again for each separate function. For all organisms in common, we may name as the lowest temperature at which the exchange of matter still continues, the freezing point of water. But this conjecture has reference to the inner temperature of the plant or animal body, not its environment. When the water in the body becomes ice life ceases, since the life process requires the fluid state of aggregation. There is no existing reason, however, why an idiothermic polar animal should not continue to exist in an atmosphere at zero, with nourishment at zero, and with water at little above zero. Nevertheless, this much is evident, that generally most organisms could not survive in a medium of permanent zero degree, and that in the warm season of the year, on the contrary, more forms of life will be developed than in the cold.

It is likewise difficult to determine the maximum heat which living beings can endure. It is only probable, that in a medium of 50° Celsius nothing living can prolong life and that the temperature of no organism could rise permanently above 46° without the greatest danger to life. Within these limits, probably all life is included.

In respect to the three primary necessities of life themselves, we may likewise inquire whether there be a maximum limit. Does death result from the reception of too much oxygen, too much water, or too much food?

Just as by the reception of too little oxygen suffocation results; of too little water, languor; or of too little food, starvation.

Generally, in plants the injuriousness of undiluted oxygen is proven. Among animals, likewise, death takes place quickly in oxygen gas of several atmospheres, although they retain life in pure oxygen gas of one atmosphere. When the reception of oxygen is artificially facilitated for animals a comfortable state of rest is induced, the motions of respiration cease, and an unfavorable result from this suspension of respiration to health is unknown. Moreover, a superabundance of water is, as is well-known, fatal to many plants; but whether there is an animal which perishes through immoderate drinking of water is to be questioned. By the too copious reception of food there is scarcely any living body which will lose its life if the food has only good constituents, for the receiving organs permit only an intermittent filling. There are animals which in a single day take as much food as they themselves weigh. Still it is not to be overlooked that by regular overloading the stomach with food-material injuries to health may arise. We must here also assume a maximum limit. But the danger of prostration or even of death from too much air, water or food, is much less than that arising from want of these necessary requirements, or the bad composition of the same.

Upon the whole, then, the immediate necessities of life are included within narrow limits. Others than the three named cannot be mentioned. Light, so important for the green plants, is in no wise necessary for all organisms without exception. Whatever lives in the greatest depths of the sea knows only night. Many entozoa in the dark inwards of higher animals, and larvae, in the interior of flowers and in the earth, are, likewise, in the same condition.

(To be continued.)

#### IDEALISM, REALISM AND MONISM.

The history of modern philosophy begins with Descartes, who, in search of a solid basis for philosophical knowledge, proclaimed the famous dictum: "*Cogito, ergo sum*," "I think, therefore I am." Descartes was convinced of the irrefutability of this sentence, which his contemporaries also considered a fundamental truth, and thus the belief in our existence, viz.: the existence of the thinking subject, became the corner-stone of modern philosophy.

Kant has proved that the conclusion of Descartes's syllogism is a fallacy. The existence of the *ego* which is arrived at in the conclusion *ergo (ego) sum*, is contained in the supposition (*ego cogito*). Accordingly, the fact to be proven is an assumption.

In spite of this mistake the *cogito ergo sum* of Descartes still remains the true starting point for philo-

sophical thought. The ego is the first and fundamental problem of all problems. Here is the spot to place the lever of philosophic inquiry. And indeed the ego has been from the beginning, and still is the subject of modern philosophy.

Descartes, who leads the van, assumed the existence of the ego as a fact. Kant, who closes the first epoch, and who marks at the same time the beginning of a new era of philosophical development, pointed out the logical fallacy in this syllogism. The chief work of Kant's philosophy is, as he styled it himself, to take the inventory of pure reason, which would contain and account for all the faculties of the thinking subject, and modern psychology proves that the ego of the old schools is a superstitious notion. The ego is no discrete entity, no eternal unit and thing in itself, but the result of a very complicated concurrence, a kind of co-operation of organic activity; it is the psychical expression of our whole bodily organism. To use Ribot's words: the ego is not a cause but an effect. The ego in the old sense of the term is a fallacy. It is the basis of dualism, and has been the source of innumerable superstitions.

Idealism is that conception of the world which takes the subject, the ego and its realm of ideas, as starting point. Modern philosophy since Descartes has, therefore, been called idealistic. Philosophic idealism since Descartes found a strong opposition in scientific tendencies, which followed their own direction and were developed almost independently of philosophic speculation. Accordingly philosophy and science were long considered antagonistic.

Realism is that conception of the world which takes the object, the real world and its phenomena, as starting point. As idealism assumes the existence of the ego, or the subject, so realism assumes the existence of things, or the objects.

Idealism as well as realism attempted to construct a philosophic system, consistent in itself and in harmony with the given facts of our experience. In their eagerness to reach this ideal both parties boldly ventured the conclusions which could consistently be drawn from their respective principles. Idealism hoped to realize a unitary and consistent conception of the world by declaring that the subject alone exists. Such idealists identified consciousness and reality and denied the objective existence of anything which lay beyond the ego. According to Berkeley the subject is the All, and in Fichte's philosophy the absolute ego is God. This exaggerated idealism is generally called spiritualism.\* Spiritualism explains the world solely from spirit, i. e. the substance of which the subject is supposed to consist. Matter does not exist, and what we call things are concepts of the subject.

\*Spiritualism is to be carefully distinguished from Spiritism in the popular acceptance of the word; this latter is Spiritism, or the belief in spirits.

Realism, on the other hand, identified objective existence (viz., matter) with reality, forgetful of the fact that many things (e.g. force, spirit, etc.) are real although they are not included in the term matter. Then realism declared that matter only exists; and matter was defined as the substance of which reality and the objects of our experience consist. This form of realism is generally called materialism. Materialism tries to explain all phenomena of the world, the phenomenon of consciousness included, from matter and from matter only.

Idealism, with some modifications which it suffered from the influence of the scientific notions of its time, developed the gigantic structure of a dogmatic system which was shaped and elaborated by Wolff, a German philosopher of great constructive ability. Realism, termed sensualism, by the English philosopher Locke, took the very opposite course of development. Baron Holbach, in France, formulated the conclusions of realism as a materialistic system, but the keen Scotch philosopher Hume, unable to account for the causal connection of phenomena, boldly pronounced his skepticism as the result of a philosophy which started from the assumption of realism. In materialism the unity of reality, the unity of the objective world which surrounds the subject, was lost. Cause and effect could not be considered as necessarily connected, but had to be regarded as two independent phenomena, and all we can say is, that according to our observation the effect has always followed the cause. Cause and effect form a synthesis, and the law of cause and effect, or the necessary sequence, cannot be proven.

Thus, in the course of time, idealism and realism had lost sight of one another, each finding itself hopelessly entangled in its own premises, the former as unwarranted dogmatism, the latter as desperate skepticism. Both had fulfilled their mission. They had accomplished all that they were capable of, but neither had attained the aim intended.

The progress to a higher stage of thought could only be effected through a reconciliation of both principles, and this task was accomplished by Kant, whose philosophy, as he himself professed, was a combination of Wolff's dogmatism and Hume's skepticism. Kant named his philosophy critical idealism. He might just as well have termed it critical realism, for Kant's philosophy is neither the old idealism nor the old realism, and, as expressive of the Kantian *method* of thought, the best name is undoubtedly *criticism*. Kant laid the foundation for a new conception of the world which in the course of the last half century was called monism, because it truly realizes the ideal of idealism as well as that of realism; it affords a consistent and unitary conception of the world.

Kant taught that only our sensations are real, things

are the creations of our minds,\* and our reason shapes the things out of the material of sensations, which is furnished by experience. Sensations by themselves, Kant says, are *blind*, the forms of pure reason are *empty*. Sensations which are not formed and orderly arranged by reason have no value, they cannot constitute knowledge; and speculative thought, if it dispenses with the reality of experience as afforded by sensation, is a vagary of pure reason and must be classed under one heading with hallucinations.

Kant was too honest in his inquiries to jump at conclusions or to anticipate the results of his philosophy. He was misunderstood for a long time. His system was admired for its labyrinthian intricacy of structure and derided for the same reason. He was both praised and blamed by men of the same and of opposite parties, in the one instance as the defender of the old dogmatism, and in the other, as the author of a systematized skepticism. He had thrown all philosophy into confusion. Everyone perceived that something of vital importance had happened, that a decisive victory had been gained. But as is often the case after a battle, the soldiers who were engaged in the fight did not know whether theirs was the winning or losing party.

The exposition of Kant's philosophy came from a quarter whence it was least expected, viz.: from the natural sciences. The natural sciences one by one confessed to have attained to the same results that had been anticipated in Kant's criticism, and thus the greatness of Kant was more and more recognized in the comprehensiveness of his radical and sweeping arguments.

Monism, which is the outcome of Kant's criticism, considers the world as one immeasurable, continuous whole, and in consequence thereof demands that a conception of the world must be consistent, free from contradiction, and in harmony with all facts. Monism accepts the view of idealism in so far as our knowledge of the world rests on and indeed is identical with self-cognizance. The true starting point of philosophy is still the *γινῶσι σεαυτόν* (know thyself) of the Delphian oracle. On the other hand it accepts realism. Reality, as it appears to our senses, is no mere sham; reality is the material, and, indeed, the only material out of which the lofty structure of our concepts and the whole conception of the world is built.

\*Albert Lange, in his *History of Materialism*, answers the question, "What is a Thing?" by the following concise statement:

"We give the name of *thing* to a group of phenomena which we conceive as one. In this definition remote relations and internal changes are not taken into consideration." And Professor Ludwig Noiré, accepting this view, adds (*Philosophy of Language*, p. 99):

"It follows undoubtedly from this definition that things have no existence for animals; for even the most extreme Darwinian will hardly venture to maintain animals to be capable of this."

"To men a tree is a single being or thing which grows from the root upward, and has a trunk and branches; but this is just what it can never be even to the most highly endowed ape that climbs about its stem and has accustomed dwellings and places of refuge under the well known leafy roof. It is beyond the limits of possibility that any monkey tribe should ever endeavor to take up a tree by the roots and plant it in another spot."

Monism rejects idealism in so far as it is spiritualism, viz.: in so far as it attempts to conceive of the world as a mere fiction of the imaginative faculty, in so far as it explains the world from a spiritual substance which is assumed to have an independent existence and to be the nature of the ego. According to monism, spirit independent of matter does not exist; and matter by itself, or a thing which is matter and nothing but matter, does not exist either. But both are real; both are names which express our notion of certain manifestations of reality.

Monism rejects realism in so far as it has become materialism, viz.: in so far as inert matter, and only matter, is made the principle of explanation for phenomena. Matter is one of our concepts abstracted from reality and science is still at a great distance from having formulated a correct conception of matter which will serve to account for all the phenomena of the so-called organic as well as the inorganic empire. Materialism it must be acknowledged is right in so far as it declares that all objective existences of reality are material, but materialism overlooks the importance of form. It is the form of things that makes them what they are and appear as they are. Matter alone will never be made to account for the problems of nature.

Thus in monism, both idealism and realism are reconciled, while spiritualism and materialism, representing the wrong conclusions of the one-sided assumption of idealism and realism, find their refutation.

#### HEAVENLY REST.

BY WM. SCHUYLER.

Good people struggle through this life,  
Hoping for Heaven's rest,  
Where there shall be no toil nor strife;  
But all be calm and blest;

Where all the saints who enter in  
Err not, nor ever could—  
Being, in perfect lack of sin,  
Machines for doing good.

But surely such a scheme as this—  
Pure goodness, nothing more—  
Turns an eternity of bliss,  
To an eternal bore.

#### CORRESPONDENCE.

##### INTERNATIONAL COUNCIL OF WOMEN.

JAMAICA PLAINS, MASS.

To the Editor of THE OPEN COURT:

I think THE OPEN COURT should have a word of the International Council of Women at Washington, for it was a remarkable instance of a council where the most perfect freedom of expression was allowed, and where the discussions were dignified and weighty, and must have a wide influence.

The speeches have so fully reported in the daily and weekly press, that it is not worth while to speak of them here. It was not so much the eloquence and ability of the speakers that

commanded attention as the importance of their subjects. Thus, the paper which received the highest compliment, the audience rebelling against the chairman stopping the speaker when her time was up, was a very solid, earnest plea for thoroughness in woman's preparation for the study of medicine, and it was evidently the clear presentation of the subject, and not any charm of rhetoric or pathos, which held the interest of the audience.

No meeting was more impressive than that devoted to social purity, and I believe every heart was impressed with the conviction that this was the great moral need of our time, and that a higher standard of character for both sexes could alone redeem our society from ruin.

The general tone of the meeting was unexceptionable, and was seldom marred by extreme statements or violent denunciations; while the religious character of the council was shown by the Sunday services, which began and closed it. They were marked by broad liberal spirit and freedom from sectarian antagonisms or bigotry. The Methodist and the Free Religionists found common ground in their interest in the welfare of humanity.

Another point of interest was the ability shown by many younger women not yet known to fame. They were the graduates of our high schools and colleges, and their work showed that the higher education of women during the last thirty years is beginning to bear fruit.

The attitude of the press, of the audiences, and of the community generally towards the council has been respectful and friendly (with few exceptions). All believed that the women came because they had earnest thought and purpose, and those who spoke, spoke of what they had seen and known. The very programme, in its list of subjects, was suggestive and instructive, and a great impulse has been given to thought and life throughout the length and breadth of the land.

The presence of the foreign delegates added greatly to the interest of the occasion.

#### BOOK REVIEWS.

SEA-SIDE AND WAY-SIDE. No. 1. *Julia McNair Wright*. Boston: D. C. Heath & Co. 1888.

This little book is unquestionably one of the best publications of its kind. It will be useful, not only as a reader, but also as a text-book of natural science for young children. The author believes that the first information imparted to a child should consist rather of scientific facts than trivial sentences, and has composed some lessons fresh from the sea-shore and the field where life is seen not in an abnormal state of captivity but in its own chosen home and natural sphere of development. In concise and strong Saxon language the child is told how Mr. and Mrs. Crab live at the sea-side, how the shell-fish lives, how the bees build their hives, etc. This new idea of a combined reader and text-book of natural science cannot fail to become an educative power of great value in the culture of the youthful mind.

The frontispiece of the *Art Amateur* for April, 1888, is an admirable wood-cut from A. Gilbert's etching of a portrait of Philippe Rousseau, the celebrated painter of animals and still life. We wish it were accompanied by a sketch of the artist's life, as we would like to know the true history of every one who adds new luster to a name so distinguished in French literature and art.

The talks on Japanese Art are continued, and we hope they will help to excite sufficient interest in the subject to secure the purchase of the admirable collection of Prof. Edward Morse for one of our leading art museums.

Theodore Child gives an encouraging account of the exhibition of the Philadelphia Academy.

Greta writes in her usual lively manner about art in Boston,

which unfortunately leaves on the mind the impression that she cares more for saying a smart thing than a true one.

Robert Jarvis gives the first part of an interesting article on Decorative Art, showing its high value, and illustrating the thorough work needed to do it justice, by a sketch of the life of Pierre Victor Galland, with engraved illustrations from his works.

The designs in this number are bold and free, and the colored print, representing cherries, is full and rich.

The Flash-light receives much attention in the photographic columns as well as the new subject of Keranography, or photographing by lighting.

A Dictionary of Furniture and Decoration, by M. Henri Harvard, is announced as at last ready. Mrs. Wheeler continues her talks about embroidery, and certainly if success can give claim, she has a right to speak as one having authority in the matter. Many useful, practical hints are given which make this magazine of great value to the student and amateur.

*Libertas* is the title of a German edition of *Liberty*, a Boston paper, which preaches Anarchism. The editors of *Libertas* are Mr. and Mrs. Schumm. The first three numbers show that the management is sober and judicious; their anarchism is not a dynamite revolution, but the more peaceful ideal of extreme individualism as is represented by Proudhon. While sympathizing with the work of the editors, we cannot agree with their views, and we doubt very much whether they will find a hearing among the German-American public. Germans as a rule are opposed to anarchism, and a few obnoxious individuals, such as Herr Most and his friends, have succeeded in making the very name odious.

The *Atlantic Monthly* for May contains a timely and fascinating article by Herbert Tuttle on "The Emperor William." It is remarkable how faithfully the author has portrayed the venerable hero of Sadowa and Sedan. Though not in style and comprehensiveness, but certainly in judgment and just appreciation, Herbert Tuttle's essay reminds us of the valuable labors of Carlyle.

Thought is deeper than all speech,

Feeling deeper than all thought;

Souls to souls can never teach

What unto themselves was taught.

—C. P. Cranch.

That very law which moulds a tear

And bids it trickle from a source,

That law preserves the earth a sphere

And guides the planets in their course.

—Rogers.

Comes a high-born thought this hour,

Let it from you never,

Till you have it in your power

Ever and forever.

If on duty's path you go,

And a sorrow press you,

Close with it as with a foe,

Fight it till it bless you.

—From the German of Scherer, translated by Mary Morgan (Gowan Lea).

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XIII.—Continued.

Thus an hour passed in pleasant talk till the clock struck, and Ilse rose hastily. "My husband will wonder where I have disappeared to," said she. "You are a dear girl; if you like we will become good friends."

Ah! that pleased Laura very much. She accompanied her visitor to the staircase, and on the step it occurred to her that she had forgotten her main point; her room was directly above that of the Professor's wife, and when Ilse opened the window she could communicate quickly with her by signals. Just as Ilse was about to close her door, Laura ran down once more in order to express her joy that Ilse had granted her this hour.

Laura returned to her room, paced up and down with rapid steps, and snapped her fingers like one who has won the great prize in a lottery. She confided to her journal her account of the whole consecrated hour, and every word that Ilse had spoken, and concluded with verses:

"I found thee, pure one! Now my dream will live.

And tho' 'twixt joy and pain thy soul may pine,

I touch thy garment's hem and homage give,

And lovingly thee in my heart enshrine."

Then she seated herself at the piano and played with impassioned expression the melody which Ilse had sung to her. And Ilse below heard this heartfelt outburst of thanks for her visit.

## CHAPTER XIV.

A DAY OF VISITS.

A carriage drove up to the door. Ilse entered her husband's study, attired for her first visits. "Look at me," she said; "do I look all right?"

"Very well," cried the Professor, joyfully, scanning his wife. But it was well that everything was as it should be without his help, for in matters of the toilet the critical eye of the Professor was of doubtful value.

"Now I begin a new game," continued Ilse, "such as the children used to play at home. I am to knock at your friends' doors and call out, Halloo, halloo! and when the ladies ask, Who is there? I shall answer, as in the game.

"I am a poor, poor beggar-maid,

And what I want is this:

For me I want a piece of bread;

For my husband I want a kiss."

"Well, so far as the kisses which I am to dispense to the wives of my colleagues are concerned," replied the Professor, putting on his gloves, "I should, on the whole, be obliged to you if you would take that business upon yourself."

"Ah, you men are very strict," said Ilse; "my little

\*Translation copyrighted.

Frank also always refuses to play the game, because he would not kiss the stupid girls. I only hope that I'll not disgrace you."

They drove through the streets. On the way the Professor gave his wife an account of the persons and the peculiar branch of learning of each of his colleagues to whom he was taking her.

"Let us visit pleasant people first," he said. "Yonder lives Professor Raschke, our professor of philosophy, and a dear friend of mine. I hope his wife will please you."

"Is he very famous," asked Ilse, laying her hand on her beating heart.

The carriage stopped before a low house at the further end of the suburb. Gabriel hastened into the house to announce the visitors; finding the kitchen empty, he knocked at the parlor door, and, finally, being experienced in the customs of the family, opened the entrance into the court-yard. "Herr and Frau Professor are in the garden."

The visitors passed through the narrow yard into a kitchen-garden, which the owner of the house had given his lodger permission to walk in, in order to get the benefit of the air. The couple were walking along the path under the noon sun of an autumn day. The lady carried a little child on her arm; the husband held a book in his hand, from which he was reading to his companion. In order, however, to do as much family duty as possible, the Professor had fastened the pole of a baby carriage to his belt and thus drew a second child after him. The backs of the couple were turned to the guests and they moved slowly forward, listening and reading aloud.

"An encounter in the narrow path is not desirable," said Felix; "we must wait until they turn round the square and face us."

It was some time till the procession overcame the hindrances of the journey, for the Professor, in the eagerness of reading, sometimes stopped to explain, as might be seen from the motion of his hands. Ilse examined the appearance of the strange pedestrians with curiosity. The wife was pale and delicate; one could perceive that she had recently left a sick bed. He had a nobly formed, intellectual face, about which hung long dark hair with a sprinkling of gray upon it. They had come close to the guests when the wife turned her eyes from her husband and perceived the visitors.

"What a pleasure!" cried the Philosopher, dropping his book into the great pocket of his coat. "Good morning, colleague. Ha! that is our dear Frau Professorin. Wife, unhitch me from the carriage, the family bonds confine me."

The unhitching took some time, as the hands of the mistress of the house were not free; and Professor Raschke by no means kept still, but struggled forward,

and already held fast with both his hands those of his colleague and wife.

"Come into the house, my dear guests," he exclaimed, striding forward with long steps, while Felix introduced his wife to the lady. Professor Raschke forgot his baby carriage, which Ilse lifted over the threshold and rolled into the hall. There she took up the neglected child from its seat and both ladies entered the room with a little specimen of philosophy in their arms, exchanging the first friendly greetings while the little one in Ilse's arms swung his windmill, and the youngest learned child on the arm of its mother began to scream. Meanwhile colleague Raschke went about clearing the room, removed books and papers from the sofa, shook faded sofa-cushions into form, which emitted a cloud of dust, and cordially invited his guests to be seated. "But how is this?" he said; "you are troubling yourself with this doll. Is it the baby? No; I see it is the other," he said, correcting himself, "which will be less troublesome."

At length the party seated themselves. Ilse played with the child on her lap, while Frau Raschke disappeared for a moment and came back without the screaming infant. She sat shyly by Ilse, but asked her friendly questions in a gentle voice; the lively Philosopher, however, was always interrupting the conversation of the ladies; he stroked the hand of the Professor, while he nodded to his wife. "This is quite right; I rejoice that you accustom yourself to our mode of life while still so young, for our wives have not an easy time of it—their outer life is limited and they have many demands made upon them at home. We are often wearisome companions, difficult to deal with, peevish, morose, and perverse." He shook his head disapprovingly over the character of learned men, but his face smiled with genuine pleasure.

The end of the visit was hastened by the baby, which began to cry piteously in the next room.

"Are you going already?" said the Philosopher to Ilse; "this cannot be counted as a visit. You please me much, and you have true eyes; and I see that you have a kind disposition, and that is everything. All we want is, in the face a good mirror through which the images of life are reflected fully and purely, and in the heart an enduring flame which will communicate its warmth to others. Whoever has that will do well, even if it is her fate to be the wife, as you are, of a sedentary student, and as is this poor mother of five screaming young ones."

Again he strode fidgeting about, fetched an old hat from the corner and handed it to the wife of his colleague. Ilse laughed.

"Oh, I see, it is a gentleman's hat," said Professor Raschke; "it belongs to your husband."

"I also am provided with one," said the Professor.

"Then it must be my own after all," said Raschke; and ramming the hat on his head, accompanied his guests to the carriage.

For some time Ilse sat in the carriage dumb with astonishment. "Now I have courage, Felix; the professors are still less alarming than the students."

"All will not receive you so warmly," answered the Professor. "He who comes next is my colleague Struvelius; he teaches Greek and Latin, as I do; he is not one of my intimate acquaintances, but is a thorough scholar."

This time it was a house in the city; the appointments were a little more ancient than in Ilse's new dwelling. This professor's wife wore a black silk dress, and was sitting before a writing-table covered with books and papers; a delicate lady, of middle age, with a small but clever face and an extraordinary coiffure; for her short hair was combed behind her ears in one large roll of curl, which gave her a certain resemblance to Sappho or Corinne, so far as a comparison can be made with two ladies of antiquity, the growth of whose hair is by no means satisfactorily ascertained.

Frau Struvelius arose slowly and greeted the visitors with stiff demeanor; she expressed her pleasure to Ilse and then turned to the Professor. "I have to-day commenced reading the work of colleague Raschke and I admire the deep thought of the man."

"His writings are delightful," replied the Professor, "because in all of them we perceive a thorough and pure-minded man."

"I agree in your antecedent and consequent in reference to this colleague, but as regards the general tenor of your sentence, I must remark that many works forming an epoch in literature would have no true claim, if it were necessary to be a perfect man in order to write a good book."

Ilse looked timidly at the learned lady who had ventured to oppose her husband.

"Yet we will come to an agreement," continued the professor's wife, fluently, as if she were reading from a book. "It is not requisite for every valuable work that its author should be a man of character, but he who truly has this noble qualification would be unlikely to produce anything which would have an unfavorable influence on his branch of learning; undoubtedly the weaknesses of a learned work originate more frequently than one supposes in the weakness of character of the author."

The Professor nodded assentingly.

"For," she continued, "the position which a learned man assumes with respect to the great questions of the day, affecting his branch of learning—nay, even the advantages and deficiencies of his method—may generally be explained from his character. You have always lived in the country," she said, turning to Ilse. "It would be

instructive to me to learn what impression you have received of the mutual relations of people in the town."

"I have met but few as yet," rejoined Ilse, timidly.

"Of course," said Frau Struvelius. "But I mean that you would observe with surprise that near neighborhood does not always call for intimate intercourse. But Struvelius must be told you are here."

She rose, opened the door of the next room, and standing bolt upright by the door, called out:

"Herr Professor and Frau Werner."

A slight murmur and the hasty rustling of leaves were heard in the neighboring room. The wife closed the door and continued:

"For after all we live among many and associate with only very few. In the city one chooses from among many individuals with a certain arbitrariness. One might have more acquaintance than one has, but even this feeling gives you confidence, and such confidence is more easily acquired in town than in the country."

The side door opened. Professor Struvelius entered with an absent-minded manner, a sharp nose, thin lips and also with an unusual head gear. For his hair stood so peculiarly after its own fashion, that we are justified in assuming that this head gear was hereditary and had given the name to his family. He bowed slightly, pushed a chair forward and seated himself in it silently—probably his thoughts were still occupied with his Greek historian. Ilse suffered from the conviction that the visit was an inopportune interruption and that it was a great condescension on the part of his wife to speak to her at all.

"Are you musical?" said Frau Struvelius, inquisitively.

"I can hardly say so," answered Ilse.

"I am glad of it," said the hostess, moving opposite to her and examining her with sharp eyes. "From what you appear to me, I should think you cannot be musical. This art makes us weak and leads too frequently to an imperfect state of existence."

Felix endeavored, with little success, to make the Professor participate in the conversation; and the visitors soon rose. On taking leave, Frau Struvelius stretched the under part of her arm in a rectangular line toward Ilse and said, with a solemn pressure of the hand:

"Pray feel yourself at home with us." And the words of her husband, bidding them adieu, were cut short by the closing of the door.

"What do you say now?" said the Professor, as they drove away.

"Ah, Felix, I feel very insignificant; my courage is gone, I would rather return home."

"Be composed," said the husband, consolingly; "you are going about to-day as if you were at a fair, looking

over the contents of the tables. What does not please you, you need not buy. The next visit is to our Historian, a worthy man, who is one of the good spirits of our University. His daughter also is an amiable young lady."

The servant opened the door and conducted them into the reception-room. There were some good landscapes on the wall; a pianoforte,—a pretty flower stand, with rare plants, well arranged and taken care of. The daughter entered hastily; she had a delicate face with beautiful dark eyes. A stately old gentleman with a distinguished air followed her. He looked something like a high official, only his lively way of speaking showed him to be a man of learning. Ilse was warmly and heartily welcomed. The old gentleman seated himself near her and began an easy conversation, and Ilse soon felt herself as comfortable as with an intimate acquaintance. She was also reminded of her home, for he asked:

"Are any of the remains of the old monastery at Rossau still preserved?"

Felix looked up with curiosity, and Ilse answered:

"Only the walls; the interior is rebuilt."

"It was one of the oldest ecclesiastical foundations of your region, and has stood many centuries, and undoubtedly exercised influence over a wide district. It is remarkable that the records of the monastery are almost all wanting, and all other accounts or notices, so far as I know, are very scanty. One may suppose that much still lies in concealment there."

Ilse observed how the countenance of her husband lighted up; but he replied, quietly:

"In the place itself my inquiries were in vain."

"That is possible," agreed the Historian. "Perhaps the documents have been taken to the seat of government, and lie there unused."

Thus passed one visit after another. Next came the Rector, a Professor of Medicine, an agreeable man of the world, who kept up an elegant establishment. His wife was a plump, active lady, with restless, inquiring eyes. Then came the Secretary of the theological Consistory, a tall, thin gentleman with a sweet smile; his wife, too, was over-proportioned in everything,—in nose, mouth, and hospitality. The last was the Mineralogist, a clever young man with a very pretty wife, who had only been married a few months. While the young women, seated on the sofa, were quickly becoming acquainted, Ilse was for the second time surprised by a question from the Professor:

"Your home is not without interest for my department. Is there not a cave in the neighborhood?"

Ilse colored and looked again at her husband.

"It is on my father's estate."

"Indeed! I am just now at work on a new discovery that has been made on your estate," exclaimed the Mineralogist.

He fetched a stone of remarkable radiated structure.

"This is a very rare mineral that has been discovered in the neighborhood of the cave: it was sent me by an apothecary of the province."

He told her the name of the mineral, and spoke of the stone of which the cave was formed, and the rock on which her father's house stood, just as if he had been there himself, and made Ilse describe the lines of the hills and the quarries of the neighborhood. He listened attentively to her clear answers, and thought the geological structure of the estate very remarkable.

Ilse was delighted and exclaimed:

"We imagined that no one in the world cared about us; but I see the learned gentlemen know more about our country than we ourselves do."

"We know, at least, how to find something more precious than fragments of rock there," replied the Professor courteously.

After their return home, Ilse entered her husband's room, who had already sat down to his work.

"Let me remain with you to-day, Felix; my head is confused with all the persons to whom you have taken me; I have seen so much within one day, and have had so much friendliness shown me by clever and distinguished men. The learned lady frightened me most; and, Felix, it is perhaps wrong in me to say so, for she is much cleverer and more refined, but I found a resemblance in her to a good old acquaintance."

"Frau Rollmaus," assented the Professor; "but this one is in reality very clever."

"Heaven grant," said Ilse, "that she may be equally true-hearted; but I feel terrified at her learning. I like the other ladies, but the husbands still better; there is something noble about almost all of them, they converse wonderfully well, they are unconstrained and seem to have real inward happiness and gladness of heart; and naturally so, for they hover over the earth like your gods of old, and, therefore, they may well be cheerful. And in spite of that there was the patched smoking jacket which the dear Professor Raschke wore—even moth and rust will not eat that! When I think that all these clever people have treated me with kindness and regard solely on my husband's account, I do not know how I can thank you sufficiently. Now that I have been thus received into this new society, I must ask that my entrance into it may be blessed."

The husband stretched out his hand and drew her toward him; she clasped his head with her hands and bent over him.

"What are you working at now?" she asked, softly.

"Nothing very important; merely a treatise that I have to prepare every year for the University."

He then told her something of the contents of the work.

"And when it is finished, what then?"

"Then I must be occupied in new tasks."

"And thus it goes on always from morning to evening, every year, till the eyes fail and the strength breaks," said Ilse, piteously. "I have a great favor to ask of you to-day; will you show me the books, Felix, which you have written—all of them?"

"All that I still possess," said the Professor, and he collected books and treatises here and there from every corner.

(To be continued.)

### RIDDLES.

My first, from the thief though your house it defends,  
Like a slave, or a cheat, you abuse or despise.  
My second, though brief, yet alas! comprehends  
All the good, all the great, all the learned, all the wise.  
Of my whole I have little or nothing to say,  
Except that it marks the departure of day.

Answer—CUR-FEW.

My first is the lot that is destined by fate  
For my second to meet in every State;  
My whole is by many philosophers reckoned  
To bring very often my first to my second.

Answer—WO-MAN.

'Twas whispered in heaven, 'twas muttered in hell;  
And echo caught faintly the sound as it fell.  
On the confines of earth 'twas permitted to rest;  
And the depth of the ocean its presence confessed.  
'Twill be found in the sphere when 'tis riven asunder,  
'Tis seen in the lightning and heard in the thunder.  
'Twas allotted to man from his earliest breath;  
It assists at his birth and attends to his death;  
Presides over his happiness, honor and health;  
Is the prop of his house and the end of his wealth.  
In the heaps of the miser 'tis hoarded with care;  
But 'tis sure to be lost in his prodigal heir.  
It begins every hope, every wish it must bound;  
It prays with the hermit, with monarchs is crowned.  
Without it the soldier, the seaman may roam;  
But woe to the wretch that expels it from home.  
In the whispers of conscience 'tis sure to be found;  
Nor 'e'en in the whirlwind of passion is drowned.  
'Twill soften the heart, but though deaf to the ear,  
'Twill make it acutely and constantly hear.  
But, in short, let it rest, like a beautiful flower;  
(Oh breathe on it softly) it dies in an hour.

Answer i—THE LETTER H.

The beginning of eternity, the end of time and space;  
The beginning of every end, and end of every place.

Answer i—THE LETTER E.

Formed long ago, yet made to-day,  
I'm most enjoyed while others sleep.  
What few would wish to give away,  
And fewer still would wish to keep.—Bed.

A word that's composed of three letters alone,  
'Tis backwards and forwards the same;  
Though it speaks not a word, makes its sentiments known,  
And to beauty lays principal claim.—Eye.

There is a well known word in the English language, the first two letters of which signify a male, the first three a female, the first four a great man, and the whole a great woman.—*Heroine.*

What word is that in the English language, of one syllable, which, by taking away the first two letters, becomes a word of two syllables?

Answer—Plague—ague.

A word of three syllables—My first addresses another, my second is myself, and my third speaks of my company. My whole is the harbinger of hot weather.—*Sir-i-us.*

Why is the letter T like an island? Because it is in the middle of water.  
Why is a dream like childhood? Because it is in-fancy.

### COMMENCING WITH No. 35

The price of THE OPEN COURT will be:

For one year.....	\$2.00
For six months.....	1.00
For three months.....	.50
Single Copies.....	.10

Subscriptions already paid will be credited at this rate.

Parents who wish to send their children abroad and persons visiting Germany may find a home at the residence of Professor L. Buchner, Darmstadt, Germany, 24 Holzes street. See note on page 506 of THE OPEN COURT.

Rev. Henry Truro Bray's pamphlet, "Theism, or the Knowability of God," is published and sold by the author for 60 cents.

Mr. W. M. Salter will make lecture engagements for the month of June. Address, 516 North avenue, Chicago.

# The Open Court.

A WEEKLY JOURNAL

Devoted to the Work of Conciliating Religion with Science.

No. 36. (VOL. II.—10.)

CHICAGO, MAY 3, 1888.

Two Dollars per Year.  
Single Copies, 10 cts.

## THE ETHICAL BASIS OF CHARITY.

BY W. ALEXANDER JOHNSON.

There are few terms in the English language having wider and more varying uses than the word CHARITY. Its meanings include the highest human sympathy and the weakest and most puerile sentimentality; self-sacrifice prompted by pure love, and money bestowed on the promptings of the assessor and tax-collector. State Charity, Municipal Charity, are common terms. Alms given heedlessly to beggars, and the saving grace by which we regard opponents without hating or thinking evil of them are called by the same wide name. Recent attempts have been made, and the present writer pleads guilty to some of them, to restore to charity its ancient and true meaning, namely, that fervent love of humanity which is the best motive of acts of helpfulness, and without which they are of little avail. But the tendency of the popular use of language is too strong for any such restoration of meaning. The word is permanently fixed in its present and common use. So understood it is a useful generic term to include all that is done for man by man, with the intent to alleviate suffering, and in this sense it is used in this essay.

That much popular charity is misleading and hurtful will be readily admitted. That the whole tendency of charity, even that of the most ideal type, is in direct and perpetual conflict with the largest law of biology is perhaps not quite so clear.

The law of "The Survival of the Fittest" is without doubt the law of progress in animal life. If this law had unhindered operation in its application to humanity, pauperism would speedily come to an end. Every pauper would have choice of three resources: he could work, steal or starve; he could no longer live by beggary. Those with force enough for either of the former methods of life would survive as workmen or robbers; the remainder would die, and pauperism would be extinct within the present generation.

Now whether or no it would be possible to dry up the stream of charity which has flowed in varying depth, breadth and intensity for so many thousand years; if such a consummation would be desirable, if it would be right, the ethical man would be bound to accept it and set his face against alms-giving as he now does against gambling, falsehood or irregular sexual relations, not because of this or the other individual instance

of their evil results, but because of their general injurious effects on the race.

We propose in this essay to endeavor to trace the ethical line in charity, and to ask those whose conduct is founded on abstract right, so far as is consistent with life among so much concrete wrong, to choose the better way in benevolence.

It is easy to frame a grave indictment against what is called charity as it is usually administered. All the qualities which go to make up a brave, robust manhood, such a manhood as we hope for in the perfect race that is to be, are discouraged and obstructed by alms-giving. Dependence follows hard on charity; where that goes labor's muscles relax, prudence forgets her forethought; thrift, that honest old Saxon virtue, retires in dismay before the extravagance and recklessness fostered by free soup, free lodgings, free coals, free bread.

Pauperism is one of the great social evils of our time. Without charity we might have other things much worse, but we should not have pauperism. The pauper, the social parasite, is the product of poverty, plus laziness, plus charity.

Every time a want is supplied by a man's own efforts, the faculty which is called into play becomes stronger, and the recurring want is smaller proportionately to the power of meeting it. Every time a want is met by the exertions of some one else, the power of meeting it by one's own effort is weakened, and the want becomes greater proportionately to the faculties it should call out. By repetition of the former course the man becomes stronger, more independent, a more perfect being; by constant repetition of the latter he becomes a pauper, a parasite, as incapable of providing for himself as the insect parasite which has established itself in the body of its victim and has become a mere sac, its sole powers being those of absorbing nutriment prepared by the digestive functions of another creature, and propagating its species.

It is needless to dilate on the habit of dependence; we at once recognize that it is the destruction of all who acquire it. We know that it is contagious and hereditary, so that if we would eradicate its taint from the children of the pauper, we must early remove them into better conditions.

With dependence comes improvidence. Forethought and thrift are, of all the virtues, two that most need

cultivation in our land to-day. But poverty that should incite to thrift, as soon as it sinks into pauperism produces extravagance and recklessness.

Dependence and unthrift are contagious. The industrious, prudent man who with hard work and close economy has saved a little hoard against a rainy day, sees trouble come to him and his reckless, improvident neighbor, and sees charity make his neighbor's path even smoother and easier than forethought and self-denial have made his own. How likely he will be to question the wisdom of his own course and what a temptation it will be when the troubled time is over to practice the recklessness he has seen so well rewarded!

The ill effects of charity do not cease with the recipients nor with those who are tempted by their example to become such, but extend to the general condition of the laboring classes. One of these ill effects is the tendency to the lowering of wages. This has not become marked as yet in this country as far as the wages of laboring men are concerned. To see how charity can affect the price of such labor we must look at England, where at one time, and even yet to some extent, the wages of farm laborers were paid partly in cash and produce from the farmer, and partly in poor-relief from the parish overseer; and where provision for old age was not dreamt of by the agricultural laboring class, since to end their days in the poorhouse was looked upon as the normal course of things.

But if our system of county aid, especially in the West, where the presence of an able-bodied man in the family is deemed sufficient reason for denying relief, has so far discouraged the tendency of charity to lower the wages of day laborers, that tendency is seen with startling clearness in the wages paid to women and girls.

The poor woman who asks charity, and gets it, to eke out her miserable pittance gained by the inferior kinds of sewing, is establishing ever more firmly that pittance as the normal price of woman's labor. Some of those who give charity in such cases know it is wrong, but think they are helpless to do otherwise in the presence of suffering which they feel they must relieve.

When the Chicago Home for Self-Supporting Women (which itself is not self-supporting) was organized a few months ago, a prominent employer of girl labor who was asked for a subscription said: "If you will board my girls for \$2 a week I will give you \$500," and he could well afford to do so, for he could at once have reduced the pay of some hundred girls by enough to make up the amount of his subscription in a few weeks.

So fatal and inexorable is the law of supply and demand. As soon as the supply equals or exceeds the demand, as it does now with almost every class of female labor, except skilled domestics, the price de-

creases to the cost of production, which in the case of labor is the bare cost of living. Reduce, by charity or otherwise, the cost of a decent living and you decrease the price at which it is possible for the too numerous applicants for situations to accept them.

Every institution for the aid of the poor which makes it possible to live at a cheaper rate or provides for them in old age or sickness, our hospitals, homes, asylums, etc., although immediately benefiting the few, are yet, to the extent to which they encourage dependence and discourage thrift and forethought, remotely hurtful to the many, and all of them do these to some extent.

These ulterior effects of charity are all the more appalling in that it is not alone nor chiefly the recipients who are the injured ones, but the class to which they belong and the race of which that class is a part.

There is another grave evil attending charity as commonly practiced, and that is its deteriorating, its demoralizing, effect on the giver of alms. Every rich man who does not succeed in closing his eyes and ears to the facts of misery and suffering around him, knows deep down in his conscience that he owes a debt of help to those who are suffering, that he is his brother's keeper in spite of himself. Those who reason know that this debt is a debt of justice, that with perfect equity in the concerns of mankind most suffering would be abated or abolished. The wealthy man, or still more the man possessed of a fair competence, too often stifles this thought by giving a modicum of charity to relieve the suffering that is forced upon his attention. Whereas he ought to give time, thought and money, even to the half of his income it may be, to the problem; he compromises on a few dollars or a few thousands bestowed with little care and doing usually little good and much harm. If he had not this ready resource of charity to avail himself of he would be driven to more thorough and more just action.

The need of the poor and the rich is not charity in the sense of alms, it is justice—justice carried to the utmost limit of our dealings and including in its scope our obligations not only to the individuals but to the race. This justice done there would still be room for a very noble kind of helpfulness, but it would hardly take the form of soup tickets or the pauper dole at the office of the county agent.

But admitting all these evils let us ask: "Does charity diminish the sum of human suffering?" It is questionable that it does. The amount of suffering directly caused by foolish and wicked alms-giving is enormous; still greater is that indirectly so caused. To the former belongs the suffering deliberately inflicted on little children that their misery may bring a plentiful harvest of alms, and the wretchedness endured by the common pauper in alternation with the seasons of

extravagance and luxury that result from a larger haul than usual from some soft-hearted, softer-headed *benevolent* but *maleficent* individual; to the latter belong the ulterior results of unthrift, the severance of family ties in the poorhouse, the lower standard of life, the squalor and misery of the poverty that comes of low wages and overwork.

But doubtful as the answer may be to the question as to whether the amount of pain is diminished, there is less doubt as to the answer to the further question: "Is the sum of human happiness increased or diminished by charity?"

Contrast the dreary, pleasureless existence, for example, of an old man in the poorhouse, with his life in a house of his own, surrounded by children and grandchildren, honored and respected by his neighbors. Contrast the self-respect, that most fruitful source of happiness, engendered by the possession of a little competence for old age, with the dull, hopeless discouragement of the pauper, even when he is not suffering from cold and hunger. The difference in the amount of happiness under these different conditions is so enormous that when we reflect that the condition of the dependent is largely the result of charity, we cannot hesitate as to the balance we should strike, notwithstanding the very real, although often selfish, pleasure to the giver which attends upon acts of charity.

The conclusion to which we are forced is, that while charity probably does on the whole diminish to some extent the amount of actual suffering, it also diminishes the sum of human happiness; that but for a consideration to which we must come later, a race without charity would be happier than our race with charity, as we practice it now.

This is a serious indictment, but it is as truthful and earnest as it is serious. It will be observed that we indict not the best charity, not charity as it might be, but charity as it is usually administered. And yet it is impossible to free the most ideal charity from some of the accusations here made against charity in general. With all the precautions possible against imposture and abuse, with the most earnest desire to aid only the most worthy, and them in the way that shall develop their powers of self-help, it is yet certain that charity interferes from sentimental consideration with the great law of progress in animal life and to such an extent is hindering the progress of the race.

The obvious reply is that progress in animal life is not the whole of progress; that the ability to work, to save and to crush down the weaker in stern competition is not the highest form of ability. That the humane and emotional side of our nature demands development as much as the physical and intellectual. The spectacle of women and children dying of starvation because their husband and father had been killed by accident, or

had drunk himself to death; of old men and women dying of hunger and cold by the roadside because they had spent all their earnings while able to work, and saved nothing for old age; of men and women dying of painful diseases, neglected and alone, because they had not saved during health enough to keep them and provide doctors and nurses during sickness, would be far more hurtful to the race in making us brutal and degraded, than any check to progress in the other direction that can be caused by the demoralization consequent on charity.

Sternness and repression of sentiment might be more beneficent and might soonest promote the ends of justice, were it not that the effects of the sight of unrelieved suffering would cause a deterioration of our higher qualities, more rapid and more hurtful than the deterioration of lower qualities caused by alms-giving.

That is to say that when we are doing our best in charity, our ethical justification is from the side of the consequences to the givers and to the race through them, and not from that of the recipients of their help.

Here then is the ethical basis we set out to find. Charity is justified by its emotional effects, and not by those which are physical and intellectual.

It is *not* justified by its immediate effects on its recipients, who are always endangered and frequently injured by it, nor by its secondary effects through the recipients on the race, which is injured to the extent to which charity creates pauperism and dependence, lowers wages, allows the substitution of alms for justice, favors the survival of the unfit, and so lowers the racial tone.

Charity *is* justified by its effects on the giver and thereby on the race, in that it helps to develop the emotional and humane side of our nature and saves us from the debasing and brutalizing effects of the sight and the knowledge of unrelieved suffering.

If this conclusion is accepted as true or as an approximation to the truth, there is a very obvious corollary to be drawn from it.

If we are charitable for our own benefit we have a heavy responsibility to so act in relieving suffering that we may reduce the evils caused by relief to their lowest possible degree, and increase the benefits in the same proportion. We must not use the suffering of our poorer brethren merely as the opportunity for the operation of a selfish virtue, whether we practice it as a means of gaining heaven or only of cultivating, refining and strengthening our emotional and moral nature for life on earth. We must never forget justice in charity, and our aim must be the permanent benefit of those we assist.

It is evident that relief given in reckless haste, is likely to be more hurtful than where care and caution are exercised. Alms given to compensate for the persistent injustice of some one else, will most likely be a

foolish and mischievous interference between cause and effect.

To give by proxy and through some impersonal society will hardly bring to the giver a due return of emotional culture for himself and the race. The more mechanical charity is made the less virtue there will be in it, and the more it will promote habitual dependence. Money given perfunctorily without personal sympathy, is more likely to be a mere sop to the Cerberus conscience than when it is given directly and under the impulse of actual knowledge of the sorrow it is alleviating. Surely what we do should be done in such a way as to develop and not dwarf the self-respect of the person assisted. Help to self-help must be of all kinds the truest and most just kind of charity.

It is not the intent of this paper to enter into details of charity work. It is enough if we have indicated the line where justice and charity may meet.

Anyone who has followed the argument thus far and accepts the conclusions as true or as near truth, will be likely to look for more light in reducing it to practice. He will find light in abundance, if he looks in the right direction. The science of charity, although far from perfect, has made great advances during the last decade. Thanks to the theory of the organization of charity, and the association of charities, we have in more than fifty cities in the land societies which are trying to practice charity upon scientific principles. There must be a best way for everything, and the societies referred to have as their aim to preach and practice the best way in charity. And some such considerations as those set forth in this essay are the cardinal principles upon which they are founded.

#### THE INTERNATIONAL COUNCIL OF WOMEN. \*

BY MONCURE D. CONWAY.

Although the press has fairly reported the proceedings of the eight days' Council of Women which has just closed its sessions at Washington, the significance of that congress, its picturesqueness, its impressiveness, have not been fully reported in any account I have seen. Although for more than a generation I have been an interested and tolerably close observer of what is called the Woman's Movement, I have for the first time become aware, while attending these sessions, of the immeasurable work for human benefit which women have achieved during that time. There are many besides myself who can recall the chorus of ridicule which greeted the earliest demand for political equality put forth by a few women forty years ago. It came from a little Methodist chapel at Seneca Falls, New York, where Lucretia Mott and Elizabeth Cady Stanton had summoned a "Woman's Rights Convention." It was early in July, and with the celebrations of Independence day ringing in their ears, these ladies adopted a new Declaration of

Independence. It was a clever travesty of the Jeffersonian document and began: "When in the course of human events it becomes necessary for one portion of the family of men to assume among the people of the earth a position different from that which they have hitherto occupied, but one to which the laws of nature and of nature's God entitle them, a decent respect for the opinions of mankind requires that they should declare the causes that impel them to such a course." Every accusation against George the Third was turned against the masculine absolutism. "He has compelled her to submit to laws in the formation of which she had no voice." "He has taken from her all right in property, even to the wages she earns." And so forth. Even in that little assembly of 1848 the claim to female suffrage was warmly opposed and carried by only a small majority. The burning question had been, for sixteen years, whether woman should be allowed to speak in public. The anti-slavery society had split on that issue. In 1840 the Garrisonian wing sent a delegation to a World's Anti-Slavery Convention in London, of whom eight were women—Lucretia Mott at their head. After a heated debate the female delegates were refused admission; whereupon the male delegates declined to act, and London lost its opportunity of listening to the eloquence of both Lucretia Mott and Wendell Phillips. Mrs. Stanton, then on her bridal tour, heard the debate. There her friendship with Lucretia Mott was formed, and on their return home they inaugurated a quiet propaganda, which resulted in the convention referred to and its "amusing" declaration. Nevertheless, their movement grew. It was for a time chiefly among Quakers, among whom it had always been the custom to recognize female equality in schools and religious meetings. Now, after two-score years, some of those "pioneers" live to see vast results from their Quaker meetings. Elizabeth Stanton, whose snowy hair surrounds her blonde face like a halo, has seen at the National Capital a vast harvest, sprung from the seed then sown. This Council was not, indeed, summoned in the immediate interest of female suffrage, but it is largely the result of the awakening of women to their public duties which then began. So much credit to that movement being awarded, it may be affirmed that the results attained are of far more importance than any that could have been anticipated from the particular aim of those peaceful revolutionists of 1848.

In the Grand Opera House, at Washington, gaily decorated in every part with flags of nations and banners of states, every seat occupied, a brilliant company gathered daily, morning and evening, to make and to hear reports of the work of women. There were delegates from other countries, France, Italy, Denmark, Finland, Canada; three accomplished ladies from England to report that there women have the municipal

franchise, and are included in the new local government bill of Lord Salisbury. But the main work reported was from America. More than thirty organizations were represented. The variety of these, their intricacy, extent, experiences, and diversified operations, are bewildering. Temperance and peace societies, missions—half religious, half charitable—training schools, clubs, suffrage societies, social purity society, hospitals, labor organizations, all had their impressive history and account of services to render. A small Baptist charitable mission in a remote part of New Hampshire sends a lady of eighty-two years, able to tell a thrilling story of helpful work. A lady from Boston tells of reading rooms for women, with a bureau of information which includes churches, theaters, offices, homes; with lawyers retained to render assistance gratis to any woman deprived of her wages or otherwise wronged. And here are accomplished ladies from New York to describe equally important services for well-to-do ladies rendered by "Sorosis," which discusses all questions except those bearing on religion, politics and woman's rights. Medical ladies related their struggles in trying to taste the still forbidden fruit of knowledge. A scientific lady, in collusion with a great authority on brains, of the "opposite" sex, refuted the prejudiced statements of Dr. Hammond concerning the inferiority of the female brain. Another, a law-partner with her husband in Iowa, spoke in a way which would have impressed the judicial committee before which some of the delegates have pleaded. Everywhere activity, competence, culture, earnestness. Emerson used to say that eloquence was cheap at anti-slavery meetings. The same is true of this woman's congress. I remember days passed in the Capitol listening to the eloquence of Webster, Clay, Corwin, Seward, Benjamin: since those times I have never heard speeches so impressive, eloquent, statesmanlike, as those in Albaugh's Opera House. They were free from rant, and, if sometimes touched with fanaticism, were always quiet and candid. One very handsome lady, in an effective address, said that if men should finally refuse to admit women to participation in their political work, nothing would be left women but to set up a government of their own. It struck me that this was what they are really doing. A hundred years ago the original thirteen states were in hot debate whether they would ratify the Constitution. Now here were delegates from states more important than geographical ones, moral and spiritual states organized for the varied service of humanity and to confront every form of evil. They have adopted a constitution, with Frances Willard for President and Susan Anthony for Secretary of State. A wealthy lady has donated to them a whole block in Washington to found here a great university of women, to train them for all kinds of service to their country. It was the dream of Washington, Jefferson, Madison

and other forefathers, that a great American university should be founded in the federal city. It looks as if the women were destined to fulfill it. If these earnest and eloquent women, who have hitherto had to beg men for permission to help them, to heal where men must wound, should in this friendlier era form their ideal state, send their weaponless soldiers to conquer wrongs, establish their merciful police to aid the progress of civilization, might they not elevate the national government even more than by votes? Might not their ideal moral government hover, dove-like, over the chaos of parties, over the "bosses" and caucuses, until these should be raised and refined into something more worthy to be called a Republic? That such might be the result is suggested by the fact that since women have been awakened to the condition of their country, legal and political, momentous changes have taken place. One after another barbarous "survival" has been shamed out of the masculine code. Women now have rights to property, to professional work, to colleges and degrees, secured by their appeals to reason and justice. Some wrongs remain; even great New York preserves the unjust law which deprives women of any control over the children they bear. But few of the Northern States preserve that relic of ancient wrong. It is certain that such influences as these must continue, and it becomes wise men to consider whether they shall not share in this new order and co-operate with it, until the time shall be ripe to end the long divorce between the higher energies of man and woman.

Pathos and humor have been quaintly mingled in the proceedings. Ramabai Pundita, who speaks English, told the sorrows of the zenana; and when she gave the Hindu doctrine of woman, and how she brought all evil into the world, it was only her simple face which repressed suspicion of a covert attack on doctrines nearer home. The little Pundita must have been puzzled by the presentation of an American Indian, a large much-beaded princess, whose jolly looks did not quite confirm Alice Fletcher's report, that Indian women had declared to her they were better off as Indians than under white law. President Willard, as we may now call her, began her speech on organization by holding up her hand and saying "Look at that!" We were thinking it was a neat hand when she said "There's not much in it. But look at that!" With this she held out the same hand doubled into a little fist, symbolizing the potency of organization. The fist was not formidable. Were it only large enough to grasp a sword perhaps there would now be no suffrage question. The little symbolical fist so held out raised a smile at first, but it may have reminded others besides myself that the demand of woman on man is the only one that does not threaten, which appeals to the sentiment of justice. Helen Gardiner, who has long been an invalid confined to her room in New York,

suddenly appeared here and made the vigorous speech, full of wit as well as science, vivisectioning Hammond's statement on the female brain. To a startled friend, who supposed her ill at home, she answered, "I've been resurrected for this occasion." This brilliant lady, by the way, made some allusion to "the fable of the Garden of Eden," from which a sensation might have been anticipated. But the remarkable discourses from members of the Council to which Washington listened on Easter Sunday, proved that independence of thought has extended to religion. Many of these ladies are called orthodox, but I am told it is rare to find one who believes in eternal punishment, and that many reject the narrative of the Fall. As authority loves authority, so does one kind of freedom love another. Easter Sunday afternoon was given up to a succession of religious utterances: one speaker was a Congregationalist, another a Methodist, another (Mrs. Hooker, Mrs. Stowe's sister) described herself as a Christian Spiritualist. Boston spoke through Ednah Cheney, a "Parkerite," and from the same region came an able lady named Elizabeth Stuart, who presides over a "Society of Humanity." I have rarely heard so much unconscious heresy uttered by persons supposed to be orthodox. There was a learned and ingenious address by Mrs. Gage, explaining that in the word "Jehovah" are combined the male and female principles of deity; also, that the Dove, the Holy Spirit, originally represented the divine feminine principle. For this she referred to the Aramaic Gospel, in which Jesus says "My Mother, the Holy Spirit." Thus there were many varieties and shades of theological opinion, but also a prevailing religious spirit. It may also be doubted if so many different, even antagonistic, views were ever before uttered so freely on the same platform without eliciting an inharmonious note, or even a word of reply from one to another. It would appear that in the presence of a great and absorbing practical cause and concern abstract opinion is relegated to a subordinate position. Are we to gain liberation from dogmatism through the reconciling and charitable influence of women—who are sometimes said to keep the churches going? Are they to remind a dogmatizing world of the old saying, "I desire not sacrifice, but charity"? Some traces of asceticism may be discoverable in this Council, lingering, perhaps, from its Quaker sponsors; some of the leaders insist on a world without wine or the Havana solace, and frown on fashionable costumes and dances; but the puritanical phase is already passing, and it will probably be found in the end here, as in England, that the movement towards larger female freedom and culture will include the evolution of a mode more beautiful and healthful.

Robert Browning once remarked to his preacher, after a sermon on nature, "You ought not to try and

describe nature, but the impression nature has made on you." I have remembered his advice in speaking of this great Council of Women. It were idle to attempt to describe it. I have but briefly and lamely spoken of the impression it made on me.

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M. D.

Part VI.

DIET—CONTINUED.

Every disorder of the human organism has its characteristic moral symptoms. There are diseases which an experienced physician can recognize by the restlessness, the despondency, the apathy or the excitement of the patient, as readily as by any physical indications, and a text-book on the principles of moral diagnosis would have to include an important chapter on the moral changes effected by the use of unnatural food. Abnormal appetites can assume the phases of true chronic diseases, and the study of their concomitant moral and mental phenomena opens out a most interesting field of inquiry.

The doctrine of evolution readily accounts for the fact that under normal conditions of the animal organism nutritious and wholesome substances are attractive, injurious ones repulsive. In the course of ages the continued operation of natural selection can be easily conceived to have favored the survival of individuals distinguished by a predilection for the most appropriate food of their species and to have eliminated those afflicted with a morbid hankering after poisons. To the palate of a normal human child, apples, honey and nuts—the natural food of our next animal relatives—are naturally attractive; opium, strychnine and alcohol naturally repulsive. But, by a less explicable by-law of our physical constitution, the persistent disregard of such warning instincts can turn that aversion into a passionate craving, and substances which at first seemed almost intolerably repulsive may become the objects of a morbid appetite, rising from a furtive hankering to a violent and progressive passion, which at last will overpower the resistance of every nobler instinct and completely pervert the moral principles of its victim. "No denial," says a British prelate, "will shake my experience-proved conviction that the power of prayer may transform the vilest propensities of the human heart." But is it a less significant, or less indisputable fact that the effect of a mere chemical change in the harmless beverage known as must, or sweet grape-juice, will turn an upright man into a dastard and a genius into an imbecile?

The incipient stage of alcoholism is characterized by an irritable impatience of restraint, making discipline irksome, and occasionally manifesting itself in a cynical

\*Copyrighted.

disregard of politeness and decorum. Heavy drinkers are apt to delight in the wanton violation of formalities, and a certain aggressive coarseness of speech and manners is carried to as reckless extremes in the wine-drinking universities of the Rhenish border as in the beer-drinking villages of eastern Bavaria, and often neutralizes the high breeding of the most fastidious aristocrats.

"How do you account for the custom of ladies retiring before the end of a banquet?" Pückler Muscau asked his British host. "That's a pretty open secret; so we can make bawdry," was the blunt reply.

Under the direct influence of alcoholic stimulants the efficiency of the perceptive faculties is impaired, while the activity of the lower propensities is correspondingly increased. "Brain-workers," says Dr. Bouchardat, "should confine themselves to metaphysical tonics. Alcoholic drinks, at any rate, are unavailable for that purpose. Even after a single glass of champagne I have found that the slight mental exaltation is accompanied by a slight obfuscation. The mind soars, but it soars into clouds."

"*In vino veritas*," is a Latin proverb which would be considerably mistranslated by the assertion that alcoholic stimulants enhance the acumen of the mental faculties and thus facilitate the investigation of truth. Its real meaning is rather that wine loosens the tongue and thus leads to the revelation of private secrets. A realization of that risk probably suggested the adoption of the Macedonian table-rule which left a guest the alternative of a timely exit or complete intoxication.

Alcohol seems also to stimulate the amatory propensities, which, in their turn, react on the instinct of combativeness, the latter fact being curiously illustrated in the aggressive disposition of camels, stags, cats, and even quails and woodcocks, during the period of the pairing season. Hence those fits of pugnacity, following abruptly upon the maudlin endearments of an emotional toper. The traveler Kohl describes a scene in a Russian tavern, where all non-combatants sought safety in instant flight whenever a certain guest offered to kiss the bystanders, because they knew that a minute after he would try to brain them with a poker.

Long continued, the immoderate use of alcoholic beverages rarely fails to result in the loss of self-reliance and self-respect. Under the influence of alcoholism even men formerly distinguished by high-minded principles will become capable of gross iniquities, and often try to gratify their morbid passion by systematic deceit. Men who in their better years would have scorned to injure even an enemy by an intentional misrepresentation, have been known to resort to perjury and fraud, to appropriate a pittance needed for the support of their starving children or the hard-earned savings of a trusting friend. In the paroxysm of their alcohol-thirst baffled toppers have carried their point by stratagems beyond the

conception of any other passion, that of frenzied jealousy hardly excepted. Dr. Mussey, in an address before a medical society, mentioned the case of a tippler who, after squandering every cent he owned or could borrow, was at last consigned to an almshouse in a populous town of southern New England. "Within a few days he had devised various expedients to procure rum but failed. At length he hit upon one that proved successful. He went into the wood-shed of the establishment, placed one hand upon a block, and with an axe in the other, struck it off at a single blow. With the stump raised and streaming, he ran into the house, crying: 'Get some rum—get some rum! my hand is off!' In the confusion and bustle of the occasion somebody did bring a bowl of rum, into which he plunged his bleeding stump, then raising the bowl to his mouth, drank freely, and exultingly exclaimed: 'Now I am satisfied.'"

Opium induces a physical indolence strangely contrasted by a morbid activity of certain semi-intellectual faculties. "Wealthy mandarins," says the *North China Herald*, "arrange their funeral rites for years in advance, and meet death complacently, in the hope of having their virtues extolled by an orator under the influence of the choicest poppy-juice." De Quincey and Coleridge owed their weirdest conceits to the stimulus of the dreamy drug, and the "Arabian Nights" are said to record the visions of an opium trance. In the course of time, though, the enervation of the narcotized organism becomes more comprehensive, and the worn-out opium-eaters of eastern China are described as the most complete mental and physical wrecks seen outside of an idiot asylum. Opium and Buddhism co-operate in producing that absolute indifference to the approach of death which often amazes Caucasian visitors to the vice-centers of the far East. A batch of Chinese criminals will discuss commonplace topics with languid equanimity, while the court prepares to announce their doom; and during the recent Burmese campaign a British officer witnessed the execution of three native murderers who seemed to enjoy a pleasant siesta when they squatted down in the trenches to face the firing detachment. While the Provost Marshal examined the loaded muskets, one of the doomed men picked up a straw to clean out the tube of his pipe, and when two minutes after an ill-aimed ball of the first volley dashed out his teeth, his fellow-culprits were seized with a fit of uncontrollable laughter.

The rulers of the Bagdad caliphate used to stimulate the courage of their household troops with *hasheesh*, a narcotic still extensively used in western Asia and the Malay archipelago, where the votaries of the direful drug are apt to "run amuck"—rushing about with brandished daggers, till they are treated to an anodyne in the form of a knock-down blow. An extract of the same drug, is, however, used as a "love-philter," an additional

proof that pugnacity is a concomitant of the exotic passion. A moderate dose of hasheesh, like alcohol, promotes a convivial disposition, while opium-smokers love solitude and silence.

Tobacco is a moral sedative. The maxims of stoicism, or rather quietism, harmonize with the lethargic influence of the popular weed as naturally as the passionate temper of the South-Latin races harmonizes with the effect of their hot spices; and the equanimity of the tobacco-smoking Mussulman proceeds from a chemical, rather than philosophical, source of causation. Our carnivorous redskins seem to use tobacco as an antidote of their ferine instincts, and its lenitive influence may have promoted its adoption among the care-worn toilers of our feverish traffic-civilization. But those advantages are indisputably offset by the enervating effects of the nicotine habit. Inveterate smokers endure the vexations of daily life with a quietude which gradually passes into apathy and indolence; and though the moderate use of the seductive narcotic seems rather to promote a certain dreamy enjoyment of metaphysical studies, that predilection soon becomes a penchant for mystic reveries, and at last degenerates into a chronic aversion to mental efforts. The precocious use of tobacco is very apt to stunt the development of the more practical mental faculties. Boy-smokers are given to day-dreams and procrastination. In Spanish America the sight of a languid, cigarette-lethargized youngster is a very familiar phenomenon; and in a college-town of northern Belgium my tobacco-smoking schoolmates were characterized by a certain good-natured phlegm, coupled, however, with slowness of comprehension and often with latent selfishness.

The milder narcotics, tea and coffee, betray their influence only after years of habitual use, but the eventual symptoms of nervous disorder have their mental concomitants in a characteristic sensitiveness of temper, frequently degenerating into petulance, querulous aggressiveness, or its female modification, a certain lachrymose penchant for "playing the persecuted saint."

"Poison" and "stimulant" would seem to be interchangeable terms, for the drug-market hardly knows any virulent product of the mineral or vegetable creation which not somewhere has become the object of an unnatural appetite. The Ashantees fuddle with sorghum beer; the Mexicans with fermented aloe sap ("pulque"); the pastoral Tartars with fermented mare's milk; the aborigines of Honduras with hemlock sap; the natives of Kamtschatka with an infusion of the common fly-toadstool; the Druses with fox-glove tea. Arsenic, cinabar, and even acetate of copper, have their votaries; and the civilization of the western Caucasians has added absinthe, ergot and chloral.

All stimulant habits, however, are *progressive*, i. e. the besetting passion involves a hankering for a gradual

increase of the poison-dose, and all poison-slaves are liable to the temptation of making their tippie a Lethe of refuge from any unusual affliction. In China every public calamity is aggravated by an increased demand for opiates. The defeated Turks seek solace in overdoses of nicotine that have completed their national degeneration, and in western Europe famine and war have more than once been followed by veritable alcohol epidemics.

#### KARL THEODOR BAYRHOFER AND HIS SYSTEM OF "NATURALISTIC MONISM."

BY EDMUND MONTGOMERY.

Part IV.

Bayrhoffer seriously strives to gain a firm foundation for his naturalistic Monism. But, here, the notion that a unit of Being must necessarily consist of a "simple" essence—the same notion which for many centuries has played so confusing and ominous a part in our conception of soul or mind—leads our monistic philosopher to declare, that all monads must be in every respect equally constituted existents. Now, we can quite well understand why the mechanical world-conception is logically compelled to assume as original building-material equal units of mass; for its endeavor is to derive diversity in nature as brought about solely by difference of arrangement through difference of motion. But why should monads, which are conceived as irradiating centers of all manner of efficiency, be of necessity equally constituted, and this simply because they are assumed to be indiscernible and elemental?

The necessary consequence of such a conception of equal and indiscernible units of absolute Being is, that all difference in nature would have to be derived from nothing but the spatial grouping of the units, and the mere co-existence of their equal modes of elementary interaction. It is, however, incomprehensible how a number of equal and self-identical units should through intrinsic necessity ever enter into *different* modes of relation, and how they should come to form more and more heterogeneously synthesized compounds, that display most complex and unitary modes of interaction with one another.

This impossibility of conceiving, how simple, indiscernible and equal elementary units can ever form higher compounds, is an inherent weakness of Bayrhoffer's Monadology, as well as of the atomic world-conception. The atomistic notion amounts to the assumption, not that two and two equally conceived units constitute the higher compound "four," through mental or cerebral synthesis; but that two and two equal and real existents can constitute through mere spatial grouping a compound and yet unitary existent, essentially differing in nature from themselves; that for instance a certain number of atoms of hydrogen are through mere peculiar spatial grouping capable of forming oxygen,

and other numbers of the same atoms by the same means other material substances.\*

Bayrholder recognizes at least, that in order to derive heterogeneity in nature, there must already exist some specific difference in the factors of combination, and that such combination can be realized only in a synthetical medium of some sort. He says: "The heterogeneity of the materials, forces, motions and laws of the perceptible world, can find its explanation only in the fact that the identical monads are capable of entering into manifold *specific relations*; that consequently there exist divers systems of synthesis, and then again divers systems of such systems." As synthetical medium, in which complex effects are realized, he assumes a dynamical atmosphere or ether, constituted through the universal blending of all the interacting forces that emanate from the individual monads or dynamical centers.

But when urged positively to explain how differences really arise in his system of equal monads, Bayrholder is forced to base his qualitative or "specific relations" on a purely quantitative device. For monads being indiscernible, they can never lose their individuality or elemental identity in any kind of combination. Consequently, it can be only in the region of mutual contact, that, through the conception of a more or less profound interpenetration, any kind of heterogeneity can be made to arise. It is, however, as already stated, incomprehensible, how monads of an absolutely equal nature should ever, from intrinsic necessity, come to enter into unequal relations; to interpenetrate one another to an unequal extent, or to form in any way heterogeneous compounds.

Criticism, however, is not our present task. We wish only to point out how obscure the conception of absolute Being still remains, even to the most penetrating gaze. We are well aware that the problems here under consideration will be deemed abstruse and tedious by most readers; but whoever aspires to be a naturalistic Monist ought not to recoil from the trouble of learning on what philosophical and scientific basis his creed is actually resting.

Allowing Bayrholder to start with richly endowed real-ideal units, or psycho-physical elements of absolute Being, let us see how he proceeds:

Elemental being, though itself not perceivable by the senses, nor really figurable in imagination, carries, nevertheless, within it the ground of visibility. The universe, with all its material-spiritual phenomena, forms, laws, forces, can be understood and explained as the outcome of the interaction of those simple, indivisible, imperishable elements of Being, which have to be

conceived as centers of activity. They are as such the invisible foundation of the material universe. Being connected together in everlasting unity through ceaseless interaction, they compose the perceptible world. They are centralized spheres of life and motion, and by entering into interactive enchainment with one another they *create extension*, through their power of indiscernible self-preservation. Only as the product of such interacting living elements or monads can space-occupying matter be conceived to be the monistic reality, in which all natural phenomena rise and set. Take away the self-subsistent monadic substance, and the universe dwindles away into a system of mere relations without related subjects; becomes, in fact, a geometrical dream figured in empty space.

Real or objective space cannot be separated from real Being; for it is a form constituted by such Being. The separateness of its parts or its so-called extension, can be only the result of the resistance and repulsion of the elements of Being. And, that which unifies real space, making it one continuous expanse, is the result of the connection and attraction of these same monads or dynamic elements. Distance-producing self-preservation on the part of the interacting elements cannot be conceived without motion; for real space exists only as the product of the repulsive-attractive oscillation of monads and their compounds, and therefore with motion and time. Motion and time are consequently likewise products of the interaction of the elementary units of Being. Abstract empty space exists only in the imagination of thinking beings. Objective space is in all its parts an efficient reality, possessing definite limitations, and forcing these limitations on our individual space-perceptions. The entire sweep of our actual space-perception is certainly determined in every point by some real efficiency affecting our sensibility. There can be no empty places in any part of its extension, otherwise our perception would have no object and therefore be nothing.

The totality of monads constitutes the universe and is all in all. There exists nothing beyond; no absolute idea; no Deity; no immortal human soul. Only a totality of simple elements, subsisting together and keeping apart from one another by their own activity. No space, no time, no motion, are presupposed; absolutely nothing but the monads. These form through eternal and incessant interaction a definite whole. And the absolute ground or essence of the universe is, therefore, not the single monad, but the unity of monads. If this were not so, if the monad were a self-occluded existent, it would be devoid of quality, quantity and power of manifestation. It would be, in fact, the incognizable "real" of Herbart. The simple and ever-identical monad receives all its real attributes only in combination and relation. But relation without persistent entities between which it is to take place, would be a mere

\*It is the tendency of recent chemistry to conceive all material substances as multiple compounds of identical units. But the law of Avogadro, on which recent chemical theory is chiefly founded, presupposes, on the contrary, unequal specific weights of constituent atoms, which means that there are different kinds of atoms. And spectrum analysis demonstrates that even hydrogen must be a compound of at least four totally heterogeneous constituents.

form without essence. A world consisting of nothing but relations would be a phenomenon of nothing.

The universe is the absolute multiplicity of elemental individuals within the absolute self-conditioned unity of form. Perceptible matter, with all its mutable forms and forces, is the product of the ever-changing interaction of the monads. Following the tendency toward universal, but never-attainable equilibration, one state of existence issues from another ad infinitum, and the world can never come to a standstill, as predicted at present by scientists.

Now, it is inconceivable that an existent, while in contact with other existents, and during its affection through them, should not at the same time maintain its own identity. And this means that it must be a life, a force, something dynamical, exhibiting reactive efficiencies and differentiated self-identity. The monads standing thus in immediate relations to one another are suspended, as it were, in a connecting immaterial ether, through which they represent, stimulate, attract and repel one another. All perceptible matter is the consciously represented relative equilibrium of monads. All force, physical and mental, is the tension within monadic combinations. All motion the product of such tension when monads are striving from their present position to reach a new state of equilibrium.

Mental states, such as we are conscious of, are appearances, only within the highest forms of material beings. But since they inhere in the same matter, which in different combination is forming crystals and plants, the potentiality of spirit must be dwelling in all forms of nature, and consequently in the monad itself. Mind is the internal phenomenology of matter. Monads are reflecting units. They internally represent the activity exerted upon them by other monads. Such inner perception or illumination has always its origin in an affection of the monad from without by other monads. And this reciprocal perception among monads is the groundwork of all nature. It is the primitive power of unification or synthesis, and therewith primordial intelligence, and the germ of all the manifold forces of matter. For there is no force in nature that has not originated from the self-assertion of existents called forth from without. And matter, as the system of interacting monads, cannot be conceived as existing without reciprocal reaction or perception within its component units.

The monads are necessarily living beings, inasmuch as they are constituting a system of interdependent entelechies moving to and fro by impulsions given through sensibility. And this involves the internal representation of an external influence. Of course, this primordial intelligence of the elements of Being is not comparable to the consciousness of animals or men. Yet the mind or intelligence of the latter is only the highest form of such internal reflection.

The intrinsic vital and sensitive forces of the monads, causing the self-movement of alternate repulsion and attraction, are the fundamental energy of every natural phenomenon. In the progressive periods and regions of material evolution, the universe is passing from the external phenomenism of sensitive impulsions—which appear in our consciousness as the motion of unconscious nature—into an internal phenomenism of the same, by means of the building up of feeling and conscious systems of monads. In unconscious nature the primordial forces of the monads, which are perception and impulsion, continually and instantly dissolve into movements and constructions of perceptibly extended forms. In order that the consciousness of higher organisms may arise, there must take place a persistent reflection of the moving and constructing energy out of movement back into itself. The act of intelligence has to gain duration. And this occurs by part of the movement being steadily transformed into feeling. Just as the elements of matter through immediate and mediate penetration create from within an external center of gravitating equilibrium, so do the sensations and the impulsions become combined and centralized in the organism. Mediated through the coherent and materially perceptible system of the monads in which they inhere, they manifest themselves as concentrated feeling and volition in a concrete central part of the organic system. Consciousness is perception. It is an inner illumination of the stimulated center, caused by inhibition of reactive movement. Mind abstracted from nature is nothing but a chimera. The *ego* of an animal or man is a phenomenon of the united forces of a definite system of monads. Hence it is mortal, becoming annihilated through separation into elemental individuals.

In human beings there occurs a gradual transformation of natural necessity into purpose or idea. Purpose involves the representation of natural necessity in free consciousness. This allows the manifold forms of such natural necessity to appear in free consciousness as so many possible data of choice, enabling the subject to realize by force of his natural organism rather one form of reality than another. Hence purpose is a specific form of possible reality posited in human consciousness. And the subject of this consciousness seizes then upon the given data of the objective world, as means to realize his purposive idea. Necessity assumes thus the form of liberty.

Human beings, the further they advance in humanitarian progress, the more consistently do they feel urged to posit their entire life as an ideal, for the sake of whose realization they seek correspondingly to determine the objective world in all feasible directions. Man has no purpose outside himself. His whole being is rooted in the soil of natural necessity; and his purpose is simply the self-assertion of his human nature through

his own consciousness. Work, knowledge, morality, art, enjoyment, are all expressions of the self-assertion of the conscious subject. And the aim of humanitarian religion can be no other than to free the life of the human individual of all its inconsistencies, by means of the cumulative gain of work, knowledge, morality and art, attained by human society at large.

Bayrholder's ideal of human society is a social democracy established through the willing co-operation of all. He firmly believed in the future realization of the communistic ideal. Enthusiastically he exclaims: "Such an ideal is no chimera. It is a chimera only as man is a chimera to the animal, and Newton and Leibnitz chimeras to the savage. The time will surely come when humanity will look upon our present stage of civilization as only semi-animal."

We have now to take leave of our Wisconsin sage. We are conscious that it is but a faint and very imperfect idea we have been able here to convey of a life devoted to exalted meditation and to dutiful compliance with philosophical persuasions. With Bayrholder rational thinking had gained full mastery over the instinctive cravings of animal man. During his ardent search for true Reality, individual self-concern had well nigh lost itself in the contemplation of the great progressive upheaval of universal Being. World-wide philosophical conviction had become the living source of his hopes and fears. He felt, not as a self-occluded personal soul on a strange mission here below, but as a full-freighted and yet transitory impersonation of supreme natural achievement. And as he lived, so he died; in present joy and perfect confidence of the coming brotherhood of man, and the final triumph of the religion of humanity.

## NOTES.

### ECONOMIC CONFERENCES BETWEEN BUSINESS MEN AND WORKING MEN.

E. E. M. writes to *The Christian Register*: "The 'burning question' of to-day is undoubtedly the labor question; and it seems now as if almost every conversation, almost every meeting of thoughtful men and women for whatever purpose, brought out sooner or later various aspects of these problems for discussion.

"A good move toward their right solution has been made recently by Mr. Salter. He believes that the basis of all settlement of these questions must be the clear understanding by one party of just what the other wants and is trying to secure, and to this end he has planned and inaugurated a series of meetings which he calls 'Economic Conferences between Working Men and Business Men.'

"In these meetings the speakers are men representing the business interests of the city on the one hand, and the different phases of thought and organization among working men on the other. They afford to the latter the chance to hear employers and capitalists explain their own position and difficulties—subjects discussed usually at clubs and associations, where the listeners are comparatively of one opinion with the speaker. Here, equally, may the socialist, the trades-unionist, or the communist

expound his own views and plans, without fear of interruption, to the very men he wishes to meet. Miscellaneous discussion is excluded for obvious reasons; but, at the close of the evening's address, questions may be put freely, provided it is done in a proper manner.

"The first speaker of the course, George A. Schilling, represented one extreme of the Knights of Labor, which range, as he said, from the absolute individualist to the State socialist, and from the State socialist to the men and women who believe simply that in union there is strength. He is himself the extreme individualist; that is, he believes that no external authority should interfere with the doings of private individuals. He rejected the idea of the Knights of Labor that government should control railroads and other enterprises, but he thought that mutual consent and free competition would remove incentives to crime and other difficulties in the way of true progress. Individualist seems to be the new word for anarchist.

"The second lecture of the course was given by Lyman J. Gage, Vice-President of the First National Bank, on 'Banking and the Social System.' Premising that he stood there as a believer in self-government and in the largest practical liberty, he considered the law necessary to guard and protect that liberty. He thought the laws of supply and demand would eventually work out the problems, and that strikes would be settled by arbitration. He gave a history of national banking, presenting its advantages, after which questions were asked persistently."

In the third meeting Thomas J. Morgan spoke on "The Labor Question from the Standpoint of the Socialist." Most of the hearers must have been impressed that the socialistic ideal, if realized, would wipe out all individuality of man. Mr. Morgan described very vividly the evils of the present society, but the remedy offered by him would be worse than all these evils, for the socialistic society would be like a penitentiary in a grand style.

In the next number of *THE OPEN COURT* Wheelbarrow will have some remarks on the first conference.

### "RULES AND SUGGESTIONS FOR THE ORGANIZED CHARITIES OF LYNN, MASS.

*The Reporter*, an organ of Organized Charity, recommends the Rules and Suggestions adopted by the Associated Charities of Lynn, Mass., as the very best compend of its kind.

#### RULES.

1. As a visitor of this society you will not give money or its equivalent, except in case of absolute distress.
2. Approach a family with tact, delicacy and sympathy.
3. Study their condition, its cause, and by what means they can be raised to independence.
4. Never state the object of a visit as being to see if relief is wanted.
5. Do not disclose the information you gain to any person except the proper officers of the Conference.
6. Do not use your position for any purpose of proselytism.
7. You will not announce yourself as a visitor of any society, but as a friend or neighbor, hoping to aid them in productive work.
8. Do not take notes in the house you visit.
9. Be wise and cautious, but do not show suspicion.
10. Bring or send a report of your case to the Conference at least once a month. Attend the meetings of the Conference as often as possible, as you will find them helpful.

#### SUGGESTIONS.

As our object is the permanent improvement of the character and condition of the poor, we must strive to promote habits of thrift and industry. Insist on temperance.

The first aim of the visitor should be to establish friendly relations; this requires time and patience; we cannot expect to

win their confidence simply because we visit them, but must show an unselfish interest in them.

Encourage progress, however slow.

Be careful to avoid inquisitiveness.

Do not dictate, but suggest changes and improvements.

Be careful not to make the poor discontented; incite their ambition for what they may obtain, but do not make them strive for what they cannot hope to accomplish. Their lot is hard enough, and your aim is to cheer and strengthen.

Foster the pride of home and family; help to make the home cheerful by gifts that cannot pauperize, but rather tend to refine and elevate their tastes. If rooms are dark and unhealthy, help them to find better ones. If there are serious sanitary defects, report to the Board of Health.

Do not allow children to beg; it is demoralizing and tends to pauperism. See that young children attend school regularly and that older ones are employed.

Do not recommend aid in the case of vice or laziness. The relief of such, except in extreme need, is an injury to the family and a discouragement to their industrious and thrifty neighbors.

One great lack in the lives of the poor is bright, healthful entertainment. The crowded rooms and general discomfort of their surroundings often drives men to the saloon and young girls to unhealthy amusements. Visitors might arrange entertainments and talks, which would give a little brightness and cheer to the lives of the poor.

## OBITUARY.

Prof. William D. Gunning, lecturer and writer on scientific subjects, died at Greeley, Colorado, March 8th. He was born in Bloomington, Ohio, in 1830; graduated at Oberlin College, studied in New York City, and also with Prof. Agassiz; he held lectureships at Hillsdale College, Michigan, and in Pittsburgh, and was the author of a "Life History of Our Planet." He contributed to THE OPEN COURT the articles "Katzenjammer," in No. 1, p. 4; "Putting Off the Old Man, Adam," No. 3, p. 67; "Memory," No. 13, p. 361; "Tolstoi and Primitive Christianity," No. 15, p. 398; "The Old Man of the Sea," No. 19, p. 507, and at the time of his death had been engaged as the pastor of the Unitarian Society in Greeley.

Edward Schröter, a sturdy champion of free-thought, and one of the foremost promoters of liberal ideas among our German compatriots, died at his home in Sauk City, Wis., April 22d. He had almost attained the age of four-score. At the moment of death even his mind was engaged with the subject of his long life's labor, the establishment of free-religious congregations, and while the angel of death hovered over him he spoke of the constitution of the organization he had founded, and in which he had expressed his views.

George Ludwig Edward Schröter was born June 4th, 1811, at Lengede in Hildesheim. He visited the gymnasium of the latter place, and afterward the universities of Jena and Göttingen. In 1841 he had passed the necessary examinations in the department of theology. In 1845 he became associated with the German-Catholic movement, and his name was accordingly stricken from the list of eligible candidates to ecclesiastical preferment. He devoted his sole attention then to the establishment of the German-Catholic Congregation of Worms, but was deprived of the privilege of residence by a governmental decree. He emigrated to America in 1850. He immediately established a "Free Congregation" in the city of New York—a project which he was soon obliged to abandon by reason of his wife's illness. Schröter was called in 1853 to Sauk City. He was here obliged to pursue the calling of a husbandman as well as that of

a free-thought preacher, for the remuneration offered by his congregation was small indeed. The task was difficult, and only possible to a man of extraordinary vitality and strength of purpose. His success in this position has been confirmed by the independence he achieved and the universal recognition of those with whom he has been associated for nearly half a century. He acted as speaker in the Sauk City Congregation almost to the close of his life, while his later contributions and the support tendered to the "Freidenker" and the "Amerikanische Turnerzeitung" show that his interest in the liberal movement had not even then abated. He was one of the directors of the Radical Union, and represented his congregation as well as other German free-thought associations of this country as a delegate to the free-thought congress assembled at Brussels in 1880.

We give a translation of the main articles in the constitution of the Free Congregation (*Freie Gemeinde*) of Sauk county, in which are incorporated the views of his life's work:

(A.) This organization shall be styled the "Free Congregation" (*Freie Gemeinde*) of Sauk county, and the incorporation of the same shall be effected under this name.

(B.) This organization adopts the following leading principles as its fundamental rules of action; but it must affirm in advance that these leading principles are also supposed to be susceptible of continued development.

### GENERAL PRINCIPLES AND DEFINITIONS.

§3. The object of this organization is not the subjection of self to an external power, or to the authority of a person or book, which will, by such unconditional obedience, insure man happiness. It is the very opposite of that: it is the intellectual and moral freedom of man, his independence and self-dependence in thought, judgment, volition, resolve and action.

§4. The means to this end are consequently no supernatural and incomprehensible artifices (the sole traffic of a church), but the natural and comprehensible means whereby man is wont to influence the mind and character of his fellow-men, stimulating and ennobling them: discourse, song and interchange of opinion.

Nor do we preclude ritual forms so long as they remain unforced, reasonable and true to our sense of propriety.

For there are periods in the life of families, of nations and of mankind significant and serious enough to merit commemoration and which deserve to be celebrated in a becoming and edifying manner by those whom interest or sentiment have joined together. We could mention here the festival of gladness, celebrated by a family when increased by the advent of a new member, and the rites solemnized when a member passes away; the introduction of children into the congregation, after they have been instructed in the principles of the same; the ceremony of marriage; the celebration of the day of the birth or the day of the death of great men; the anniversaries of great historical events.

§5. We have no dogmas or decrees of belief, established for all time; we have principles and views of life only, and they are susceptible of continued emendation.

We seek to establish an independent view of life in order to adapt our mode of life independently to it.

For us there are no godless people in point of doctrine (theoretical atheists); there are godless people only in deed (practical atheists), that is, those who act as though no highest universal cosmic law prevailed to which they were to submit, and as though no moral cosmic order existed to which they were to conform.

We no more demand (decree) belief in God and immortality than we do unbelief.

§6. We recognize no order of priesthood as the exclusive bearer of the spirit of truth standing opposed to the order of laymen as mere empty vessels; as is the case with the Catholic and, to a great extent, with the Protestant church.

But we recognize preachers or teachers, who are elected by

free choice and installed by the congregation after their calling, fitness and moral character have been tested.

The persons appointed are by way of preference empowered to deliver discourses to the assembled members upon history, philosophy and morals, and to instruct the youth in the same subjects, without the opportunity being denied a member of the congregation to take the place of a preacher or teacher.

We lay especial emphasis upon educating the youth to intellectual and moral freedom, upon moulding their pliant minds and upon confirming the first lasting impressions their tender natures have received.

One of the first duties of the teacher in our congregation, therefore, is: to instruct the youth in history and morals, conscientiously and untriflingly; to stimulate them in acquiring an independent view of life in the family, in society, in the state, and among nations; to strengthen their power of moral judgment and feeling; to arouse in them respect and benevolence toward man; to instill in them the hate of servitude and the love of freedom; to practice them in self-control; to acquaint them with the ways and by-ways, the expedients and errors of life, to the end that they may accord with the development of the human race; and ever to keep before them the ideals of the noble men and noble women of Heathen, Hebrew and Christian history.

We expressly mention this essential part of juvenile instruction, for the reason that the public as well as the private schools neglect it. In the youth rest our hopes, the excellence and the happiness of our people.

On the same day, April 22, died Fritz Schütz, another German champion of free-thought, the editor of *Die Rundschau*, New Ulm. Schütz was born in Hassla, in 1834. After having been for some time the speaker of a free congregation at Apolda, he emigrated to America, where he worked in the same capacity in Philadelphia and Milwaukee. He was an able lecturer and a ready debater.

We note with regret the recent death of Mrs. Henry Sayrs, of this city. Few ladies of Chicago have done more to further the interests of the poor and needy, and few have left behind them a nobler record of self-renouncing labor. She was always a pioneer in movements designed to uplift and bless humanity. Thousands of the sick and wounded soldiers of the war of the rebellion have cause to remember her with gratitude.

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

#### CHAPTER XIV.—Continued.

Ilse opened one work after another, and she found that she already knew the Latin titles of some of them by heart. The Professor became interested in this occupation, and was always finding more little treatises which he had forgotten. Ilse laid them all before her in a heap and began solemnly:

"Now, a great moment has come for me. I wish to learn from you the contents of each writing as far as you are able to explain it to your wife. When I was already secretly in love with you, the children found your name in the encyclopedia; we endeavored to read the strange titles of your books, and Frau Rollmaus made conjectures in her way as to the contents. Then I felt sorry that I could understand nothing of what you had done for mankind. Since that, I have always hoped the day would come when I could ask you what it was that you

knew better than others, and on account of which I should be proud of belonging to you. The hour is now come, for you have to-day introduced me to your friends as your wife, and I will be your wife also there where your treasure and your heart are, as far as I can."

"Dear Ilse," exclaimed the Professor, carried away by her frank dignity.

"But do not forget," continued Ilse, with emphasis, "that I understand very little, and pray have patience with me. I have arranged how I will have it done. Write down for me the titles as they are in the foreign language, and also in German, in a note-book that I have bought for the purpose, first of your earliest works, and then the last. Together with this, note down whether you value the work more or less, and what is its importance for mankind. Underneath every work I will set down what I understand from your explanation, that I may remember them well."

She produced a note-book; the Professor searched again for some more treatises, arranged them according to date, and wrote each title on one page of the book. Then he gave his wife some explanation of the contents of each work, and helped her to write her remarks in the note-book.

"Those in German I will endeavor to read myself," said Ilse.

Thus they both sat bending eagerly over the books, and the Professor's heart beat with pleasure at the earnestness with which his wife endeavored to understand his occupations. For it is the lot of the learned man that few feel a hearty sympathy in the trouble, struggles and merit of his productions. What he builds up with enduring strength henceforth becomes a corner-stone in the immeasurable house of learning on which all the races of the earth have been laboring for thousands of years. Hundreds of others make a foundation of it to advance their own work; thousands of new blocks are piled upon it, and there are not many to inquire who has chiseled the separate columns, and still more seldom does a stranger grasp the hand of the workman. The light works of the poet are long greeted by those in whom he has raised a cheerful smile or an exalted feeling. But the learned man seldom makes a valuable confidant or friend of his reader by his individual works. He does not paint enchanting pictures for the imagination; he does not flatter the yearning soul; he demands the utmost seriousness and the closest attention from his readers, the benefit of which redounds to himself in every criticism that is made. Even where he inspires respect he remains a stranger.

And yet he is not a mere stonemason who cuts formless blocks according to prescribed measures; he also works independently and contributes his own life-blood, sometimes suffering great depression, sometimes full of joy and happiness. The fruits which he has grown for his times

\*Translation copyrighted.

have developed from the deepest roots of his life. Therefore the honest mind that enters heartily into the labor of the learned, and not only inquires for the ultimate result of learning, but takes an interest in the inward struggle of the workman, is to him a valuable treasure, a rare happiness.—Felix now looked with emotion at his wife, who was striving to occupy this position, and soft emotions pervaded the heart of the strong-minded man while he explained to her the subjects of his labors, —while he told her about the Roman *tribus* and the duties of the senate.

When all were noted down, Ilse laid her hands on the books and exclaimed:

"Here I have all. What a small space they occupy, yet they employed many laborious days and nights, and the best portion of your noble life. This has often given you flushed cheeks as you have to-day. For this you have studied till your poor brain has been on fire, and for this you have always sat in a confined room. I have hitherto looked upon the books with indifference, now for the first time I perceive what a book is, a quiet endless labor."

"That is not to be said of all," replied the Professor; "but the superior ones are more even than a labor."

He gazed lovingly on the walls along which the high book-shelves reached up to the very ceiling, so that the room looked as if papered with the backs of books.

"The great number of them quite frightens me," said Ilse, helping him to make room for his own books in a dark corner, which was now cleared for them as their resting place. "They look so calm and composed, and yet many of them may have been written with such impassioned feeling, and have excited their readers, too."

"Yes," said her husband, "they are the great treasure-wards of the human race. They preserve all that is most valuable of what has ever been thought or discovered from one century to another, and they proclaim what was once existing upon the earth. Here is what was produced full a thousand years before our era, and close beside them those that have come into the world only a few weeks ago."

"Yet, from the coats that they wear, one looks almost like the other," said Ilse. "I should have difficulty in distinguishing them."

The Professor explained their arrangement and led her from one book-shelf to another, pointing out those which were his special favorites.

"And you use them all?"

"Yes, and many more at times. These that you see here are only an infinitely small portion of the books that have been printed; for since the invention of books, almost all that we know and call learning is to be found in them. But that is not all," he continued; "few know that a book is something more than simply a product of the creative mind, which its author sends forth as

a cabinet-maker does a chair that has been ordered. There remains attached, undoubtedly, to every human work something of the soul of the man who has produced it. But a book truly contains under its cover the real soul of the man. The real value of a man to others—the best portion of his life—remains in this form for the next generation, perhaps to the most distant future. Moreover, not only those who write a good book, but those whose lives and actions are portrayed in it, continue in fact living among us. We converse with them as with friends and opponents; we admire and contend with, love or hate them not less than if they dwelt bodily among us. The human soul that is enclosed in such a cover becomes imperishable on earth, and, therefore, we may say that the soul-life of the individual becomes enduring in books, and only the soul which is encased in a book has certain duration on earth."

"But error persists also," said Ilse, "and so do liars and impure spirits when they are put in books."

"They undoubtedly do, but are refuted by better souls. Very different, certainly, is the value and import of these imperishable records. Few maintain their beauty and importance for all times; many are only valuable at a later period, because we ascertain from them the character and life of men in their days, while others are quite useless and ephemeral. But all books that have ever been written, from the earliest to the latest, have a mysterious connection. For, observe, no one who has written a book has of himself become what he is; every one stands on the shoulders of his predecessor; all that was produced before his time has helped to form his life and soul. Again, what he has produced has in some sort formed other men, and thus his soul has passed to later times. In this way the contents of all books form one great soul-empire on earth, and all who now write, live and nourish themselves on the souls of the past generations. From this point of view the soul of mankind is an immeasurable unity, which comprises every one who once lived and worked, as well as those who breathe and produce new works at present. The soul, which past generations felt as their own, has been and is daily transmigrating into others. What is written to-day may to-morrow become the possession of thousands of strangers. Those who have long ago ceased to exist in the body continue to live in new forms here on earth, and daily revive in thousands of others."

"Stop," cried Ilse, entreatingly, "I am bewildered."

"I tell you this now, because I too feel myself a modest worker in this earthly soul-empire. This feeling gives me a pleasure in life which is indestructible, and it also gives me both freedom and modesty. For whoever works with this feeling, whether his powers be great or small, does so not for his own honor, but for all. He does not live for himself but for all, as all who have existed continue to live for him."

He spoke earnestly, sitting surrounded by his books, with the setting sun casting its friendly rays on his head and on the home of his spirit—the book-shelves. And Ilse, leaning on his shoulder, said humbly: “I am yours. Teach me, form me, and make me understand what you understand.”

## CHAPTER XI.

## AMONG THE LEARNED.

Ilse popped her head into her husband's study: “May I interrupt you?”

“Come in.”

“Felix, what is the difference between Fauns and Satyrs? Here I read that Satyrs have goats' feet, but that Fauns have men's feet and a small tail.”

“Who says that?” asked Felix, indignantly.

“Why, here it is in print,” replied Ilse. As she spoke she showed an open book to her husband.

“But it is not true,” answered the Professor, as he explained the matter to her. “The Greeks had Satyrs, the Romans Fauns; but the gentleman with the ram's feet is called Pan. But how did this Bacchanalian train come into your household?”

“You said yesterday that the Councillor of the Consistory had a Faun's face. Then arose the question what is a Faun's face, and what is a Faun? Laura remembered perfectly that she had learnt at school that he was a fabulous creature of the Romans, and she brought the book in which these creatures are portrayed. What a wild set they are! Why have they pointed ears like the deer, and what have you to say, if even in such things one cannot rely on your books?”

“Come here,” said Felix, “and I will soon introduce you to the whole company.” He fetched a book of engravings and showed her the figures of the whole train of Bacchus. For a time the instruction went on well; but then Ilse objected: “They all have very few clothes on.”

“There is more room for art in the body than in the dress,” said her husband.

But Ilse became uneasy at last; she closed the book and exclaimed, coloring: “I must go; my help is needed in the kitchen to-day, as a new pudding has to be made. That is my high school, and the servant is still a novice.” She hastened out. “Tell your Satyrs and Fauns that I had a better opinion of them; they are very indecent,” she exclaimed, once more popping her head through the door.

“So they are,” exclaimed Felix, “and they do not wish to be otherwise.”

At dinner, when Felix had sufficiently admired the pudding, Ilse, laying down her spoon, said seriously: “Do not show me such pictures again. I would gladly like your heathens, but I cannot if they are like that.”

“They are not all so bad,” said her husband, con-

solingly; “if you like, we will this evening pay a visit to some of the notables of antiquity.”

With this day Ilse began a new period of learning. Soon a fixed hour was arranged for her husband's explanations—the most valuable part of the day to Ilse. First the Professor gave her a short description of the great civilized nations of antiquity and the middle ages, and wrote down a few names and dates for her that she learnt by heart. He pointed out to her that the whole life of man was, in fact, nothing but an unceasing receiving, producing and giving forth of the materials, pictures and impressions presented by the surrounding world,—and that the whole intellectual development of man is, in fact, nothing but an earnest and reverent search after truth;—and that the whole of political history is, in fact, nothing but the gradual subduing of egotism (which produces disunion between men and nations) by the creation of new wants, the increase of a feeling of duty and the growth of love and respect for all mankind.

After this preparation the Professor began to read the *Odyssey* aloud to her, adding short explanations. Never had poetry so grand and pure an influence upon her soul; the lively legendary style of the first part and the powerful development of the second quite captivated her heart. The characters became almost like living forms to her; she wandered, suffered and triumphed with them—raised into a new world of more beautiful images and higher feelings. Then when the conclusion came and the much-tried sufferer sat opposite to his wife, the scene of recognition made a deep impression on the heart of the young wife. She sat near her beloved husband, her cheeks suffused with blushes, her eyes moist with tears and modestly cast down; and when he ended she clasped her white arms round her beloved and sank on his breast, lost in transport and emotion. Her soul woke up, as it were, from long repose and glowed with deep feeling. The immortal beauties of this poem cast a radiance over every hour of the day, over her language, nay, over her bearing. She took pleasure in trying to read aloud herself, and the Professor listened with heartfelt pleasure as the majestic verses rolled melodiously from her lips, and as she unconsciously imitated his mode of speech and the modulations of his voice. When in the morning he went to his lecture and she helped him to put on his brown duffel overcoat he was greeted with the pleasant rhythm of this hexameter:

“Purple and rough was the coat of the cunning and noble Ulysses.”

And when she sat opposite to him during her hour of instruction and he came to a pause, these words of admiration broke from her lips:

“Thus thou cleverly thinkest, and wisely speakest thou always.”

And when she wished to praise herself, she murmured to the singing of the boiling kettle:

“Even in me lives wit, to discover the good from the evil,  
Formerly though I was but a child.”

Even the estate of her dear father now seemed to her illuminated with the golden splendor of the Hellenic sun.

"I do not understand," said her father one evening to Clara, "how it is possible that Ilse should so quickly have forgotten our farming customs. In her letters she speaks of the time when the cattle shall again wander in the wide plains; she means, I suppose, the fallow fields; but we feed our cattle in the stalls."

(To be continued.)

## Contents of Recent Numbers.

### THE SIMPLICITY OF LANGUAGE, THE IDENTITY OF LANGUAGE AND THOUGHT, PERSONA.

MAX MÜLLER.....In Nos. 9-11, 12-14 and 19-20.

Max Müller's essays must not only be read, they must be studied; and we should be very grateful that the eminent philologist uses so simple language. In spite of all the simplicity of Max Müller's style, it takes much careful study to fathom the depth of his thoughts.

### LANGUAGE.

E. P. POWELL.....In Nos. 24 and 26.

This essay of the American scholar should be compared with the essays by Max Müller. The study of language is of interest to the lawyer as well as the clergyman, the scientist as well as the teacher.

### DETERMINISM VERSUS INDETERMINISM.

PROF. GEORG VON GIZYCKI.....In Nos. 25 and 26.

Georg von Gizycki is Professor of Philosophy at the University of Berlin. His name is well known beyond the boundary of his country. The problem of the Freedom of the Will has perhaps never been treated in a clearer and more forcible manner. Prof. von Gizycki writes in answer to a book of Prof. James, of Harvard, wherein the latter defends indeterminism. Prof. James replied to these essays in a letter in No. 33. An editorial in this number discusses the same subject.

### BODY AND MIND, OR THE DATA OF MORAL PHYSIOLOGY.

FELIX L. OSWALD, M.D.....In Nos. 27, 29, 31, 33, 34.

Dr. Oswald treats this subject in the graphic manner so characteristic of him. He emphasizes the moral effects of physical causes, attaching to them an importance which by some is restricted solely to the physical effect of moral causes.

### GUSTAV ROBERT KIRCHHOFF.

ROBERT VON HELMHOLTZ.....In No. 27.

A very instructive essay on the famous discoverer of spectrum analysis. The same number contains an editorial upon the "Grammar of the Celestial Language."

### THE IMPORTANCE OF THE LOWER COURTS.

JOSEPH W. ERRANT.....In No. 27.

The able author, Mr. Joseph W. Errant, points out the shortcomings of our lower tribunals, and suggests the means of betterment and reform.

### D. THEOPHILUS.....In No. 30.

An able statement by D. Theophilus of that view which regards religion as a superstition, and objects to the use of the term in the sense employed by THE OPEN COURT. The criticism is editorially answered in the same number. A reply to Theophilus's criticism is also made by E. P. Powell in No. 35.

### GOETHE AND THE DEVELOPMENT.

PROF. CALVIN THOMAS.....In Nos. 29 and 31.

Prof. Calvin Thomas, one of the foremost Goethe scholars of our country, here presents the results of his research in this particular phase of Goethe's intellectual activity. He shows the wonderful universality of the great German poet, who anticipated ideas which have now become recognized axioms of scientific thought.

### KARL THEODOR BAYRHÖFFER AND HIS SYSTEM OF "NATURALISTIC MONISM."

EDMUND MONTGOMERY.....In Nos. 30, 32, 35 and 36.

An exposition of the philosophy of a German scholar and American citizen.

### APHORISMS.

HENRY BYRON.....In No. 28.

Gems of thought in terse and fitting language.

### CONDITIONS OF LIFE.

WM. PREYER.....In Nos. 32 and 35.

The subject is treated with great thoroughness and in a popular style.

### TO ARMS,

### THE POETS OF LIBERTY AND LABOR, AND MAKING SCARCITY.

WHEELBARROW.....In Nos. 22, 26 and 34.

Wheelbarrow has rapidly gained a well-deserved reputation as an author. He treats the social question from the standpoint of a laborer, and speaks from

his own experience. He unites in his writings Old Saxon simplicity, sincerity of heart, the truthfulness of honesty and warm sympathy for justice and right.

### ORIGIN OF REASON.

LUDWIG NOIRE.....In No. 33.

An essay of great importance; will greatly help to explain the views of Max Müller. The same number contains an editorial upon Monism and Philology, in which is discussed the identity of Language and Thought, the theories of Noire and Müller, and the proof with which modern philology has corroborated the monistic conception.

### UNDERSTANDING ONE'S NEIGHBOR, AN ENGLISH MONIST.

XENOS CLARK.....In Nos. 27, 34 and 37.

The author is well known as a writer for periodicals; his articles are full of zest and humor. In his contributions to THE OPEN COURT we become acquainted with Xenos Clark as a writer in the line of popular philosophy.

Parents who wish to send their children abroad and persons visiting Germany may find a home at the residence of Professor L. Buchner, Darmstadt, Germany, 24 Holzes street. See note on page 906 of THE OPEN COURT.

Rev. Henry Truro Bray's pamphlet, "Theism, or the Knowability of God," is published and sold by the author for 60 cents.

Mr. W. M. Salter will make lecture engagements for the month of June. Address, 516 North avenue, Chicago.

## THE OPEN COURT,

PUBLISHED EVERY THURSDAY BY

### THE OPEN COURT PUBLISHING CO.,

EDWARD C. HEGELER, PRESIDENT. DR. PAUL CARUS, EDITOR.

THE OPEN COURT is devoted to the work of reconciling Religion with Science. The founder and editor have found this conciliation in Monism—to present and defend which is the main object of THE OPEN COURT.

THE OPEN COURT has for contributors the leading thinkers of the old and new world.

Translations from the most prominent authors of Europe have been prepared, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social and economic questions.

For one year.....\$2.00 | For three months.....\$0.50  
For six months.....1.00 | Single copies......10

## PROFESSOR MAX MÜLLER AND THE SCIENCE OF THOUGHT.

BY JOHN CHAPPELLSMITH.

The great Thinker is the secretary of his age; if his mind glances beyond his contemporaries, he will not be listened to; if it outruns the majority, he will have little influence.

GEORGE H. LEWES.

It was greatly gratifying to see the doors of THE OPEN COURT thrown open and welcome given to three lectures on the crowning work of Max Müller's life, "The Science of Thought": viz., On the Identity of Thought and Language, and on the Simplicity of both. The province of *The Index*, I inferred, when established at Toledo, in 1869, was to discuss the problems of the nature of the World, of Life, and Mind, including the greater problem, the "Mystery of Existence." When *The Index* was removed to Boston and it became the special organ of "The Free-Religious Association," I felt assured that my inference was correct. But it is strange to say that I never saw the name of Max Müller even noticed in *The Index*, let alone his continued efforts to elucidate the great biological questions, as they are now carried on in England and America, from either a materialistic or an idealistic point of view.

Max Müller has been showing for more than twenty years that the same old problems disquieted not only all philosophers, but all to whom truth was a matter of real concern. The problems are still unsolved as to certainty in the evidences of the senses, of reason, or of faith, in regard to the beginning or the end of our existence; and as to whether the Infinite is a shadow of a dream, or the substance of all we know. The same old problems, he says, had exercised the sages of India, the thinkers of Greece, the students of Rome, the dreamers of Alexandria, the divines and scholars of the Middle Ages, the Realists and Nominalists, and again the followers of Locke and Hume in their conflict with the followers of Descartes and Leibnitz. Never, perhaps, did the pendulum of scientific thought swing so violently from pure spiritualism to pure materialism, as in the middle of the last century, and of this, in the struggle for primacy between mind and matter, when materialism seemed to have gained the upper hand over idealism (*Science of Thought*, p. 30).

These statements will be regarded as exhibiting a reactionary spirit; they do so, when considered as opposing the gospel of the day, that man is the offspring of a brute, and began as a savage. This consideration brings that gospel into direct conflict with the fact, that language is thought, and thought is language; and has led to the conclusion, that the real evolution of the human mind must be studied in the history of language. Some writers, Max Müller says, have drawn largely on their imagination in composing their picture of the human mind; on what it was in the beginning; and how it became what it is now. Others have looked among so-called modern savages for information on the primitive stage of human thought. Some light has been thrown on this difficult subject, but it amounts to only a few more or less plausible guesses, as to how man came to his senses, his reason, and language, in fact, to how man came to be man. The historical development of the human mind can be studied only in the archives of language; these reach in an uninterrupted line from the latest thought to the first word ever uttered by our ancestors; and it is in what the human mind has left, that Max Müller tries to decipher its true autobiography (p. 83). Besides the problem of the evolution of mind, there is that of the evolution of Nature. As the evolution of nature can only be studied in the products, which nature has left us, so the evolution of mind can only be studied in those products, which mind has left us. The earliest products of mind were embodied in language; therefore, in language the problem of the origin and growth of mind must be studied. The problem of the origin and growth of language and reason must be studied in the same spirit, that the evolutionists treat the origin of nature. Now, if language and reason are identical, if there is not a doubt, that language had an historical beginning and represents the work of man carried on through many thousands of years, we cannot, says Max Müller, avoid the conclusion that, before those thousands of years, there was a time when man was without language, and, therefore, without reason. There is no escape from it. Other philosophers, who reason fearlessly, have arrived at the same conclusion (p. 85).

Among these philosophers, Spencer, Huxley and Haeckel may be placed, but not Darwin. As regards

Darwin, Max Müller says he must explain why everything that he has written, has been to support the theory of evolution; he has had to protest against Darwin's interpretation of that theory. It is utterly unintelligible, how a student of the Science of Language can be other than an evolutionist; he has to deal with evolution from beginning to end (page 89). The theory of evolution which Max Müller holds, and seems more confirmed by every discovery made in the growth of nature, and in the growth of the human mind as represented in language, is this, that evolution in both starts from distinct beginnings, and leads to distinct ends. Therefore, in the growth of language he denies what Darwin denies in the growth of nature (differing thereby from most Darwinians), viz., in one uniform beginning of all organic beings from one primordial cell, and all words from one primordial root. This is not Darwin's doctrine, however of much importance in the present state of philosophic thought. But the first question must be, not of the possible transition from non-sentient to conscious and sentient matter, but with the development of a sentient into a rational being, or as others would say from an animal into a man. The whole theory of evolution ought to rest on the distinction between what is possible and what is not, or rather between what is not rational and never can be rational. Evolution means the turning of occult qualities into manifest ones, or possible qualities into real ones. Man may at one time have been a mute animal, but it does not follow, that every mute animal may in time become a man, nor that language, in which the evolution of mind is to be studied, presupposes no more than what exists at present in every ape (page 89). Max Müller says, he follows Darwin with all his heart in showing how many varieties, without necessity, have been raised to the rank of species or genera. He admires Darwin's great sagacity in observing the influence which artificial and natural selection have in producing variation and making it more or less permanent. Should he, or some of his followers, maintain that the actual genera which we see in nature, have, from the days before or immediately after the creation, proceeded from one primordial moner? Müller says he can conceive such a theory provided a power of differentiation is admitted in the germ itself. But what Max Müller most admires is what is called Darwin's inconsistency, but which proves his scientific consciousness, his admitting not one, but a number of progenitors for the great genera of nature. As he is no longer among us, it should be shown what he taught, and what is taught by his followers, who out-Darwin him. Darwin was opposed to monogeny; he held that there was not in the beginning one primeval cell, which in time developed into every living thing, "but four or five progeni-

tors for the animal, and an equal or lesser number for the vegetable kingdom." A celebrated divine told Darwin, that the conception of the Deity creating a few forms capable of self-development into other needful forms, was as noble a conception as that of creating fresh forms to fill the void caused by the action of His laws. Darwin says, he sees no "good reason why his views should shock the religious feelings of any one."

Max Müller, at page 105, is inclined to go much further than Darwin. The question is not, whether one conception of the Deity is more noble than another (how can even a celebrated divine decide that?) but simply, whether in our conception of creation or development any extra-natural influence must be admitted. He says if he interprets Darwin's words rightly, he seems to be one of those who admit, nay, postulate some extra-natural cause, however, he may shrink from asserting anything regarding the mode of operation. Darwin's books should be read carefully from edition to edition. Look at the last words in the "Origin of Species." "There is a grand era," he says, "in this view of life with its several powers, having been originally breathed by the Creator into a few forms or into one." The words "*by the Creator*" were absent in the first edition; why, says Max Müller, were they added in the later editions? Doubtless for a purpose. Why do those who express the highest admiration for Darwin, ignore this and similar passages. For instance, Haeckel, the most fiery apostle of Darwin in Germany, calls himself a Darwinian, and yet maintains that in the present state of physiological language, the idea of a Creator, a Master, a Life-giver, has become entirely unscientific; one primordial form is sufficient, a Moner produced by self-generation. Max Müller says, page 107, he is not frightened by Haeckel's views, he has seen such defended from the very first beginning of philosophic thought by arguments perhaps more powerful than any adduced by recent philosophers. He admits that the idea of a creator causes far more difficulties than it removes. But what he cares for, is historical accuracy. He cannot bear to see the misleading statements according to which two systems of thought, so diametrically opposed on the most momentous questions as Darwin's and Haeckel's, are allowed to pass under the name of Darwinism, as for instance in the Index of August 12, 1886 (Science of Thought, page 107).

The theory of the development of all living beings from inorganic matter is Darwinian rather than Darwin's. A discovery as to how inorganic matter could be changed into organic, would lead to an understanding of the origin of life; it would form the strongest foundation of the theory of development, and Darwin

would have readily welcomed it, could he have conceived it possible in the present state of knowledge. But he could not conceive such possibility. So, while Darwin abstained, those who out-Darwin Darwin (as Prof. Romanes says), showed far greater scientific courage. There is a break in the principle of continuity evidenced in the chasm between the living and not-living. Spencer remarks in relation to this difficulty, that scientific discovery is daily narrowing the chasm. A few years ago it was held that chemical compounds similar to organic could not be artificially formed. Chemists have discovered the art of raising up complex compounds from simpler, and believe that they will eventually produce more complex which will give a clue to the lowest forms of life. Huxley says the feat has not been accomplished, but Chemists will not cease trying. Max Müller says this is very able pleading, but it is detrimental to the discovery of truth. How can it be said that the chasm between inorganic and organic bodies is narrowed, because certain substances have lately been built up in the laboratory which are not organic substances themselves, but simply secretions of organic bodies? The question was not whether some of the products turned out of the laboratory of a living body can be imitated, but whether such a living organic body can be built up out of dead organic matter. Max Müller says he should be satisfied with much less. If he gives Spencer carbonic acid and water, will he make starch out of them? (p. 109.)

It is a violation of the fundamental laws of scientific reasoning to offer such an hypothesis as the real explanation of the problem of life. Darwin kept clear from such vain imaginings, from the primitive slime, from self-generation, from the one primordial cell and all the rest. At present, he said, we cannot bridge over certain chasms, which divide the inorganic from the organic world, and certain great divisions in the organic world from each other. Darwin admitted different beginnings of organic beings, and required the ancestors of the four great genera of organic beings. He did not attempt to explain the beginnings, but used language most widely intelligible, by saying that "life was breathed into these few forms by the Creator." The ancestors granted, all the rest becomes intelligible. Individuals to be individuals must vary, and that variation in time may lead to what are called varieties, what the ancients would have called, more correctly *εἶδη* or species. But whatever the bundles of what *is seen* are named, they are bundles of man's own making. The origin of species is in the mind of man. A few more words about species or what is seen. Max Müller says, genus and species are both of our own making, they are concepts. "If Darwin had studied the history of the word species \* \* \* \*

he would have called the book not the Origin, but the Abolition of Species," for to Max Müller's mind the results of all Darwin's observations and reasonings show "that the word species is dead." He says there are individuals, more or less permanent varieties, and there are genera; "but species in the old sense of the word, there are none." (Science of Thought, p. 375.) Max Müller says, Darwin has never told us what species means. Read the book from beginning to end; there is not a real definition of species in it.

Jesus, in the flesh, told his disciples that he "had more to tell them, but they could not bear it now." Max Müller has more to tell the readers, but I fear they cannot bear it now, perhaps will not. He says with all his gratitude to Darwin for putting an end to the terrorism of those physiologists who raised every variety into a species, and insisted on an independent origin for every variety of living beings, he thinks Darwin "allowed himself to be carried away, when he *denied an independent origin to man.*" Why Darwin, in addition to his four progenitors, imagined that there could not be a fifth for man, Max Müller cannot understand. If there is something in man, which has not been as fact shows, inherited from a monkey or any other animal, something of which even the most rudimentary germs are absent in the whole animal genus, and which has imparted to man a character entirely different from all living beings, namely, language, why represent him as the descendant of an unknown, but certainly speechless, ape (p. 158).

#### THE ANIMAL SOUL AND THE HUMAN SOUL.

BY CARUS STERNE.

Translated for THE OPEN COURT by V. G. J.

Ever since a philosophic view of nature has existed, there have been disputes regarding the relation of the animal intelligence to that of man. It was evidently in the interest of all those, who believed man to be of divine origin, who accorded him an unquestioned dominion over the brute with the right of immortality and—last, but not least—the prerogative of sinfulness—it was evidently in their interest to deny that the animal possessed either reason or soul. They declared both to be the exclusive right of man, and they thus erected an insurmountable barrier between man and brute. Aristotle, though believing animals to be possessed of sensation, memory and passion, nevertheless, denied them the faculty of reason, and it was this latter fact, which made it possible for Thomas Aquinas to incorporate Aristotle's philosophy into the systems of Orthodox Christianity. Orthodox Christianity, therefore, could concede the animal a material soul perishing with the body, while it reserved for man the imperishable, immortal soul.

The enthusiastic recognition which the philosoph-

ical system of Descartes met with among orthodox circles is explained in the same way; for Descartes first ventured to declare the animal a perfect machine. Descartes, also, was one of the first to assert positively that the brain is the organ of thought in man. He had devoted especial attention to the unconscious and involuntary movements which follow in the brute body in answer to some external irritation, and which he termed reflex motions; and he was convinced that everything in the animal body occurred according to mechanical laws. We can observe similar involuntary movements in ourselves. Nor need we resort to abnormal cases, in which illness or an operation, as in Goltz's frog-experiment, has severed the connexion between the brain and the spinal column,—when the creature under treatment, though completely bereft of sensation in the feet, nevertheless, when tickled under the soles, unconsciously moves them; for the human body in its normal state of health affords us innumerable examples.

"If our best friend," says Descartes, "who, we are quite certain, will never strike us in the eye with his fist, acts as if he meant to do so, we cannot, despite our greatest efforts, keep our eyes open at the moment of the blow; the mechanism of the body is thus even stronger than the will." We know that we are unable to suppress the desire to cough, sneeze, etc., caused by irritation of the mucous membranes; we can scarcely betimes resist the necessity, coming from within, to laugh or to scream.

Entirely beyond the control of our consciousness and will are the movements of the breath, the beating of the heart, the organs of digestion, etc., which act with mechanical regularity—systems, which appear to be mutually interdependent, but which are entirely independent of that which we call thought, consciousness, soul. The originator of the newer philosophy, with the logic peculiar to his system, then concludes: animals are nothing more than well-built machines.

The most orthodox people of the time accepted this assumption of the master, without considering the doubtful conclusions which must follow. The great Leibnitz was one of his most faithful and concurring supporters, and the more than orthodox Jesuit monk, Malebranche, was his enthusiastic disciple. It cannot be denied that in the animal body all the functions fit and co-operate with the precision of a machine, but they forgot that the same is the case in man, and if proper reasoning were employed, the same conclusion must be applied to him. To reach this conclusion, it was evidently necessary to possess a more perfect knowledge of the human body, in addition to a little boldness and freedom from prejudice.

The first who unhesitatingly did so, and publicly ex-

pressed his opinion upon the subject, was the French physician and philosopher La Mettrie, whom Frederic the Great invited to his court, and so greatly honored and respected, that, upon his early death, he dedicated to him an original oration in memoriam, which he delivered in the academy of which La Mettrie had been a member. This intellectual physician, from his observations in the sick-room, was firmly convinced, that Descartes's assertion also applied to man, and he published his view in a brightly written book entitled "*L'homme machine*" (*Man a machine*). He adopted the view of Descartes and Leibnitz, that the animal body could be compared to a clock with innumerable wheels and springs, which was wound up and kept going by the food it assimilated; and he believed that in this respect the relation of the human to the animal body is no different than, for instance, the relation of an astronomical chronometer to a Black Forest clock, or the relation of the automaton of Vaucanson to the movable figures on a hand-organ. Although, in doing so, he merely gave expression to the secret convictions of older philosophers, and anticipated those of a large majority of posterity, his contemporaries, partly, because they were angered by his derision, and, partly, because they were disturbed in their calm belief, hated him, and they spared no effort to calumniate the memory of this, the first prophet of the modern materialistic school. Even the French encyclopedists, who said essentially the same thing in other words, joined in the general condemnation. His death, which was caused by too liberal an indulgence in a probably underbaked truffle-pie, of which he partook at the board of the French ambassador in Berlin, furnished a most welcome excuse to declare the gay, but in his conduct ever irreproachable man, a *non plus ultra* of debauchery, immorality, impiety and wickedness. It is but recently that the character of La Mettrie, who did no more than draw the correct and inevitable inferences from the Descartes theory regarding animals, has been cleared from the marring blots which religious bigotry and philosophical fanaticism had cast upon it; and some years ago Dubois Reymond held an effective oration in the Berlin academy in defense of the much-condemned philosopher.

The calculation of the Cartesians, that they would protect man from similar comparisons by attributing to him a soul, which animals are without, was evidently an error. For upon close investigation we find this soul so closely and inseparably interwoven with the mechanism of the body, that it cannot be parted therefrom without being injured. There are innumerable actions, apparently regulated by the will, but in reality entirely independent of it. If, when falling, we carefully extend our hands to break the force of the fall,

this occurs quite involuntarily, and we scarcely know that we did so. But many of our intentional actions occur under a similar coercion, and finally it becomes extremely difficult to decide just where "free will" begins in man. The closest self-observation and all the conning of philosophically-inclined heads have not been able to determine whether man really possesses a free will; and very profound thinkers have emphatically denied it. Without doubt the physical actions are being constantly regulated by the central organs in which all external influences meet; but not less frequently it is evident that the body is commanding and the mind is obeying. This co-operation becomes most instructive when we observe how that which is mentally acquired, is finally absorbed into the automatic mechanism of the body. "Our animal," as the brilliant Xavier de Maistre termed the human body, cannot without due trouble learn to talk, write, work, play the piano, etc. But when the muscles are once accustomed to it, the mind, having done its duty, can be dispensed with, and "our animal" walks quite unconsciously, and dances and plays the piano entrancingly; yes, there are said to exist automata even so accomplished, that, like the machines of Kempele and Vaucanson, they can chatter a whole evening, and write thick volumes without any thought whatever. In all similar accomplishments, the mentally acquired has been absorbed into the physical automatism, and this transition is the great stumbling-block in the whole question.

Far be it from us to consider the comparison of a man with a machine a justifiable one, but we think we have shown how unjustifiable and even dangerous it is to attempt to apply this comparison to an animal.

In order to avoid such unsuitable and irrelevant comparisons, we can do nothing better than to accord to the brute a higher place and a small share of the mental capacity of which we are so proud; otherwise our undeniable relation to the brute would necessarily debase us to its own level. Among the ancients, already, those who denied that the animal possessed sense and reason, were opposed by a large number of philosophers and naturalists. Parmenides, Empedocles, Democritus, Anaxagoras, Strabo, Ænesidemus, Plutarch and many other philosophers taught that the animal draws conclusions and treasures experiences very similarly to man, and also some Christian ecclesiastic authors, such as Arnobius, Lactantius, and others agreed with this opinion.

Even in more modern times, there is perhaps no philosopher or naturalist who has been warmer in his defense of the animal against undervaluation and depreciation, and who has more strikingly brought out its similarity to man, than the Neo-platonic philosopher Porphyrius, in a very fine treatise, in which he

endeavors to convince his friends and disciples that, for moral reasons, they ought not to eat meat. He says that we regard all human beings as related to us, firstly, because they are all of similar descent, and then, because of the similarity in the build of the body, in food and in customs. But animals are of the same origin, possess a like physical constitution, like feelings, desires, passions, aye, even like sicknesses, as man. The souls of different animals vary just as do their bodies, but in principle they are alike. "Now," he continues, "if customs are the result of mental and physical constitutions, and if all animals think, and only differ in their descent and manner of bringing up, then all living creatures are related to us and of the same origin; they all possess the same system of nutrition; they all, as Euripedes says, have a mind and red blood, proving our mutual parentage of heaven and earth."

This emphatic declaration of the natural relationship of all living beings to each other, is almost without parallel in all ancient literature, and most excellently this enthusiastic defendant of oppressed animal-creation continues to prove that animals see, hear, smell and taste just as man does, and in many cases are endowed with senses far more acute than ours. "The differences of organism," he says, "may create differences of sensation and thought, but they cannot alter the *soul-life* any more than they can expunge or kill sensation. We may then accede to a *more or less*, but not to a positive *non est*, saying that we possess it, but they do not." With the same right with which we deny that animals possess reason, Porphyrius sarcastically adds, the Gods might deny that we possess it, because they are far more intelligent than we are.

Neither Giordano Bruno, who in his treatise on the "Cause, the Principle and the One," made similar observations regarding the relation of the animal to the human soul, nor Rorarius, who, although he was nuncio to Pope Clemens VII., wrote an excellent book in much the same spirit, gave better illustrations of the striking similarity between the animal and the human intelligence, than did Porphyrius almost a thousand years before. Yes, it almost seems as if he were addressing one of our worthy contemporaries, who disputes the similarity in the mental processes of man and brute,—when he says: "How absurd it is to say that animals do not experience joy, have no sentiment, know no fear, make no resolutions, are devoid of memory;—but that the bee only "apparently" remembers, the swallow "apparently" makes a resolution, the lion "apparently" possesses sentiment, the deer "apparently" is timid. I wonder what they would say if some one were to assert that animals do not really see or hear, that they only "apparently" hear and only "apparently" see, only "apparently" talk, in

fact, they do not really live at all, but only "apparently" live." There is a bitter but well-founded irony in these words, which, incredible though it may seem, are applicable to animal-psychologists of the present day.

(To be continued.)

#### AN ENGLISH MONIST: PROF. SEELEY OF OXFORD.

BY XENOS CLARK.

##### II. A NEW VIEW OF ATHEISM.

In a previous essay the views on theism which Prof. Seeley sets forth in his *Natural Religion*, were outlined; a word may now be said as to his treatment of atheism, a topic which he handles in a manner almost startling for its originality, and for the new outlook opened before the unsuspecting reader, who perhaps has begun the subject with gloomy anticipations of the old-fashioned, conventional invective against disbelief. Of invective there is enough, of a reasonable kind, but it is employed in a quite new manner. *The Abuse of the Word "Atheism"* is the title of the chapter, and it is the author's object to show that men apply the word in question wrongly, and that it is this mistaken use of the word which feeds the common belief that atheism is on the increase. Let us not be frightened, Prof. Seeley says at the beginning, by the terrific things said, and the terrific controversies waged on this dread subject. For it has often been remarked of theological controversies, that they are never conducted more bitterly than when the difference between the rival doctrines is small. This is nearly correct, but not quite; our author adds: "If you want to see the true white heat of controversial passion, if you want to see men fling away the very thought of reconciliation, and close in internecine conflict, you should look at controversialists who do not differ at all, but who have adopted different words to express the same opinion." This being so, it may be well before condemning atheism indiscriminately, to inquire carefully just what it is, and what it is not, and it possibly will turn out that some things commonly given this name are worthy things and undeserving of the appellation, while other things not given the name ought to be doubly marked with it.

For what is atheism? It is, says the author of *Natural Religion*, but another name for feebleness. It is not the name for a wrong belief, but for absence of belief—for that weakness of mind which cannot hold any positive view about the universe. Free-thinking, therefore, is not atheistic, because it has a positive belief, nor Science, for it has likewise. "An atheist, in the proper sense of the word, is not a man who disbelieves in the goodness of God, or in his distinctness from Nature, or in his personality. These disbeliefs may be as serious in their way as atheism,

but they are different. Atheism is a disbelief in the existence of God—that is, a disbelief in any regularity in the universe to which a man must conform himself under penalties." This is very clear. The scientific man then, the rationalist, the positivist, the pantheist—none of these can be atheists, for they believe in a "regularity in the Universe, to which a man must conform himself under penalties." We must notice that God, in Prof. Seeley's dialect, is not an exalted personage, surrounded by angels, who dwells somewhere in the empyrean; he is the great, and good and guiding influence in the Universe—is law, unity, human progress, "any regularity to which a man must conform himself under penalties." This is God; and a disbeliever in God is one who acknowledges no such influence.

We may pause here a moment to inquire what is Prof. Seeley's object in thus newly defining atheism, in a way which seems to withdraw much of the old terror from the word? Is it merely a cheap trick—a turning of the tables on the theologians—a scheme to soften the infidel's thorny seat? No one who has read the book will believe so. The author is too earnest, too devout, too tolerant a writer for such a device; he is a man with a far-reaching purpose—a purpose constructive, not destructive; and we see that he appeals to thoughtful men, not to the rabid mob, whose conception of intellectual progress is throwing mud and smashing windows, and whose estimate of a book's value rises with the number of cheap jibes it contains. Since, then, Prof. Seeley does not address radicals, but liberals, what is the animating purpose in his treatment of atheism? It is, I think, to clear away the burden of petty considerations which weigh down this subject. We all know great and good men with characters rich in every highest effort, who walk through life branded as atheists; we have known also puny, shrunken, conventional lives called theistic, and in our hearts, whatever the lips may say, we never doubt which of these two classes really lives nearest to God. The church declares the former lost, the latter saved; but we know what our hearts think; and now, Prof. Seeley seems to come and say, in his fine, strong way, let us say what our hearts think. But, he seems to say also, let us not repeat the mistake of the churches' and, simply reversing their method, call everything atheistic, excellent, and everything theistic, vile. Rather than that, we should inquire how it was the churches fell into so great an error, and then seek to avoid similar ones. Doubtless they fell into it through clinging to a conventional idea of God, adopted from the past, and therefore ill-suited to the present which they nevertheless insisted must suffice for the present. The great need, then, is to broaden the idea of God. Has nothing great or good come into

the world since the Bible was written? Let men seek, then, for what is Godlike in that, and name it such. The contrary course has too long prevailed. Scientific men, accepting the designation of atheists, given them by the church, have hardened themselves to life without a God—the greatest deprivation they could know, and one unnecessary in their case, as we have seen. To rectify this mistake of the churches, to show such men that they are not atheists, but still have a Deity, is Prof. Seeley's main purpose, I think, in the chapters of his inspiring book.

But if, then, in this new and broad and deeper sense, so many things which men have been accustomed to call atheistic, are not really such, is there, the reader may ask, anything whatever to which the name may be rightly applied? Yes; there are many such things. Returning to the definition of atheism as the failure to recognize any dominant order or power in the Universe, it is clear, in the first place, that the head-strong and self-willed person is an atheist. "Not to recognize anything but your own will; to fancy anything within your reach if you only will strongly enough, to acknowledge no superior power outside yourself, which must be considered, and in some way propitiated, if you would succeed in any undertaking; this is complete willfulness, or in other words, pure atheism." And Prof. Seeley gives for an instance of this the case of unhappy Poland, who "expiates the crime of atheistic willfulness—the fatal pleasure of unbounded individual liberty, which rose up against the very nature of things."

Then again the Philistine, the little-minded man, no matter what his creed, is an atheist. A wrong belief about God is not necessarily atheistic, but a puny any petty belief is, because it is really no belief at all. This class, the Philistines, constitute the large populations, the thriving communities of the world; they are the people who think of God only on Sunday, and then merely in a conventional way; their life consists of details, their thoughts never seem to respond to the ennobling influence of laws and principles, "their homely talk never willingly travels beyond what time the train starts, and whether it happened on Monday or Tuesday." All such are atheists.

When the French Revolution flamed through France, who were the true atheists? Not the Revolutionists, who had a strong and energetic belief, but the crowd of Voltairian Abbés-cynics, good-livers, priests, performing the services of a religion in which they had lost all genuine faith—with which their connection had become merely conventional. Such priestly forms of atheism are common in the present time, when so many ministers of the gospel find their faith undermined, and yet cling to the old forms. Trusting thus neither the old nor the new, their lives

are apt to become cynical and hollow. "In the ardor of conflict they have pushed into the foreground all the weakest parts of their creed, and have learnt the habit of asserting most vehemently, just what they doubt most, because it is what is most denied. As their own belief ebbs away from them, they are precluded from learning a new one, because they are too deeply pledged. As their advocacy grows first a little forced, they by degrees become consciously hypocritical, until in the end they secretly confess themselves to be on the wrong side; what a moral dissolution! Henceforth, they see in the universe nothing but a chaos. They are atheists, without a God, because without a law. Such men may often be noted among the most intelligent adherents of aspiring causes."

These—the self-willed man, the Philistine, the priestly sceptic—are some instances of true atheism, given by our author. And he does not pause with these. Every trite and shallow and useless existence he would call atheistic—the lounge, the cynic, the Utopian, the enragé—whoever sees no dominant power and order in the universe, and finds no serviceable work to do for its sake.

As Atheism is but another name for feebleness, so the universal characteristic of belief, Prof. Seeley says, is energy. He who has a faith is twice himself. Just as atheism does not consist in a wrong belief about the universe, but in the absence of any substantial belief whatever, so theism "consists not in possessing a true, or meritorious, or consoling theory, but simply in possessing a theory of the Universe. He who has such a theory acts with confidence and decision; he who has no such theory is paralyzed." So rude a theory of the universe as Mohammed's, restored a scattered nation to unity and power; so harsh and unconsoling a one as Calvin's has given vigor and heroism to thousands of its votaries. And here we turn to Science. Is Science atheistic? No, for it recognizes a dominant order or power in the Universe. Although Science does not find in Nature any special benevolence toward man—although it finds there little hope of a future life—still it does not follow that its votaries are not theologians, and it is quite clear that their theology gives them energy. Many other theologies, besides Science, have admitted no future life. And although Science does not believe that Nature is benevolent, "yet it has all the confidence of Mohammedans or Crusaders. This is because it believes that it understands the laws of Nature, and that it knows how to deal so that Nature shall favor its operations. Not by the Sibylline books, but by experiment; not by supplications, but by scientific precautions and operations, it discovers and propitiates the mind of its Deity.

The conclusion, then, is cheering. Science we

see, is not irreligion, but a different kind of religion; a kind not always inspiring perhaps, but still a religion. And as to "atheism, that demoralizing palsy of human nature, which consists in the inability to discern in the Universe any law by which human life may be guided, there is, in the present age, less danger than ever, and it is daily made more and more impossible by science itself."

I have intentionally quoted very freely from Prof. Seeley. No other manner of presentation could do justice to his notable book, in which the *manner* of writing is as significant as the matter. And, instead of attempting a summary of the whole volume, which, crowded as it is, with fresh and original thought, would have been impossible, I have taken the alternative course of presenting with some fullness, the author's views on two main points: on theism and on atheism, in their relation to Science. His position on these points, as will have been seen, is thoroughly monistic; *i. e.*, he finds in that order and oneness of the Universe, which science has made evident to man, the Deity and the religion of the future. This idea, and cognate ones, are developed through a series of pregnant chapters. They are entitled: God in Nature; The Abuse of the Word "Atheism"; The Words "Theology" and "Religion"; Three Kinds of Religion; Natural Religion in Practice; Religion and the World; Religion and Culture; Natural Christianity; Natural Religion and the State; Natural Religion and the Church.

But every reader should know the book at first hand. Written by one of the most eminent of English scholars, who had previously surprised and charmed his contemporaries with his "*Ecce Homo*," it is one of those works which really effect something. Every page gives evidence of the incisive thinker in touch with all the influences of modern thought; but also of the humane and cultivated scholar, gladly cognizant of what history has already done for the race. To those who feel that history has done nothing for the race—who would sweep the board clean and begin anew—Natural Religion indeed will have little meaning, and little to those whose lofty ideal of the intellectual life is to post themselves on the street-corners of literature, and pass their time tweaking off the hats of the clergy as they pass. Fortunately, these two classes, or this one, for they are identical, are on the wane; and there could be no better evidence of the fact, than the appearance in the field of liberal literature, of such solid and scholarly works as *Natural Religion*.

#### ECONOMIC CONFERENCES.

BY WHEELBARROW.

I hail it as a healthy sign that the political unrest created by the "Labor" agitation has weakened the division-wall between capital and labor in Chicago;

and let us hope that in due time the wall will be shaken down. At last some of the just and more enlightened men of the wealthy class hold out their hands to the laborers and say, "Come let us reason together." This invitation has been accepted, and the result is an interchange of opinions through the medium of "Economic Conferences," where all sides may be heard.

That we are in a state of social war is due largely to the ignorant rich. They have made themselves a caste having rights, to whom the poor are a caste owing duties. The rich who are not ignorant must also bear a part of the responsibility. They have wrapped themselves in pleasure, and have avoided the meetings and discussions of the working men. They have abandoned the laborer to his errors, and made an enemy of him who might have been a friend. They have shorn the locks, and put out the eyes of Samson, but his arms clasp the pillars of the temple. They have left the working man to his passions and allowed him to become the spoil of demagogues and blind leaders of the blind. They refuse to meet the laborer in debate, and then they reproach him for his fantastic visions of a new and impossible society. They decline to guide the people right and then complain because others guide them wrong.

When the wild and irrational tactics of the Trades Unions alarmed Great Britain fifty-five years ago, Macauley warned the ignorant rich, and the luxurious rich that because of their neglect the poor had fallen under evil guidance, and he adapted the parable of Gotham to the social condition of England. The trees having decided to elect a King, the vine would not accept the office because of its cheeriness, and the olive would not because of its fatness, and the fig-tree would not because of its sweetness; so the bramble was anointed King, and out of the bramble came the fire that devoured the Cedars of Lebanon.

I greet these conferences as a truce to barbarian methods on both sides, to the vengeance of the bomb, and the vengeance of the gallows. There are moral forces throbbing in the rich and poor alike, and out of these forces all measures of reform must come. Physical and intellectual powers make changes, but only moral forces make reforms. It is not true that in this land we have reached the alternative between anarchy in robes and anarchy in rags.

In the "Conference" course the opening was given to the working men, and the first lecture was by Mr. Geo. A. Schilling, an eloquent man and a leader in the "order." His theme was "The Objects of the Knights of Labor." The hall was crowded, and the audience was highly charged with mental and spiritual electricity. The positive and negative elements of opposing social forces were under very active excitement, while the banker and the blacksmith, the millionaire

and laborer jostled each other in their eagerness to hear a "Knight" of the latter day crusade which is to rescue the holy land from lords, rents, mortgages, and monopolies, a soldier in the chivalry of labor. It reminded me that when I was a youth in England, it suddenly became the fashion for earls and barons and bishops to come to the Mechanics Institutes and lecture to the working men. They spoke to us with a patronizing air, and we listened with humility as became our lower station. At Mr. Schilling's lecture I was glad to see that neither "order" was disposed to ask or offer patronage. The genius of the occasion was democratic and its influence was good.

Mr. Schilling spoke as an advocate, and yet he declared himself opposed to some of the especial objects of the order. He confessed that radical differences of opinion existed among the Knights themselves as to the wisdom of their own constitution in some of its essential claims. He was himself an extreme individualist, opposed to the theory and doctrine of state socialism on which the order itself was built. He would restrict, and not extend the powers of government. More dangerous to the order than the men within it of opposite opinions, are the thousands of its members who have no opinions at all. From all this it is easy to predict the early dissolution of the society. In the evolution of organized labor it must give way to more scientific agencies; to a higher order of Knighthood able to contend with the actualities of life, and to muster into service all the moral forces of the time.

Mr. Schilling is an enthusiast, and his argument had much of the strength and some of the weakness that belong to enthusiasm. Parts of it reminded me of the Wendell Philipps I heard long ago. He said, "The hanging of a few agitators will not abolish popular discontent." This is true, because the discontent will remain so long as the reason for it remains. John Ball organized the Knights of Labor in England five hundred years ago. The government hung John Ball, but the Knights had more necks than the government had ropes, and the order in some form or other has lived on to this day. The weakness of Mr. Schilling was his apology for the exclusive, aristocratic, monopolistic principle which actuates the Knights of Labor. It is no excuse that the working man, suffering under a sense of wrong, his home forever haunted by the ghost of hunger, has a right to clutch at the law of self preservation, and shut his fellow craftsmen out of that part of the labor market where his own muscle is offered for sale. He has no such right, and the assertion of it has ever been the weakness of the Trades Unions, and the Knights of Labor. The Exclusion principle is unjust, and like every other injustice it carries punishment and failure upon its wings. Labor statesmanship, like all other statesmanship must stand on a moral foundation,

or it will not permanently stand. The objects of the Knights of Labor cannot be separated from their methods, and they must all be criticised together.

Among the objects of the Knights of Labor was this: "The greatest good for the greatest number," and Mr. Schilling's own defense was evidence that in the mathematics of the Knights the greatest number is number one. It is a deceitful phrase always used to cloak the tyranny of those who claim to act for "the greatest number." In political morality there is no such principle, because it implies a smallest number outside the Common Weal; a smallest number entitled only to the smallest good. I never see this popular bit of sophistry without looking behind it for some injustice which it covers, and I generally find it. Slavery used to be justified for "the greatest good of the greatest number," and in the present case the sentiment is used to excuse practices which in themselves are indefensible, harsh regulations which arrest liberty, which make work for one man and idleness for another, which are supposed to make high wages for the "Knight," and low wages for the churl. I advise the Knights to erase that false motto from their coat of arms, and substitute for it "the greatest good for all."

Mr. Schilling claimed, and with success, that the use of machinery in the mechanic arts and the subdivision of hard hand and brain labor into easy elements had changed industrial conditions and had silently worked a social revolution in 50 years; a revolution in which the working men had altogether the worst of it, and whereby capital had multiplied its power; a revolution by which the master has become a more and more intelligent energy, and the workman a more and more unimportant and unintelligent hostler, harnessing and unharnessing, driving, and grooming the machine. Of the multiplied product the greater part had gone to the owner of the machine, and very little to the hostler. This was not the exact language of Mr. Schilling but it was the substance of his claim, and I think he was right. Ingenious machinery has broken up several of the mechanic trades into separate bits of work, each one of them requiring very little strength and very little skill. Where formerly twenty men made twenty watches, each man making one, twenty girls will now make two hundred watches in twenty separate parts. The girls simply tend the machines whose cunning fingers make the wheels, and springs, and all the inside works with a delicacy and precision that human fingers cannot imitate. The shoemaker is becoming extinct like the Indian. The shoes are made in parts by different machines. Furniture is made in the same way, and cabinet making will soon be among the forgotten arts. This evolution of industry is the puzzle of economics, the despair of politics. That this multiplied product is a blessing to mankind is true. It is immensely for the

greatest good of the greatest number, but there is a smallest number stunned and bewildered by the revolution claiming that society has abolished its means of existence, and giving back to it no compensation out of the increased abundance. That society will adapt itself in time to the changed conditions is true, but while society is doing it two million willing hands are reaching out for work and unable to obtain it.

I know the claim is made that the increased product is fairly divided, although not equally divided and that the working men are getting absolutely and relatively a greater share of it than capital receives. Mr. Edward Atkinson asserts that the rate of wages has been increasing absolutely in more money, and relatively in lower prices for what the workman has to buy. He proves it by the statistics of 60 years. His figures are fallacious, for the problem is not the rate of wages and the price of provisions to the man in work, but the puzzle is this, what is the rate of wages of the man who is earning nothing? And what is the cost of provisions to the man who is not getting any wages at all? The million or two of willing workers who are not able to obtain work is a factor in the problem that confuses the statistics, and gives a moral contradiction to the mathematical proof. Labor is not prosperous wherever there is an over-production of men.

While our moralists and statesmen stand baffled and dumb in the presence of this ugly fact, is it any wonder that untaught laborers blunder in their statesmanship too? Is it any wonder that like the fly in the spider's web they entangle themselves more and more in their efforts to be free? Must we expect more wisdom in them than in their masters? More virtues too? They will struggle for better things. They may not struggle wisely, but they will not lie down. If their plans are vicious help them to better plans. Society must learn that moral consequences are not to be evaded, and that justice must be done. Working men begin to see how precarious is their bread. They begin to see how easy it is to "lock them out" whenever the "trust" they are working for chooses to "shut down" in order to make scarcity and raise prices. In the midst of the ills they suffer, and the greater ills that threaten them it is folly to expect that working men will quietly lie down and patiently await their doom. "I shall be made into soup to-morrow," says the turtle in the restaurant window to the passers-by, but we must not expect such calm philosophy as that from the American working-man.

"The Earth is the Lords, and the fullness thereof;" and according to the Knights of Labor it belongs to all his creatures. Literally, they want the Earth, and this claim is endorsed by Mr. Schilling. He is opposed to the private ownership of land, or as he called it the monopoly of land. He contended that all the people

should have free access to the land, and that mines ought never to be private property. He said if the coal mines of Pennsylvania had not been owned by a few rich barons the strikes would not have occurred. Perhaps the strongest point in his lecture was this, and the strength of it was due not so much to its abstract merit as to the fact that the avaricious combinations of mine-owners increase the price of coal, while their absolute control of the markets enables them to "lock out" the miners at any time when they want to stiffen prices by making scarcity. Land ownership although its abuses may be modified can hardly be abolished. Give a man free access to the land and the very day he applies his labor to it, he becomes entitled to some security for its permanent possession, and ownership is nothing more than that. Ownership of land has always developed the free spirit of a people, and it may be doubted whether it is possible to abolish the freehold without abolishing freedom too.

Mr. Schilling was opposed to the demand of the Knights of Labor that the capricious power called "Government" should own and operate all the railroads, canals, telegraphs, banks, boats, bridges, gas works, water works, Express Companies, and other enterprises, on the principle that government becomes despotic in proportion to its power, and for the further reason that government is not able to work as efficiently and cheaply as private individuals can. The whole question is one of expediency rather than of principle and depends greatly on the conditions that surround the government, and on the elements that comprise it. In this country the scheme would be a good thing for "the party in power." It would make the tenure of office permanent, and settle the question of civil service reform. At the last presidential election all the mail carriers marched in the Blaine procession. Had all the railroad men and telegraph men and the rest of them joined in the line we should have seen at once how hopeless would be any attempt to "turn the rascals out." And it is a curious phenomenon in this country that the "ins" are always the rascals and the "outs" the honest men.

In some respects the Knights of Labor builded better than they knew, and better than they ever meant to build. For instance in the demand that women shall have equal rights with men for equal work. This has come to mean not only the right of women to equal wages, but the equal right of women to earn wages wherever they can, and this meaning is given to the claim by many of the Knights, perhaps by a majority of them now. It was not so intended at the beginning. Behind the fair face of it was concealed a sinister design. The intention of it was, though all the Knights may not have known it, to draw the line between men and women at the sewing machine, and to drive the

women back behind that line. It was thought that if this demand for equal wages could be enforced, employers would say, "well, if we must pay the same wages to women as to men, we may as well have men." Some of the Knights have a hope that such will be the effect of it yet, but most of them are now, as a few of them have always been, sincere in their claim of equality for women. Besides, the women are so strongly entrenched in the professions, the clerical employments, and the lighter mechanical trades that it would be impossible to turn them out. In this, as in some other things, the order has had an educational influence on its members. Its successor, for it will have a successor, will abandon many of its claims and dogmas as gladly as men discard old boots that never fitted them. The new order will be wiser and better than the old one.

The means by which the Objects of the Knights of Labor are to be achieved according to Mr. Schilling, are Agitation, Education, and Co-operation. I have only room for a remark on the Education plan. When Mr. Schilling was asked if the Knights included in their scheme of "education" the instruction of the hand, the right of a boy to be educated in a trade, he would only answer affirmatively for himself, and was not willing to do so for the Knights of Labor. It is well known that the Knights of Labor restrict the education of the hand, which they have no more right to do than they have to restrict the education of the mind. They have no more right to forbid a boy to learn a trade than they have to forbid him to learn reading, writing, and arithmetic, for by the aid of these he may some time or other compete with some Knight for a job. They have no more right to sentence a boy to hard labor for life with a shovel, a wheelbarrow, and a hod, than they have to sentence him to hard labor in the penitentiary. So long as they persist in doing it they will fail to get the sympathy of just and liberal men outside the order, and they will lose the sympathy of many just and liberal men inside of it. Their platform must come to the test of the spirit-level, and all its inequalities must be planed away. Otherwise the order will be an obstacle in the path to liberty, a hindrance to the elevation of labor.

#### THE BIBLE AND FREE THOUGHT.

At present there are two distinct views concerning the Bible, viz., that of the so-called orthodox, and that of the irreligious radical. Those advocating the former view believe that the Bible was revealed by divine inspiration and communicated word for word. They declare that it contains nothing but truth,—absolute truth. The advocates of the latter view consider it a book full of paradoxes and contradictions. They ridicule it as the *non plus ultra* of superstition and the very basis of bigotry.

Both parties are in error. The Bible although not dictated by the Holy Ghost *verbatim*, is from a human and secular standpoint the grandest and sublimest book we have. Compare it with the sacred books of other nations, with those books which are the old store-houses of ethical, religious and mythological ideas. Compare it with the *Koran*, with Hesiod's *Cosmogony*, or the *Völuspá* of the Northern Edda, or the *Zend-Avesta*, or even the *Vedas* and the *Buddha Gospels*. What impartial judge would not give preference to the Bible?

Goethe found in the Bible an invaluable store and an inexhaustible mine of poetry; he ranked it far above Homer. Read the passage in Humboldt's *Kosmos*, where he expresses his admiration for the Hebrew literature and more especially the poetry of the psalms!

The sacred books of all nations, and particularly the Bible form the basis of our modern ethics. That the Bible should bear traces of the times in which it was written, is quite natural. But it also points far beyond its time, in that it contains germs which have developed into a higher ethical culture. It is this that gives to the Bible its value.

The Bible, when regarded from the standpoint of narrow bigotry, becomes a tissue of almost unexplainable absurdities. How many things, which can be explained by the ideas and manners prevalent in those times, must now appear incongruous. No matter how much the irreligious and flippant scoffer may differ from the bigot in his ultimate opinion concerning the Bible, his view nevertheless coincides with the latter's in that they both gauge the Bible according to the same standard. Both demand proofs of absolute truth; and because the infidel does not find them he deprecates it and ridicules the pretensions of believers. Both the bigot and the scoffer lack scientific insight.

If we consider the Bible from the standpoint of the severest and most radical criticism, we shall only learn to prize it all the more, on account of its poetical treasures and on account of the valuable evidence it affords of the growth of religious, ethical and philosophical ideas.

From this standpoint of careful and earnest scientific investigation the Bible will be read with the greatest pleasure and edification.

We prize our old legends of fairies and witches, heroes and ogres, of the shepherd boy who slays the giant and becomes a king, but we are blind to the beauty of the story of David and Goliath. And why are we unable to appreciate its charm? Is it not because, when we first read it with our teacher, the human features of the story were ignored? They were purposely thrown aside and something superhuman, something awe-inspiring was wrongly substituted; and this made the whole tale unintelligible to the child.

The Bible if not distorted by narrow-minded bigotry is a rich mine for every one. The child's love for stories is satisfied, the historian finds records which are of the greatest importance for our knowledge of the patriarchal era of mankind, its customs and habits, its beliefs and superstitions, its laws and its culture. And above all, those who want to found their actions upon a firm basis of rules and principles, who aspire toward religious or ethical ideals, will find the most fertile fields in the books of the Bible, if they search in the right spirit, prejudiced neither by credulous acceptance nor flippant rejection of all their contents.

The Old Testament is one of the strongest supports of free thought, and the words of Christ are so full of truth and righteousness that they have rung through almost nineteen centuries and have not as yet lost their power. They have been wrongly interpreted, they have been scoffed at and ridiculed, they have been criticised and condemned, but they survived nevertheless, and will live on in the ethical development of humanity. The radical freethought of the Bible is perhaps not understood by those who say "Lord, Lord," who read and worship the letter and lose sight of the spirit.

Mr. Salter, the well known lecturer of the Society for Ethical Culture in Chicago, speaks in *The Christian Register* (Jan. 19, 1888) of the significance of Jesus for our time. He says: "The charm about the name of Jesus is that he dared believe in something different from what he saw about him. He loved justice in his soul, but with his eyes he saw injustice."

Christ's word, "Ye resist not evil," is a lesson to the human race which people even to-day have not yet understood. We are still prone to obey the old rule: "An eye for an eye and a tooth for a tooth." If one does injustice to another, this other thinks the best remedy is for him in his turn to do another injustice. It is almost an unwritten law of our social code "to render evil for evil and railing for railing." If the monopolist oppresses the workmen, the trades-unions expect to help themselves by committing a similar injustice. We must be educated to "a perception," as Wheelbarrow says, "strong enough to see that freedom to oppress others is not freedom." It will perhaps take some centuries for society to learn that the wrong-doer injures others and himself still more. He who seeks revenge by retaliating does not right the wrong but aggravates it. He intends to restore justice and increases injustice.

There are but few who can distinguish between an honest fight with their adversary and a hateful persecution of their enemy. The former is our duty, the latter is deplorable, and if done in a cowardly manner with the help of lies and slander, it is even despicable. So long as we stick to the old rule of rendering evil

for evil, every evil will beget a new evil. But if we let it alone, if we fight our struggles honestly without bearing any hatred toward our adversary, evil will be exterminated.

The real Christian is not he who believes the marvelous stories told in the Bible, but he who acts in accordance with the teachings of Christ, which finally must be recognized as true in their spirit and humane in their nature. They are right and correct and will outlast the worldly wisdom of retaliation. They will come to be recognized more and more, not only as noble and sublime from the ideal point of view, but also from the lower standpoint of practical prudence.

We would therefore call the attention of the free-thinker and of the bigot to the Bible. The one will find in store for him treasures of most radical thought, love of justice and truth, which he did not expect, and the other will learn that Christ was different from what he is generally represented in the orthodox pulpits. Our modern ethical civilisation is evolved from the biblical teachings and we have not as yet been able fully to comprehend all the ideas embodied in them, nor to realize them in actual life. Mr. Salter in the above quoted article says: "Religion must inspire to personal and social reform. That is the only thing that is religion in the modern world. All else is the tradition of an earlier time, when justice and judgment were committed to other hands than man's." \* \* \* "We cannot pray for justice any longer. We have to do it. We cannot say, Thy kingdom come. We have to obey the God who commands us to create it."

If any one who claims to be a teacher of free thought and ethical progress, disdains the prophets in the Old Testament, or the Doctrines of Christ in the New Testament, if he scoffs at his followers, the Apostles, Paul, Augustin or Luther, because they were in many respects not so far advanced as we are now, he seems to me like an engineer who foolishly prattles about the stupidity of Watt and Stephenson or other great inventors because their engines were poor in comparison to the engines of to-day. An engineer of such stamp will not become an inventor. Due reverence for and appreciation of the merits of the past is the only foundation on which a truly grand future can be built.

Radicalism is needed in our churches and our clergy should know that free thought—in its best sense—can never destroy religion, but on the other hand religion is wanted among our freethinkers. They should know that true religion is the most radical power of a consistent free thought which in constant opposition to narrow-minded bigotry leads humanity onwards in the path of progress.

P. C.

Evil is wrought by want of thought as well as want of heart.—Hood.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XIV.—Continued.

The north wind howled round the two neighboring houses, covered the window panes with ice flowers, but within doors one day followed the other with varied coloring and full of light, and each evening, more enjoyable than the other, passed over the heads of the happy couple, whether they were alone or whether the friends of the husband, the instructors of the people, sat with them at the tea-table where a simple meal was spread.

For the friends of her husband and their clever conversations are pleasant to the lady of the house. The lamp throws a festive light in Ilse's chamber, the curtains are drawn, the table well-furnished, and a decanter of wine is placed on it when the gentlemen enter. Frequently the conversation begins with trifles; the friends wish to show their esteem for the Professor's wife—one talks a little about concerts and another recommends a new picture or book. But sometimes they come out from the study in eager conversation; their discourse is not always quite within her comprehension, nor always very attractive, but on the whole it gives her pleasure and refreshes her mind. Then Ilse sits quietly there, her hands, which have been active in her work, fall into her lap, and she listens reverently. No one who is not a professor's wife can have any idea how charmingly the conversation of the learned flows. All can speak well, all are eager and all have a composed manner that becomes them well. Discussion arises and they begin to argue on weighty points, their opinions clash, they contradict each other, one says first black, the other white; the first shows that he is in the right and the second refutes him and drives him into a corner. Now his wife thinks, how will he get out of this; but she need have no anxiety, he is not at a loss—by a sudden sally he gains the advantage; then the other comes with new reasons and carries the matter still further, and the others join in, they become eager and their voices are raised, and whether at last they convince one another or each remains of his own opinion—which is frequently the case—it is always a pleasure to see light thrown on difficult questions on all sides. If one of them has said something really important and arrived at the heart of the matter, it puts them all into an elevated mood; it seems as if a supernatural light had burst in on them. But the cleverest of all, and he whose opinion is listened to with the greatest respect, is always the dear husband of the lady of the house.

Ilse, however, remarked that all the learned gentlemen had not the same amiable character. Some could not bear opposition and seemed in weak moments to consider their own importance more than the advancement of truth. Again, one would only speak and would not listen, and narrowed the conversation by

always returning to the point which the others had already surmounted. She discovered that even an unlearned woman could, from the discourse of the wise men, discern something of their character; and when the guests were gone she ventured to express a modest judgment upon the learning and character of individuals, and she was proud when Felix allowed that she had judged rightly.

In such conversations the wife of the scholar learned much that to other women remained incomprehensible. Thus there were, for instance, the Roman plebeians. Few women understand what that means. The old plebeians never gave tea-parties, never played on grand pianos, never wore hoop-skirts and never read French novels. This class is a very odious institution which has been buried in the ruins of antiquity. But the wife of a philologist is informed concerning all this. It would be impossible to recount all that Ilse heard about plebeians and patricians. Silently she sympathized with the plebeians. She entirely repudiated the idea that they consisted of insignificant people and a wanton rabble, and considered them to be sturdy farmers and fearless politicians who, in unison, valiantly fought against the unjust patricians to the very end. In connection with this she thought of her father, and at times wondered whether some of her acquaintances would have been plebeians had they been Romans.

The gentlemen were very friendly to her and almost all had one quality which made their intercourse very pleasant—they were always willing to explain. At first Ilse did not like to admit that she knew nothing of many subjects; but one evening she seated herself by her husband and began: "I have come to one conclusion. Hitherto I have been afraid to ask questions, not because I was ashamed of my ignorance, why should I be? but on your account, that people might not remark what a silly wife you have. But if you approve of it I will now do quite otherwise, for I observe that they take pleasure in talking and will be willing to favor me with a 'winged word,' as Homer says."

"Just so," said the husband; "they will like you the better the more interest you show in them."

"I should like to know everything about the whole world, in order to become like you; but I lack sadly the ability to comprehend."

The new plan answered admirably. Ilse soon learnt that it was easier to persuade her friends to talk than to desist from it. For they explained to her conscientiously and at great length what she wished to learn; but they sometimes forgot that the capacity of a woman who is receiving new impressions is not so fully developed as their own art of teaching.

They seemed to her to hover like gods over the earth. But they partook of the lot of the ambrosial society, for the pure peace which they sent into the

hearts of mortals did not always prevail among themselves and was easily frightened away by the throwing of the apple of the Goddess of Discord. It was Ilse's fate that soon after her arrival, when she was beginning to feel at home, a vehement feud broke out among the immortals of Olympus.

On a dark winter day the stormy wind beat against the window, concealing the adjacent wood behind clouds of driving snow. Ilse heard in her husband's room the sharp tones of Professor Struvelius in a weighty flow of eloquence, and at intervals the long and earnest talk of her husband. She could not distinguish the words, but the sound of the two voices was similar to the whirl of bird's wings or the rival singing of the thrush and the ill-omened crow. The conversation continued a long time and Ilse wondered that Struvelius should speak at such length. When at last he was gone, Felix entered her room at an unusual hour and paced silently up and down for some time, occupied in deep thought. At last he began abruptly:

"I am placed in a position that obliges me to communicate with my colleagues about our manuscript."

Ilse looked up at him inquiringly. Since her marriage there had been no talk about Tacitus.

"I thought it was your intention not to speak again of it to strangers."

"I have unwillingly broken my silence. I had no choice but to be frank with my associate. The realm of learning is unbounded and it does not often happen that associates in the same university pitch upon the same work. Nay, for obvious reasons, they avoid competition. If, therefore, by accident such a coincidence occurs, the most delicate consideration should be mutually shown by members of the same institution. To-day Struvelius told me that he knew I had been occupied about Tacitus and he requested some particulars of me. He asked me about the manuscripts that I had seen and collated years ago in other countries and about the fac-simile of the characters I had made for myself."

"Then you imparted to him what you knew?" inquired Ilse.

"I gave him what I possessed, as a matter of course," replied the Professor. "For whatever he may do with it is sure to be a gain to learning."

"Then he will make use of your labors for the advancement of his own! Now he will appear before the world in your plumes," lamented Ilse.

"Whether he will make proper use of what has been given him, or misuse it, is his affair; it is my duty to have confidence in the honor of a respectable colleague. That I did not for a moment doubt; but, indeed, another idea occurred to me. He was not quite open with me: he acknowledged that he was occupied with a criticism on some passages of Tacitus; but I feel certain that he concealed the most important particulars from me.

Nothing then remained to me but to tell him plainly that I have long had a warm interest in that author, and that since last summer I have been the more attracted to him by the possibility of a new discovery. So I showed him the account which first brought me into your neighborhood. He is a philologist, like myself, and knows now of what great importance this author is to me."

"My only consolation," said Ilse, "is that if Struvelius wishes to disinter the manuscript in our place, a hard fate awaits him at the hands of my sensible father."

The thought of the defiance of his stern father-in-law was consoling to the Professor, and he laughed.

"On this point I am safe; but what can he want with Tacitus?—his department was formerly not concerned with the historians. It can scarcely be imagined; but the most improbable things happen! Has the lost manuscript, by any accident, been found and got into his hands? But it is folly to worry about that."

He strode vehemently up and down and, shaking his wife's hand with great emotion, exclaimed at last:

"It is always disgusting to find oneself mastered by selfish feelings."

He again went to his work and when Ilse gently opened the door she saw him busy writing. Toward evening, however, when she looked after his lamp and announced the arrival of the Doctor, he was sitting leaning his head on his hand in moody thought. She stroked his hair gently, but he scarcely noticed it.

The Doctor did not take the affair so much to heart; but was very angry, both at the secret dealings of the other and at the magnanimity of his friend, and a lively discussion ensued.

"May you never regret this frank action on your part," exclaimed the Doctor. "The man will coin money from your silver. Believe me, he will play you a trick."

"After all," concluded the Professor thoughtfully, "it is not worth while to excite myself about it. Should he, by any improbable and unforeseen accident, really have come into possession of something new, he has a right to all the materials at hand—to what I have collected and to my assistance, so far as it is in my power to give it. If he is only exercising his acuteness on the existing text, all he may be able to accomplish will be insignificant as compared with our childlike expectations."

Thus imperceptibly and harmlessly did this cloud arise on the academical horizon.

A month had passed, and the Professor had often met his colleague. It could not be deemed strange that Struvelius never let the name of Tacitus pass his silent lips; nevertheless, the Professor watched the conduct of his colleague with concern, for he thought he noticed that the other avoided him.

One quiet evening Felix Werner was sitting with Ilse and the Doctor at the tea-table, when Gabriel entered and laid a small pamphlet, wrapped in a common newspaper, before the Professor. The Professor tore off the cover, glanced at the title and silently handed the pamphlet to the Doctor. The Latin title of this book, translated, was—"A Fragment of Tacitus; being a trace of a lost manuscript. Communicated by Dr. Friedobald Struvelius, etc." Without saying a word the friends rose and carried the treatise into the Professor's study. Ilse remained behind, startled. She heard her husband reading the Latin text aloud and perceived that he was compelling himself to master his excitement by slow and firm reading. The contents of this fatal writing must not be withheld from the reader.

Older contemporaries of the period in which tobacco was smoked in pipes, know the benefit of the paper-lighter, an invention which was commonly called *fidibus*; they know the normal length and breadth of such a strip of paper which our fathers formerly used to make out of musty old records. Such a strip, certainly not of paper, but cut from a sheet of parchment, had fallen into the hands of the author. But the strip had previously undergone a hard fate. Two hundred years before it had been glued by a bookbinder on the back of a thick volume, to strengthen the binding, and he had for this object covered it thickly with glue. On the removal of the glue there appeared characters of an old monk's writing. The word Amen and some holy names made it certain that what was written had served to promote Christian piety. But under this monk's writing other and larger Latin characters were visible, very faded, indeed almost entirely defaced, from which one could with some difficulty distinguish the Roman name Piso. Now, Professor Struvelius had, by perseverance, and by the employment of some chemical means, made it possible to read this under-writing, and from the form of the characters it was a work of antiquity. But as the parchment *fidibus* was only a piece cut from an entire sheet, it naturally did not contain complete sentences, only single words, which fell on the soul of the reader like the lost notes of distant music borne by the wind to the ear, no melody could be made from it. It was that which had attracted the author. He had ascertained and filled in the disjointed words and guessed at the whole of the remaining leaf. By the wonderful application of great learning, he had, from a few shadowy spots of the *fidibus*, restored the whole page of a parchment writing, as it might have read twelve hundred years ago. It was an astonishing work.

From this there was the following result: Most distinctly, although scarcely legible to common eyes, there had been written on the strip of parchment a certain Pontifex Piso—literally translated, "pea the bridge-maker." The parchment strip appeared very much oc-

cupied with this bridge-maker, for the name recurred several times. But the editor had shown from this name, and from the fragments of destroyed words, that the strip of parchment was the last remains of a manuscript of Tacitus, and that the words belonged to a lost portion of the Annals; and he had at last proved from the character of the shadowy letters that the strip of parchment did not belong to any extant manuscript of the Roman, but that it originated in one, quite unknown, which had been destroyed.

After reading the treatise the friends sat gloomy and thoughtful. At last the Doctor exclaimed:

"How unfriendly to conceal this from you, and yet to call upon you for assistance."

"That signifies little," replied the Professor. "But I cannot approve of the work itself; an over-great acuteness is applied to uncertain matter, and objections might be made against much that he has restored and supposed. But why do you not say openly what interests us both much more than the mistakes of a whimsical man? We are on the track of a manuscript of Tacitus, and here we find a fragment of such a manuscript, which has been cut up by a bookbinder after the Thirty Years' War. The gain which might accrue to our knowledge from this little fragment is so insignificant that it would not pay for the energy expended on it, being a matter of indifference to all the world except to us. For, my friend, if a manuscript of Tacitus has really been cut into such strips, it is in all probability the same which we have been in search of. What is the result?" he added, bitterly. "We become free ourselves from a dreamy vision which has perhaps too long made fools of us."

"How can this parchment be a part of the manuscript of our friend Bachhuber?" asked the Doctor; "many prayers have been written here over the old text."

"Who can assure us that the monks of Rossau have not written their spiritual aspirations over at least some faded sheets? It is not usual, but nevertheless possible."

"Above all, you must see Struvelius's parchment strip yourself," said the Doctor, decidedly. "An accurate examination may explain much."

"It is not agreeable to me to speak to him about it, but yet I shall do so to-morrow."

The day following the Professor entered the room of his colleague Struvelius more composedly.

"You can imagine," he began, "that I have read your treatise with especial interest. After what I have communicated to you concerning an unknown manuscript of Tacitus, you must perceive that our prospect of discovering this manuscript is very much diminished, if the strip of parchment has been cut from the leaves of a Tacitus which was preserved in Germany two hundred years ago."

"If it has been cut?" repeated Struvelius, sharply.

"It has been cut from it. And what you have communicated to me about this concealed treasure at Rossau was very indefinite and I am not of the opinion that much value is to be attached to it. If, in fact, there was a manuscript of Tacitus in existence there, it has undoubtedly been cut up, and this ends the question."

"If such a manuscript was in existence there?" retorted Felix. "It was in existence. But I have come to request you to show me the parchment leaf. Since the contents have been published there can be no objection to it."

Struvelius looked embarrassed and answered: "I regret that I cannot meet your wishes, which are certainly quite justifiable, but I am no longer in possession of the strip."

"To whom am I to apply?" asked the Professor, surprised.

"Even upon that point I am at present obliged to be silent."

"That is strange," exclaimed Felix; "and forgive me for speaking plainly, it is worse than unfriendly. For be the importance of this fragment great or little, it ought not to be withdrawn from the eyes of others after the publication of its contents. It is incumbent upon you to enable others to prove the correctness of your restoration of the text."

"That I allow," replied Struvelius. "But I am not in a position to enable you to see this strip."

"Have you sufficiently considered," exclaimed the Professor, excitedly, "that by this refusal you expose yourself to the misinterpretation of strangers, to charges which never ought to be brought in contact with your name?"

"I consider myself quite capable of being the guardian of my own good name and must beg of you to leave its care entirely in my hands."

"Then I have nothing further to say to you," replied Felix, and went toward the door.

In going he observed that the middle door opened, and the Professor's wife, alarmed at the loud tones of the speakers, made her appearance like a good spirit, with her hand stretched imploringly toward him. But he, after a hurried salutation, closed the door and went angrily home.

(To be continued.)

## Contents of Recent Numbers.

### THE ETHICAL BASIS OF CHARITY.

W. ALEXANDER JOHNSON.

The Editor of *The Reporter*, an organ of Organized Charity, Chicago, speaks not only from experience but takes the scientific aspect of this most vital problem. The basis of Charity must not be sought for in the sustenance of a pauper class who would not exist but for charity. The basis of Charity must be sought for in ourselves and our ethical nature. To this truth the principles and methods of doing the work of Charity must conform.

### THE INTERNATIONAL COUNCIL OF WOMEN.

MONCURE D. CONWAY.

A timely word about a remarkable and encouraging progress in the development of human kind.

### EVOLUTION AND IDEALISM.

PROF. E. D. COPE. In No. 23.

A very able statement of Positivism and scientific inquiry versus the imagination of a wrong Idealism. Prof. Cope treats this subject with perspicuity and strength. His essay should be compared with the Editorial of No. 35 "Idealism, Realism and Monism."

### REFLEX MOTIONS.

G. H. SCHNEIDER. In No. 24.

G. H. Schneider's book, *Der Menschliche Wille*, is one of the most prominent definitions of modern psychological research. The essay on Reflex Motions is a translation of the basic chapter of Schneider's work. It contains the fundamental propositions of physiological psychology.

### THE EDUCATION OF PARENTS BY THEIR CHILDREN.

#### THE ANIMAL SOUL AND THE HUMAN SOUL.

CARUS STERNE. In Nos. 22, 23 and 37.

Essays full of fine thought and psychological depth.

### FOLK-LORE STUDIES.

L. J. VANCE. In Nos. 22 and 23.

An interesting treatise on a subject which is at present attracting much and deserved attention.

### THE QUESTION OF IMMORTALITY

Is treated in the Editorial of No. 25, "Evolution and Immortality." It is shown that Immortality according to the Monistic view is immanent; it is a continuance of ourselves in our children, in our ideas and in the work we have done during life. Rudolf Weyler in his essay "The Process of Paucity" in No. 24 speaks of death as a mere transition and C. Billups in a letter of No. 25 criticizes the wrong notion of a transcendent immortality as taught by Dualism.

### DETERMINISM VERSUS INDETERMINISM.

PROF. GEORG VON GIZYCKI. In Nos. 25 and 26.

George Von Gizycki is Professor of Philosophy at the University of Berlin. His name is well known beyond the boundary of his country. The problem of the Freedom of the Will has perhaps never been treated in a clearer and more forcible manner. Contributions on the same subject may be expected from E. P. Powell and Xenos Clark.

## THE OPEN COURT,

PUBLISHED EVERY THURSDAY BY

### THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE OPEN COURT is devoted to the work of conciliating Religion with Science. The founder and editor have found this conciliation in Monism—to present and defend which is the main object of THE OPEN COURT.

THE OPEN COURT has for contributors the leading thinkers of the old and new world.

Translations from the most prominent authors of Europe have been prepared, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social and economic questions.

TERMS, \$2.00 PER YEAR. \$1.00 FOR SIX MONTHS  
\$0.50 FOR THREE MONTHS. SINGLE COPIES, 10 CTS.

All communications should be addressed to

### THE OPEN COURT,

## TRUSTS AND UNIONS.

BY LYMAN J. GAGE.

Human society is not the result of an invention. It has been a growth, a development, an evolution. The present is the outcome of all the past; it embodies in itself—its customs, ideas and institutions—the result of every influence that has ever operated on man. His appetites, passions, desires, ambitions, aspirations, prejudices and superstitions, have affected the social whole, and have been contributing to and modifying the great stream of human history, and every one of us as individuals and society as a whole, are what we have been made by all the influences of all the past. We can look back, indeed, and discover where ideas first springing up in a single mind have become incorporated in the general thought, have gradually changed the current of the social drift, and finally modified or completely changed social and political institutions. Thus we can read of barbarism with its despotic rule of the tribal chief merged into the fairer form of the feudal system, this in turn slowly developing into a broader state, with the rights of the common people enlarged, though still subjected to kingly rule. At last, after many struggles along a path often marked with blood and tears, we come to the new western world. Here, at last, man stands upright, bathing his forehead in God's free air, the charter of his liberty fully written in the great declaration that all men are born free and equal, and possessed of a common right to life, liberty and the pursuit of happiness.

As man has made progress in this movement towards physical and political freedom, we perceive a like advancement towards intellectual independence. The rising sun of christianity drove back the clouds of pagan superstition, and brought to light the true dignity of man as a moral being, and revealed a nobler Deity. The Reformation broke the power of a dominant religious-political church, disposed to hold in mental subjection those it had made free from the oppressive influence of pagan superstition; and finally modern rationalism has purified the reformation, and promises to free the mind from bondage to spiritual tyranny of every kind.

If it be true that we are what we are by inheritance, rather than by direct creation, we certainly have reason to rejoice in our heritage. Recipients as we are of rich endowments from the past, we find room for their active

use under peculiarly happy circumstances and conditions.

This country in which our fortunes are cast is the fairest on earth. Its great area gives a variety of soil capable of yielding all things necessary to its people. Its climate is so varied that every phase of physical constitution can find an agreeable home. Its wealth of forest is great, and the treasures of mineral wealth beneath the surface are inexhaustible. With a population of sixty millions it is sparsely settled, and will support under good industrial conditions two or three hundred millions in peace and plenty. In addition to all that has gone before, we have the immense power gained in the knowledge of physical science. Steam, electricity, and manifold mechanical inventions have become the willing servants of man.

Concurrently with the development of mechanical inventions, we have witnessed growing economies in the distribution of the products of industry, and a corresponding improvement in the actual and relative reward to the class that the division of labor has developed, known as wage earners. In McMasters' History of the United States, it is stated that in the year 1800 the wages of common labor at Albany, N. Y., were 40 cents, and the hours of work were from sunrise to sunset. Careful statistics compiled for the last twenty-five years show that the wages of skilled and common workmen have both largely advanced, while the purchasing power of their earnings has increased by reason of a lower price for commodities. A common laborer can now buy sixty-six per cent. more of the necessities of life with the earnings of one day than in 1865. Factory operatives, men and women, can buy seventy-eight per cent. more. Common mechanics can buy ninety per cent. more; and men of special skill and aptitude over 100 per cent. more. In other words, the economical value of labor to labor's benefit has increased within twenty-five years by about seventy-five or eighty per cent. It is interesting to note that the accumulation in savings banks, an accumulation due mostly to the industrial classes, is larger than the total deposits of the National banks, though an important per cent. of the latter is also due to the industrial instead of the strictly commercial community.

Surely, if Washington and his fellow founders of the great Republic could return from their long sojourn

in the land of shades; if they could take a hasty glance over this broad land, and see its people increased from four to sixty millions, on every hand peaceful homes, smiling villages, or magnificent cities, all as yet bound together by the political fabric of the early constitution, how would they exult and rejoice. In imagination, we can hear them say:

"We builded indeed better than we knew; but we are the more fully justified in having staked everything on this great experiment. It was to secure this that we put our lives in peril, and what was harder still, we braved the opinion of a world where hereditary rule and aristocratic privilege held full sway. Here exists, indeed, in full power, the peer of any nation, the ideal state of which we dreamed. Man free; the maker of his own destiny; no repressive laws to paralyze his energies; no mandatory laws to compel his action. Our belief that man, man as an individual, could be trusted to work out for himself the high ends of his being is vindicated. Left free, he has by individual action or by voluntary association created the highways of commerce, explored the mountains, subdued the wilderness, established a broad education, developed science, art and literature. By the force of a natural unfolding, not by governmental dictation, he has diversified his industries to the many forms to which different individuals ally themselves according to impulse, taste and aptitude which lie within themselves. The political constitution we gave them is elastic and flexible; it will answer all future needs because, being made for society, it is responsive to the social will, and by its own terms it may be changed when the majority shall desire. We have thus removed any excuse for internal violence, we have clothed the ballot with the convincing power of the bullet, therefore revolutions are impossible. The minority against the majority are defeated before the strife begins. The present is prosperous, the future is secure. Let us return to the land of rest, from which we gladly came that we might gain this brief glimpse of the fair fruits our eyes have seen."

In this flight of fancy it is indeed a kindness to permit these patriotic fathers, whom we all love and venerate, to return to their well earned rest after this brief review. It would be unkind to detain them here and awaken their anxieties by darker pictures which their brief review did not discover. For there is enough left to have excited them and to give serious concern to us, upon whom the responsibility of the present generation rests, and to whom are committed the things which must shape the future.

In 1877 the first great expression of industrial revolt against established order appeared. Within ten years new conditions seem to have arisen. Labor, dissatisfied with the results of the free operation of

the law of supply and demand, in its effect upon the individual, has become organized. Trades unions have become firmly established. By rules of their own, they endeavor to control the hours of labor, the rates of compensation, and to limit and restrict the number of those who by apprenticeship shall become competitors in the future. These unions now cover nearly every form of mechanical industry.

The Knights of Labor is the name for a larger organization seeking to bring into one great body every form of labor to which the hand and body is applied.

On the other hand, we are now witnessing combinations of employers, especially of those engaged in manufacturing. These combinations are known as "Trusts," and every day brings forth a new combination, though many are so quietly effected, or so artfully concealed, that the fact escapes observation and comment. The aim of the labor organization is to check the depressing influence of wages of individual competition. To secure this end the individual surrenders himself to the organization, obeys its mandates, and accepts as his compensation the rates that the representatives of his organization, by the influence of the combination, may secure. If he asserts his independence, and refuses adhesion, he is kept under the observation of the walking delegate, and should his individual efforts come into competition with, or seem to antagonize the interests of the order, there are means found to reduce him to subjection.

The Trust organizations are the same in spirit. Confined to a limited market, a multiplicity of factories produce beyond the ability of the market to consume. Competition to sell reduces prices, diminishes profits, and threatens ruin to the weakest. The aim of the Trust is to check the depressing influence on profits of individual competition. To secure that end, the individual or corporation surrenders his establishment to the Trust, obeys its mandates, and accepts as his profits the result of the price that the "trust" may be able to secure.

Thus it is apprehended there will soon be brought face to face, like hostile forces, the two great powers—the labor organization, or the employes, overwhelming in the number of their rank and file, and the labor employer—comparatively few in number, but powerful in the advantage of position.

We have said that the aim of the Trusts is to secure higher profits. The method will be naturally in two directions, by reducing cost, and by raising prices. The aim of the labor organization is to raise wages. This method will be in one direction only, and that against the employer; hence the antagonism. Organized into trusts, the employing class can in fact, and perhaps will, yield to the increased exactions of the employes; for enjoying, for a brief period at least, a

practical monopoly in their respective industries; can they not fix the price so as to cover both the increased cost and the increased profit? Indeed, if this scheme of combination, this new and artificial system, were practical, labor organizations ought to hail with satisfaction the creation of the Trust, and for this reason: If the employe were able to enforce his growing exactions against the employer, at the employer's cost, the latter would soon be exhausted, and his industry would cease; but if by trust association the employer can recoup himself upon the community at large, then the labor organization has a larger and more inexhaustible field from which to gather a larger reward, and the employing trust might be its convenient and needful agency. But the trouble is, these artificial systems, if wrongfully used, will break down. Thus used they are against the natural order, and the natural order is more powerful than man's devices.

If these trust organizations, by a materially increased price, secure to themselves a larger return upon capital than its average use in other directions will afford, two reactionary effects will be produced: First: The increased cost of their commodities will operate to reduce the ability of the community to consume, and thus reduce the volume of the output. Next: In a free state like ours, unusual profit in any given direction will attract new capital as surely as effect will follow cause, and through new invasions of capital the monopoly will at last be broken.

The same is substantially true as to the result of labor organization, if it shall operate to secure to its members unusual or extraordinary advantages, whether by money payment or by reduced hours of labor. Take the mason's calling, if you please, and suppose the daily wages of that class were, by a close combination, forced up to ten dollars per day, with a prospect of permanency in the prices, is it not plain that laborers now engaged in agriculture or in other departments of industry would learn that trade? They would learn it if they had to employ teachers, and practice by moonlight in the open fields. Partially or fully taught, the number of masons would soon increase, offer their services independently at reduced rates to secure employment, or else the brotherhood of masons would be obliged to take into their existing organizations these new competitors. The craft would have to take care of the craft, and those employed at the high price would have to divide with the unemployed until a mutual average of return was reached where no newcomers would be tempted into it. While this effect was being felt, another consequence would appear: the increased cost of building would reduce the number of buildings and lessen the demand for mason work; and between these two influences the artificial advantage to the mason trade would disappear.

This illustration may be universally applied. These efforts of labor to secure to itself better rewards have their origin, no doubt, in a true principle—half perceived, it is true—but a principle which has governed, and will always govern in a free State, the rate of wages, namely: The wages of labor will rise and fall as the number of wage-workers increases or diminishes in relation to the existing quantity of capital. If capital increases in a greater ratio than the population, wages will rise. If the population increase in a faster ratio than capital, wages will fall. No combination, nor any number of them, can long resist the silent but irresistible influence of this principle.

If this principle were fully comprehended, it would teach the wage-earner that an increased capital in the country will insure to his and his children's advantage. It will teach us all that marriage too early entered upon, and marriages too prolific, are influences which have always held society down to the minimum of wages and comfort and to the maximum of toil and labor. But the effect of the trade union to raise wages by barring out from the exercise of their natural right a number of the population, so far as it may succeed, will have the effect to utterly degrade that part of the population, which will thus find every door of remunerative employment closed before it. Doomed to a life of enforced idleness, this remnant must be supported. The fund for its support must come out of the annual earnings of productive industry. The suggestion concerning too early and too prolific marriages is by no means a new one. In the trade corporations of the middle ages, at their most vigorous period, their by-laws and regulations were conceived with a vigilant eye to the advantage which the trade derived from limiting competition, and they made it the interest of artisans not to marry until after passing through the stages of apprentice and journeyman, and attaining the rank of master. In Switzerland, the Council of State, in five Cantons, elected by universal suffrage, have passed laws by which all young persons who marry before they prove to a magistrate of their district that they are able to support a family are rendered liable to a heavy fine.

But this new movement of labor combination and capital combination must go on until the experiment has been fully tried and its results practically determined. Repressive legislation ought not to be hastily invoked. Lord Macauley truly said: "There is only one cure for the evils which newly acquired freedom brings, and that cure is freedom."

The labor organizations have in them, it is true, possibilities of great value. By friendly union they strengthen the bond of sympathy which man should everywhere feel towards his fellows; with fraternal union they enable labor to practically test from time

to time the question as to whether labor is really receiving its fair, marketable reward. Employers are never in haste to advance wages, and are perhaps as often reluctant to force them down. The price of labor, like the price of labor products, must be adjusted by what is called the "higgling" of the market. A peaceable strike is a practical test, one that should be made, when made, without passion, and be followed, as all strikes are, by concession from one side to the other, but by concessions which, when made, should cause no humiliation on either side.

The dealer in commodities offers his goods or wares; the market, perhaps, will not take them at his price; he holds off until concession from the would-be seller, or concession from the market is reached, and the trade is accomplished. No stones are thrown, no bad blood is excited. In its economical aspect, the effort of labor to find its highest market price is a transaction not essentially different. There are signs that this view is growing in favor with labor organizations; and with increasing knowledge and a better study of the natural economical conditions which govern the price of labor, as if everything else, many of the evils which might be pointed out as incidental to these organizations will disappear.

The Trust Organizations are not necessarily evil—perhaps not even dangerous. They may, in fact, if wisely conducted, be productive of good. Economy in the use of capital, efficiency in methods and administration, increases production, reduces cost and gives room for higher wages to the operative whose labor is thus increased in efficiency. These results may be best secured through combinations, whether of individuals or corporations. It is quite certain I think that in this direction only will the co-operative movement known as trusts have an enduring history. If they *do* accomplish these results they ought to and will survive.

Every generation has its especial problems to solve, and its own difficulties to encounter. Our problems and difficulties seem largely related to social and industrial economics. With an advancing civilization the age has become more humane. Extremes of poverty and distress which in a coarser age were scarcely noticed, now pain the heart. The structure of society which can show such disparity between the condition of the very rich and condition of the very poor is boldly challenged—nay more, it is vehemently denounced as being radically bad in its fundamental principles. Such writers as Owen, St. Simon, Louis Blanc, Fourier and others, have formed mental conceptions of a social state which should be free from the poverty and wretchedness which, like dark spectres, have haunted civilization from its earliest beginning to the present time. The thoughts and ideas

advanced by these teachers, men of learning and philanthropy, have taken hold of many minds; and in various forms, but under the general name of socialism, efforts are made to bring these individual conceptions into some form of practical realization.

I shall not attempt to debate the merits or demerits of the new and untried theories, but I cannot forbear to quote the careful and considerate words of one who is often named as favorable to socialistic ideas. He says: "We must suppose two conditions realized without which neither communism nor any other laws or institutions could make the condition of the mass of mankind other than degraded and miserable. One of these conditions is universal education; the other a due limitation of the numbers of the community. With these conditions realized, there could be no real poverty under the present social institutions; and these being supposed, the question of socialism is not as generally stated by socialists, a question of flying to the sole refuge against the evils which now bear down humanity, but a mere question of comparative advantages. We are too ignorant either of what individual agency in its best form, or socialism in its best, can accomplish, to be qualified to decide which of the two will be the ultimate form of human society. But it is not by comparison with the present bad state of society that the claims of communism can be estimated; nor is it sufficient that it should promise greater personal and mental freedom than is now enjoyed by those who have not enough of either to deserve the name. The question is, whether there would be any asylum left for individuality of character; whether public opinion would not be a tyrannical yoke; whether the absolute dependence of each on all, and surveillance of each by all, would not bring all down into a tame uniformity of thoughts, feelings and actions. This is already one of the glaring evils of the existing state of society, notwithstanding a much greater diversity of education and pursuits, and a much less absolute dependence of the individual on the mass, than could exist in the communistic regime. It is yet to be ascertained whether the communistic scheme would be consistent with that multiform development of human nature, those manifold unlikenesses, that diversity of tastes and talents, and variety of intellectual points of view, which not only form a great part of the interest of human life, but by bringing intellects into a stimulating collision, and by presenting to each innumerable notions that he would not have conceived of himself, are the mainspring of mental and moral progression."

The truth is, society has advanced but half way along the high course which a practical idealism sees possible to it. The forces of nature are fairly comprehended, and by putting his mechanical appliances

in the line of their action, the power of man has been indefinitely multiplied. Steam and electricity do his bidding. The winds carry his ships; and even the rising and falling tides turn the wheels of his ponderous engines. Having secured a large dominion over nature; having learned the secrets of the stars, and found the mysterious orbit of his earth, he must now turn his thoughts and his study to that organism we call society. He has now to learn the more subtle laws which affect man in his industrial and social conditions and history, and to these few inexorable laws society in all its members must learn a willing obedience.

The ingenuity of the past has been taxed in the effort to discover and apply adequate punishment for crime. The study of the future will be the prevention of crime. There have long been efforts made to ameliorate the sufferings of pauperism: we ought to learn—we shall finally learn—to change the conditions by which absolute poverty or complete pauperism exist. Proof enough exists for our present low state in the fact that an average of four or five thousand men in the State of Illinois are inmates of jails and penitentiaries,—in the fact that in a city like Chicago, where only two millions per annum are expended in public education, twenty millions or more are expended for beer,—in the fact that masses of man roam our streets in vain quest of remunerative and steady employment. Unskilled in handicraft, and enfeebled too often by the destructive effect of drink, their value to society is but small; and they hang upon its skirts, begging for help, while they sink into unknown and unhonored graves. The hopeful sign of the present, and the best promise for the future lie in the fact that society is becoming awake with redemptive zeal.

One society in New York within thirty-five years has taken more than eighty thousand children from conditions which condemned them naturally to ignorance, poverty and possible crime, and placed them in good homes throughout the land, where they have grown or are growing up, under conditions favorable to virtue and intelligence, and to a life of usefulness and honor. The annual receipts of that society have steadily increased from about four thousand dollars in 1853 to more than three hundred and fifty thousand dollars in 1887. This society runs twenty-one day and fourteen evening schools, where 10,827 children of misfortune are taught and partly fed and clothed.

Does not the operation of this society and others of similar aim have something to do with the following results: In 1859 the commitments for female vagrancy in the City of New York was 5,778. To have maintained a similar ratio to population, the number of commitments in 1886 for the like offense, should have been a little over ten thousand—but the number was only 2,418, or less than half the number of 1859.

In 1875 the arrests for drunkenness among males was 24,786; in 1886 the number was 12,500.

I cite these facts as encouraging evidence of the propositions, first: That the more degraded part of the population are slowly learning the difficult duty of self-restraint, and, second: That the more enlightened and prosperous classes are apprehending more clearly their responsibility to their feeble brethren. To the honorable and right-minded socialist we must, perhaps, accord the strongest conception of the solidarity of society, but the believer in the rule of individual free agency, he who opposes with all his power the prescriptions of socialism, he also is beginning to comprehend that in the web of social life his own happiness is inextricably involved in the welfare of his fellow man; he is apprehending a great, a divine truth—that outside of himself there is a larger self-humanity; that in the exclusive service of his narrower self he is leading a life too restricted for his highest happiness.

In the development of two principles, self restraint and self control in the individual, and a broader humaneness, a more generous sympathy prevailing society, lies the hope of the future. Whether socialism or communism is to be the final and distant destiny of society, or whether it is to go on forever under the influence of individual agency, we need not be over anxious to know. It will develop according to the law of its inherent tendencies, modified by the ideas and influences of the present and of new generations. Man, the individual, dies. If he lives only to himself he soon passes away, and nothing of him remains upon earth. If with high ideals and pure sympathies he lives for society, by so much he pours his being into an urn that will never be broken. Society is immortal.

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M. D.

Part VII.

#### DIET.—CONTINUED.

It would be difficult to name a single moral or mental emotion that cannot be stimulated (or *simulated*, as a certain school of moralists would prefer to express it) by the purely physical agency of tonic drugs. Thus, a penchant for *mysticism*, a propensity that has played no small part in the propagation of religious dogmas—can be excited by an over-dose of *belladonna*. The patient's eyes stare with dilated pupils, while the brain becomes crowded with curious visions, connecting every trifling phenomenon with a transcendental significance. Spirit-hands beckon from the branches of a swaying tree; the clouds frown portentously; the voice of the nightwind whispers weird secrets; the soul seems to listen for supernatural rev-

\* Copyrighted.

elations and derives inspiration from incidents as prosaic as that flash of sunlight reflected from the burnished surface of a wash-basin, that filled the heart of Jacob Boehme with a "beatitude born of spheres beyond our own."

A small dose of *chloral* will cure pessimism as promptly as it relieves the physical symptoms of certain nervous disorders. The mind seems incapable of dwelling on the gloomy aspects of life, and expands desires into hopes, and hopes into exultant foretastes of enjoyment. A diluted preparation of hasheesh will produce a similar effect.

"It is real happiness," says Dr. T. C. Moreau (*Etudes Psychologiques*, p. 54), "which characterizes the first effect of hasheesh, and by this I understand an enjoyment entirely moral, and by no means sensual, as one might be led to suppose. This is certainly a very curious circumstance, and some remarkable inferences might be drawn from its significance; this for example, that every feeling of gladness and gratification, even when its causes are purely moral,—that those joys which are least associated with material objects, the most spiritual, the most ideal,—may, after all, be nothing else than sensations wholly physical, developed in the interior of the organism, as are those produced by the hasheesh. At least, as far as concerning anything of which we are internally conscious, there is no distinction between these two orders of sensation, in spite of the diversity in the causes to which they are due; for the hasheesh-eater is happy, not as the gourmand, not as the libertine in gratifying his sensual desires, but like him who receives tidings of great joy, like the miser counting his treasures, the gambler in a flush of good luck, or the ambitious man intoxicated with success."

In larger doses the same drug stimulates the amatory passion and combativeness; while its after-effects are attended with gloomy forebodings, bordering on that monomania of dread which sometimes torments lunatics with hallucinations of pursuing demons or lurking assassins.

The despondency of alcohol drinkers, too, is apt to assume the form of absolute life-weariness. The gloomy reveries of mediæval fanatics, their dread of tempting fiends, their broodings over the horrors of future retribution, may be partly explained by the habits of an age that combined spiritual tyranny with the utmost license of spirituous indulgence. Not more than a generation ago the Protestant countries of Christendom, too, abounded with morbid moralists who vented their alcohol-spleen in fierce pulpit diatribes and dire predictions of retributive calamities. The suspicious temper of confirmed drunkards is as apt to eventuate in deeds of violence as their despondency is prone to temptations of suicide. Dr. W. B.

Carpenter mentions the case of a sea-captain, who "having been seized with the belief that his crew was in a state of mutiny, killed one of them after another, in (as he believed) rightful self-defense." Dean Swift, who tried to relieve (but probably aggravated) his chronic headaches with alcoholic stimulants, suspected every strange visitor of hostile intents, and often accused his best friends of "conspiring for his ruin." This diseased imagination exaggerated inadvertant slights into deliberate insults, and his self-written epitaph expresses his almost impatient longing for the peace of that last resting-place, "*ubi sæva indignatio cor ulterius lacerari non potest*"—"where fierce resentment will no longer rend my heart." Yet, the fact is, that the causes of that "resentment" were chiefly chemical. Instead of conspiring for his ruin, his friends did all they could to condone his faults, and his most unclerical escapades were forgiven so often, that his superiors at last incurred the reproach of undue partiality, or of a purillanimous dread of incurring the enmity of the virulent satirist.

The sufferings of the opium-fever, on the other hand, consist in an abnormal sensibility of the whole emotional organism. The mind does not exclusively dwell on gloomy fancies, but wanders from vision to vision, from abysses of darkness to scenes of bewildering splendor. "All sorts of vivid thoughts," says De Quincy, "were apt to transfer themselves to my dreams, till I almost feared to exercise this faculty; for, as Midas turned all things to gold, that yet baffled his hopes and defrauded his human desires, so, whatsoever things capable of being visually represented, I did but think of in the darkness, immediately shaped themselves into phantoms of the eye; and by a process apparently not less inevitable, when thus once traced in visionary colors, like writings in sympathetic ink, they were drawn out by the fierce chemistry of my dreams into insufferable splendors that fretted my heart. . . . I sometimes seemed to descend, not metaphorically, but literally, into chasms and sunless abysses, depths below depths, from which it seemed hopeless that I should ever re-ascend. The sense of Space, and in the end the sense of Time, were both powerfully affected. Buildings, landscapes, etc., were exhibited in proportions so vast as the bodily eye is not fitted to receive. Space swelled, and was amplified to an extent of unutterable infinity. This, however, did not disturb me so much as the vast expansion of Time; I sometimes seemed to have lived for 70 or 100 years in one night; nay, sometimes had feelings representative of a millenium passed in that time, or, however, of a duration far beyond the limits of human experience. The minutest incidents of childhood, or forgotten scenes of later years, were often revived; for I could not be said to recollect them.

If I had been told of them when waking, I should not have been able to acknowledge them as part of my past experience, but placed, as they were, before me, in dreams, like intuitions, and clothed in all their evanescent circumstances and accompanying feelings, I recognized them instantly."

Tartars, under the influence of koumiss (fermented mare's milk), become absurdly garrulous. A stern, old chieftain will unbosom himself to his groom, detailing his financial projects or the record of his gallantries, or assemble his companions under the impulse of an irresistible hankering for a display of oratorical talents.

Arsenic-eaters become introspective, preferring their silent reveries to the most entertaining conversation; *coca* (a Peruvian tonic) beguiles the hunger of the poor Sierra Indians with visions of luxurious feasts; and Dr. Laycock (*Mind and Brain*, vol. I, p. 422) mentions *phantasmagorias of harmony* among the curious effects of a dose of *aconite*. "On a certain night," he says, "when a sufferer from severe pain and great weakness, the writer took one drop of Fleming's tincture of *aconite*, and slept. About midnight he became sensible of a novel state of perception, obscure at first, but shaped at last into strains of grand ærial music, in cadences of exquisite harmony, now dying away round mountains in infinite perspective, now pealing along ocean-like valleys. Knowing by previous experience that it must be a hallucination, he at last listened to ascertain the cause, and found it was the rattle of a midnight train entering an adjoining railway station. Thus, under changes induced in the Brain, by a drop of a tonic tincture, the harsh rattle of the iron vibrating on the air in the silence of a summer night was changed into harplike ærial music, such not only as 'ear had not heard,' but no conceivable art of man could realize. Associated therewith was also a suggested terrestrial vision of space of infinite extent and grandeur."

A decoction of the common fly-toadstool (used for intoxicating purposes by the natives of Kamtschatka) affects both the memory and the sense of space. In his delirium, the toper will repeat the same anecdote till the impatience of his hearers explodes in an emphatic protest against further rehearsals, and in trying to cross a tiny rill, he will often take a leap sufficient to clear a goodsized brook.

Wrath, love, fear, fancy, wonder, sadness and self-esteem, can all be stimulated by the influence of as many different drugs. It would, indeed, be no exaggeration to say that by changes of diet and the skillful use of chemicals a moral experimenter can play on the emotions of the human soul, as a skillful performer would manipulate the key-board of a musical instrument.

#### PROFESSOR L. BUCHNER ON RELIGION.

Prof. L. Büchner, the well-known author of "Force and Matter," has recently published a pamphlet,\* "*Ueber Religiöse und Wissenschaftliche Weltanschauung*," in which he denounces religion as being a belief in a supernatural world.

Prof. Büchner is quite justified in so severely criticising religion, if the word has to be accepted as he defines it, "superstition or worship of a supernatural deity." He has stated, however, on page 8 of his pamphlet, that, in his polemical treatment of religious cosmic conceptions, he has reference to the construction of the word "religious" as based upon ecclesiastical and denominational principles only, and in a private letter he gives us his opinion of our view as follows: "In the main I quite agree with your views upon the subject, and have no objection, furthermore, to your retaining the word 'religion' in the corrected sense in which you have conceived it; although the distasteful notion incidentally attached to the word may indeed restrain many from indorsing your opinions. A further dubious circumstance is the limitless confusion of ideas connected with the word 'religion.' You will find enclosed a short essay of mine upon the meaning of the word, which was the occasion of a number of articles upon the subject in '*Menschenhum*' and other free-thought journals; yet we were unable to come to any agreement. The views expressed stand in marked opposition to each other, although the whole controversy is at bottom but a verbal one, and everything depends upon what we propose to understand or not understand by the word religion. Yet you may see, by the passage italicised in my essay, that I, for my part, have no objection to offer against the further use of the word in the free-thought acceptance."

"If I may be allowed to take exception here to your definition, it will be that I deem it too indefinite and not sufficiently realistic. The 'All' is a notion entirely too indefinite, a thing which we know but very imperfectly and only in portions, and behind which all manner of other things may lie concealed. As for the rest I fully agree with you, when you characterize your move as a religion of humanity. The '*Allgefühl im Einzelnen*' referred to humanity, the '*Leben für die Gesamtheit*' (living for the entirety) is indeed a beautiful, a truly socialistic idea, which I assent to with all my heart.†"

The passage to which Prof. Büchner alludes, reads as follows: "Opposed to the belief in the supernatural stands, of course, the belief in the natural: the belief that everything in the world has, does and will happen

\*This pamphlet was reviewed in THE OPEN COURT of October 13, 1887, p. 503, by Mr. Fred. May Holland.

†Prof. Büchner refers to the definition of religion given in my contribution to the "Freidenker." The "*Allgefühl im Einzelnen*" is untranslatable as a definition. The literal rendering, the "All-feeling in the (individual)," does not accord with the English idiom. The idea, however, is given at length in the closing paragraph of this article.

conformably to the everlasting and immutable laws of nature, in accordance with the law of cause and effect, and without the possibility of a personal interference. This is the belief, or—to take the word in its broadest meaning—the religion of the free-thinker. *For the free-thinker, too, has a religion, or can have one, if he understands by that word the belief in the happiness, weal and progress of the human race on earth. In a certain sense this belief also is 'supernatural,' for it extends beyond the natural condition of man, and exalts him to a sphere which conforms to laws of higher—even if self-created—potentiality. The difference between the 'supernatural' of those who confess God and religion and the 'supernatural' of the free-thinker rests solely in the fact that the one searches for it above and the other beneath the clouds.*

"In this sense the definition named would be applicable to a religion which had no truly religious conceptions, or to a general belief in the ultimate triumph of the true, the good and the just, and it would thereby meet the demands of those who fancy they possess religion without theistical admixture, or who find their confession of faith in Schiller's famous saying:

"Which religion I have? There is none of all you may mention Which I embrace; and the cause? Truly, religion it is!"

In all main points Prof. Büchner agrees with our standpoint; his only objection is that the expression, the All, is, according to his idea, too vague; he prefers to restrict religion to man's duties and relations to mankind. We do not question that the duties toward humanity are the most important and most difficult of religious relations; yet they do not include all. Man's relation to the animal kingdom, and even to the inanimate world, also implies moral duties.

Felix L. Oswald inculcates this truth in his essays, and he proves beyond the possibility of a doubt how it is that man's conduct in relation to surrounding nature, his eating and drinking, his taking exercise, etc., must also be regulated according to moral principles, all of which must be included in a monistic religion. The monistic religion, we confidently believe, will prove to be a "humanitarian religion" and the "religion of humanity"; but we expressly state that this name must not be considered as limiting religion to the relations between man and man. All actions of man have a moral import, and therefore his religion must comprehend all his relations. In order to cover the whole field of man's duties, the definition of religion must be as broad as possible, and therefore the expression "the All" seems to us more appropriate than any other term. It is the most general term, yet not vaguer or more indefinite than any other word which could perhaps be substituted. It is at the same time signally realistic—as realistic, at least, as any name. It includes not only what we know of nature at present, but whatever

acquisition or eventual increase of our knowledge we can attain.

With regard to Prof. Büchner's expression that the religion of the free-thinkers is "the belief in the happiness, weal and progress of the human race on earth," we have to offer two objections: First, "happiness" denotes a state of mind which is too subjective and indefinite to be of any use for a definition. The happiness of an immoral man is different from the happiness of a moral man; and under certain conditions it is possible that the very unhappiness of both will contribute to their weal and progress. Unhappiness will benefit the moral man, and may mend even a bad man; happiness, on the other hand, is dangerous and objectionable as soon as it comes in conflict with the weal and progress of ourselves as well as that of the human race. We would accordingly suggest that the word happiness be canceled altogether in the passage quoted.

Our second objection refers to the word belief. According to our view religion is independent of belief—it is a fact of human nature. The naturalist knows that everything stands in some relation to everything else in the world. The whole universe does not consist of single things disconnected, but forms a great unity, and there is no atom that does not conform to this universal law of mutual relation; no particle of dust exists that does not gravitate toward other masses according to its weight. The relations of animals to the universe are infinitely more complicated than the relations of inorganic matter, and the relations of man to his surroundings grow in import as he becomes conscious of them. Man by dint of his thinking and reasoning power is enabled to judge better of, and understands that his actions must be regulated by, these relations.

The scientist inquires into the phenomena of nature, but in his observations he does not take into consideration that he himself is personally concerned in the life of nature. Science is objective. But when man considers himself a part of the whole natural world, when he comprehends that his actions have an effect upon his surroundings and react upon himself and his fellow-beings, when in consequence thereof he feels himself responsible for his conduct, when he knows that his conduct is to be regulated, not at his pleasure, but according to his relations to the All, he is religious. Religion is subjective.

Science and religion both embrace the whole field of nature and natural life. Science and religion never cease to influence each other, and the progress of the one promotes the progress of the other. No science without religion. The greatest discoveries have been made by men of deep religious feeling, by earnest lovers of truth, by men who did not live for themselves, but for truth and for the discovery of truth, viz.: science.

But we say also, no religion without science. Religious belief rests on certain scientific notions.

Science is a fact of human nature, and so is religion. Wrong notions do not annihilate science, nor do superstitions destroy religion. The prevalence of errors does not prove the non-existence of either religion or science. Truth will remain truth, even if obscured by misconception. Accordingly, we do not demand the extermination but work for the purification of religion as well as science.

There is dogmatism in religion as well as in science, and there is agnosticism in religion as well as in science. But there is also an undoubted progress in religion as well as in science, and this progress is effected by a constant struggle against the two extremes, dogmatism and agnosticism.

Accordingly, we define religion as man's consciousness and clear conception of his relations to the All, which includes his duties to humanity, his duties to his lower fellow-creatures, and his whole conduct in every respect.

## CORRESPONDENCE.

### MATTHEW ARNOLD'S CRITICISM.

To the Editor of THE OPEN COURT:

DEAR SIR:—It is freely said that the death of Matthew Arnold was untimely because it came when the Americans were smarting under the sting of his recent criticism on their institutions, and especially on their press. Therefore in their anger they would fail to be as generous to his memory as they would have been if that criticism had not been written, or if it had been written long ago. I am not of that opinion. His death was not untimely if the shock of it serves to direct the American conscience to the criticism itself. The American editors as a class were hurt by the truth of it, and because they knew that it was true, and especially because they knew that it came from a just man and a sincere friend of the American government and the American people.

It is National wisdom to heed well the criticism that comes from other nations; to study it and learn it like a lesson. Self-glorification is very often a substitute for self-respect; and mob-orators and mob-newspapers have weakened the American character by a constant repetition of boast and bombast to the effect that everything here is better than it is elsewhere. Three hundred and sixty-five days Fourth-of-Julying in one year is tiresome, and the practice of it renders a people insensible to their own imperfections and hinders their improvement. Why improve that which is already perfect?

A warning that will last for a century or two was given to the world in 1870. For many years the French had been convinced that they were *La Grande Nation*; that they were superior to every other people in the world, and especially to the Germans. Their orators told them so; their newspapers told them so. Criticism was resisted, not heeded.

The Germans, on the other hand, were doubtful about their own perfections, and when the critics ridiculed their clumsy tactics both in peace and war, they shrewdly thought that perhaps the critics might be right. So they learned the criticisms all by heart, and tested them. They treated every criticism as a hint, and improved upon it. They never said that they were ready, but they kept on getting ready. Whether their critics were friendly or

hostile, the Germans regarded them as teachers, and studied hard. The result is known.

Germany is far ahead of her great rival, not only in the science and practice of war but in all the arts and qualities of peace.

In literature the Germans, conscious of their own deficiencies, heeded well the advice and warning of all their critics, and studied every example. Every foreign book of any value at all was translated into the German language, and made an exercise for the German intellect. Shakespeare and Milton influenced German literary development more than they influenced the literary character of England. The Germans analyzed and compared the teachings of all nations, and this practice did not weaken Germany but strengthened her until at last she produced poets of her own worthy to stand on the plane of Milton and of Shakespeare. As it was in poetry so it was in other fields of literature, in all the varied branches of art, science and philosophy.

The United States is great by reason of its natural resources. No other nation in the world has ever been so favored. The extent and fertility of its soil, the variety of its climate, the cheapness of its land, its mineral wealth, its facilities for internal commerce and manufactures, its absolute security from foreign invasion, and its free institutions promise a national development unparalleled in the history of the world; but unless the people come under moral discipline what availeth it? Their greatness will be material and coarse. If self-conceit refuse counsel and resent criticism; if the Americans think they have nothing to learn from other people, they will become a purely selfish race, morally and mentally below their material rank in the world.

It will honor us more to heed the censure of Matthew Arnold than to fretfully complain of it. Let us try to remove the reproach and not cling to it in our pride.

Yours truly,

M. T.

### MONISM AND HENISM.

To the Editor of THE OPEN COURT:

Your editorial in No. 35 entitled "Idealism, Realism and Monism," is an able explanation of a very difficult problem. Your Monism is a union of Idealism and Realism, to the exclusion of their extremes Spiritualism and Materialism, but does the name "Monism" sufficiently designate your meaning? I find that all the different systems of philosophy now claim a monistic basis; the materialists call themselves monists and even ultra-spiritualists do likewise (*Du Prel: Die monistische Seelenlehre*).

Is it advisable to use a word that does service for such different masters?

C. T. S.

[The word Monism expresses the ideal of a unitary conception of the universe. The term does service to many different masters, to materialists as well as spiritualists, because all of them acknowledge that a philosophic system must be unitary; it must agree with all facts and must be free from contradiction; one truth cannot contradict another truth.]

This seems very simple and self-evident, but it was not so to the people of the middle ages who declared e. g. that what is untenable in theology may be true in philosophy.

The unitary ideal of our philosophy is a recent acquisition and the term monism is its most exact expression. The spiritualists and the materialists reduce all phenomena to one principle, to spirit or to matter, without taking into consideration that both exist. Their unitary view has been obtained by elimination of one important factor, of reality. Accordingly their view may be free from self-contradiction—subjectively it may be a unitary view, but not objectively; it does not agree with all facts. This is *one-sidedness* but no *monism*; and I propose to call such systematized philosophic one-sidedness *henism* (see OPEN COURT No. 8, p. 210).

Time will tell whether our view is true Monism, and whether the materialist's and spiritualist's claims to a monistic conception

are tenable. We do not object to their using the term, even if their views must be classed under henism. The term monism might serve them as a guide-post which, it is to be hoped, will lead them on the right road to a truly unitary conception of the world.

We do not fight about words, but we work for ideas; however, we know that the proper usage of words is indispensable for a correct understanding of ideas. EDITOR.]

## BOOK REVIEWS.

THE NEW STATEMENT. Published by H. R. Burdick, Malder, Mass., 1888.

This little pamphlet which was recently received at our office, is an odd mixture of the simple truths of Monism, and the phantastic ideas of a spiritualistic tendency. The first chapter contains the following statements:

All that exists is *one*. There is no other. All individualities are but parts of this one all-including being.

To designate this one, that includes all, and transcends all, man has no fitter term than the name *God*.

All truth is God's truth, for all reality is in God, and all true knowledge is knowledge of God.

All that can be known of the unknown must be learned through the known.

Know thyself! and thou shalt know all thou canst know of God.

Faith assures us that what is true of a part must be in harmony with the truth of the whole, though it may not be the whole truth.

Wisdom in man can only result from a knowledge of himself and his relation to the universe, the all, or God.

The highest exercise of faith is the realization that all things are one; that all variety exists in unity, and that the greatest good is harmony, because harmony is the law of God.

All things being in, and of God, it is obvious that all are related.

Nothing exists by and for itself independent of the whole.

The end, purpose and perfection of all existence is the maintenance of a right or harmonious relation of the various parts to each other, and to the whole or God.

So far we can agree. But we must protest when the anonymous author makes "thought the only motive power in the universe," and deduces from this axiom that true knowledge creates "spiritual, mental and bodily health," and that "the final outcome of knowledge is the annihilation of death."

SUBSTANCE AND SHOW. Thomas Starr King. Edited, with an Introduction, by E. P. Whipple. Boston: Houghton, Mifflin & Co.

We have here a series of twelve discourses, lectures and sermons, delivered by one of the most eloquent speakers of modern times.

Thomas Starr King is remembered in this later day by the general public chiefly for his oratorical power and brilliancy, but the volume of essays before us shows that he deserves to be remembered as a thinker, and close reasoner as well. His editor, Mr. Whipple, says in his very interesting preface, that "Mr. King became a force in the lecture-room, as he became a force in the pulpit by the happy union in his nature of brilliancy of talent with beneficence of character." He compares him with Theodore Parker, both of whom labored "to make the lecture-room a place where both independence of opinion and peculiarity of character could be freely expressed." The first essay in the book is the famous lecture on "Substance and Show," and is a plea for the spiritual interpretation of the universe based on known scientific law. "We talk of the world of matter, but there is no such world. Everything about us is a mixture or marriage of matter

and spirit.—Organization meets us at every step—and organization implies spirit." The essay on Socrates is a valuable contribution to the many aids we have to the study of Greek literature, profoundly philosophical, at the same time that it is clear and entertaining in style. We gladly commend this volume of posthumous essays, so strangely late in its appearance before the public. There is substance for thought and reflection on every page, and the high cheer and courage, which run throughout the book, affect the reader like a spiritual tonic.

C. F. W.

HEARTSEASE AND RUE. James Russell Lowell. Boston: Houghton, Mifflin & Co.

We have learned to take up a new volume of poems by an old and loved poet, of well established fame, with a little feeling of dread, as seldom do the later works of any author equal the expectations aroused in our first delighted reading of his earlier works. But we are glad to admit a disappointment of a more pleasant order in Mr. Lowell's latest volume. As its title implies, it is a collection of verses of both a happy and sorrowful order. The volume opens with a fine poetical tribute to Agassiz, written just after the great naturalist's death. Agassiz's great-hearted, joyous nature is admirably described in the lines,

"He, that was friends with earth and all her sweet  
Took with both hands unsparringly."

Among the other long poems is a tribute to Geo. Wm. Curtis, which, we confess, we care less for. The poem, entitled "Endymion," and further described as "a mystical comment on Titian's 'Sacred and Profane Love,'" contains many beautiful lines, and is infused with a noble conception of love. Among the humorous poems we find "Credidimus Jovem Regnare," a rhymed dissertation on certain thought-problems of the day, written in a mildly satirical view, which appeared soon after the poet's return from England, and excited some unfavorable comment from the severe moralists, disposed to interpret every line in its bare literalness, to see in it only an implied censure of an age devoted to the scientific and practical. That Mr. Lowell has no great fear of the destructive effects of science upon poetry, and the ideal life, may be gathered from the sonnet, "Science and poetry," which we should like to quote entire, did space permit; but which does not divide itself easily, even for the quotation of a line.

C. F. W.

The *Art Amateur* comes punctually for May with its many notices of Spring Exhibitions and sales of paintings. Montezuma tells anecdotes of trickery in sales with a boldness in naming both dealers and victims which certainly argues courage and independence on his part. He may do real service to artists and amateurs by giving unprejudiced and reliable information on points of law and custom in picture sales—indicating the methods of honest as well as dishonest dealers. An interesting paragraph tells of the opportunities open to an intelligent bric-a-brac collector in New York. One who really knows a good thing when he sees it and dares trust his own judgment may sometimes make a bargain which pleases both sides, but an inexperienced amateur had better trust to the integrity of a well known dealer.

Greta's letter from Boston is more interesting than usual, for she gives some account, I wish it were fuller, of the designs for the new public library, which is a very important work. It is highly desirable that criticism upon it should be as much as possible preceded rather than follow its erection.

The notice of Rembrandt's Etchings at the gallery of Wunderlich & Co. is very interesting and is illustrated by fac-similes of very fine work. It is sad to think how few have time to give due study to such work, but when we consider the years and centuries during which a real masterpiece is loved and studied, though only by the few, we do not feel that the master's efforts are lost, and his influence is sifted through the few and reaches the many who

often do not know the source from which it comes. Henry Bacon's sketch of "Mending the Net" is pleasing and suggestive, although the figures and faces seem rather conventional than full of the rough freedom of fish-women's life. Elizabeth Strong's sketch of "The Poachers" makes the canine culprits very thoughtful and intent, but I very much fear if they could speak, they would say "Ha! I would do it again."

The colored plate is a very clever imitation of oil-painting and is truly named "The Laughing Man," but a more commonplace and interesting subject it would be hard to find except in the barbers' shops.

Many good hints to young artists and teachers make the number valuable, and I would specially call attention to the Amateur Photographic Exhibition to be held in Boston May, 7th to 12th.

A great deal of good work is done by Amateurs, and in their free range of subjects they preserve many effects and peculiarities which are well worthy of study.

Decorative art receives due attention; the design of fringed gentians will attract by its naturalness and the fish plate is very delicate and pretty.

"Mind" for April contains its usual variety of exceptionally able and important essays and criticisms of recent thought on diverse phases of mental science. The first essay is "On the Conditions of a True Philosophy," by Shadworth H. Hodgson; S. Bryant, D. S., treats of the Nature and Functions of a Complete Symbolic Language; Rev. H. Bushdall on "Dr. Martineau and the Theory of Vocation," and H. F. Shand on "The Unity of Consciousness." The discussions are on the "Hallucinations of Memory and 'Telepathy,'" by Prof. J. Boyce; and on "Feeling as Indifference," by J. Sully and F. H. Mason. The Critical Notices are H. Seth's "Hegelianism and Personality," by D. G. Ritchie; C. Mercier's "The Nervous System and the Mind," by T. Whitaker; J. Venn's "Logic of Chance," by W. E. Johnson; and C. Sigwart's "Vorfragen der Ethik," by Prof. W. B. Sorley. There is a very full list of notices of New Books bearing on Mental Science, English and Foreign, and Notes on Dr. Cabbett's "Elements of Physiological Psychology," by Prof. G. T. Ladd; and on Leibnitz and Hobbes by the Editor, etc., etc.

"Science" of May 4th speaks of the chair of 'experimental and comparative' psychology at the Collège de France as follows:

"The French educational world is discussing with interest a recent innovation at the Collège de France, to which we have already referred in *Science*. That institution, ranking as the representative of the higher education, and having connected with it some of France's most eminent scholars, has converted a chair at the college into a chair of 'experimental and comparative psychology.' This is a very high tribute to the new psychology, and this illustrious example will, it is hoped, induce other institutions to take a similar step. M. Paul Janet contributes an extensive article in the *Revue des Deux Mondes*, outlining the interests which the new professorship is to represent, and defending it against certain misrepresentations to which it has been laid open. The occupant of the new professorship is Th. Ribot, whose name is well known to English readers, and all of whose works have been translated and editions published in America. His three monographs—upon the 'Diseases of Memory,' the 'Diseases of the Will,' and the 'Diseases of Personality'—are most admirable introductions into the studies with which they are concerned. His work upon the psychological aspects of heredity is of standard value, and his compilations of the systems of English psychologists and of German psychologists are hardly less serviceable. M. Ribot will in his new sphere be able to still further widen his useful influence by imparting to young men the same enthusiasm and liberality of thought which he has shown in his works, and nowhere more than in his able editorship of the *Revue Philo-*

*sophique*, whose founder he is. The opening address of his course Professor Ribot (*Revue Scientifique*, April 11, 1883) devoted to a brief survey of psychological work in Europe and America. He finds everywhere encouraging examples of good work by scientific methods, and draws a very hopeful picture of the strides that this young science seems destined to make in the near future. The step that the Collège de France has thus taken is an indication of the *raison d'être* which scientific psychology has already proved for itself; and a similar form is doubtless to take place elsewhere. It is gratifying to add that the educational institutions of this country are beginning to realize the propriety of such a step, and of having a representative of the new psychology in their faculties."

## NOTES.

The greatest evil of poverty, Mr. W. M. Salter says, is that taking men as a class, it gives them no chance for the higher, moral life.

Matthew Arnold's view of the relation between "Science and Religion" may be found in his Bede Lecture at Cambridge, given under that title.

Mr. Richard A. Proctor, whose name is familiar to our readers, some time ago came near being shot by a demented person at a New York hotel.

The Concord Summer School of Philosophy, owing to the death of Mr. Alcott and the absence of Dr. Harris, will hold no session this summer.

Mrs. Humphrey Ward's "Robert Elsmere," the greatest religious novel of many years, preaches the religion of humanity. It has had the honor of a review from Mr. Gladstone.

An exchange tells of a little boy who, when asked why he had been bad during the day, answered that he wasn't sure, but he asked God to help him that morning, and he thought that perhaps God had not tried hard enough.

Dr. O. Pfeleiderer's great work on "The Philosophy of Religion" has had the good fortune to find an able English translator in Mr. Allan Menzies. The second volume, concluding the historical part, has lately appeared.

A gentleman who recently visited Herbert Spencer, tells us that he quoted Mark Twain, and that his conversational manner is light. The great dualistic philosopher has the air of one inhabiting a serene region, far above the turmoils of life.

A gentleman who was acquainted with Matthew Arnold, says that he had an almost boyish kindness and freshness of temperament, and this notwithstanding frequent terrible pain from the disease, neuralgia of the heart, that caused his sudden death.

Mr. Moncure D. Conway, who is fifty-six years old, began his religious career in a settlement of Quakers, whom he left to become first a Methodist, then a Unitarian, and finally a free-religion minister. During the war he helped his father's slaves to escape and settle in Ohio.

By the resignation of Prof. Stanley Hall, Johns Hopkins loses the leading American psychologist, just as a splendid laboratory of experimental psychology has been started, and the *American Journal of Psychology* launched on its career. To fill his place will be impossible.

Prof. Joseph Le Conte, who has long stood first in this country among writers devoted to the conciliation of religion and science, is a gray-haired, much loved professor at the University of California, where he holds the chair of geology. In the last twelve years books and essays have followed rapidly from his pen. "Evolution in its Relation to Religious Thought," just issued by Appleton's, being the latest.

Those interested in Dr. Oswald's articles should read an essay by a fellow physician in the April *Sanitarium*, on the physiological causes that produce the Tramp, the Dead-Beat and the Crank.

Emerson was a monist when he wrote: "Few understand the secret of Time (*i. e.* the succession of phenomena),—that it is the distribution of a Whole in causal series." And Shelley expressed the same thought when he sang,—"The one remains, the many change and pass."

The *Century* announces a series of articles on dreams, presentiments, astrology, somnambulism, clairvoyance and spiritualism, by Rev. J. M. Buckley, whose recent article on "Faith-Healing" in that magazine shows remarkable ability for dealing with this dubious class of subjects.

Mr. Thomas Davidson of Orange, N. J., whose contributions to this journal will be remembered, opens the second session of his School of Philosophy at Farmington, Conn., this summer. The course embraces, among others, lectures on ethics, and on modern religious thought as exhibited in Tennyson's *In Memoriam*.

Why do we remember forwards and not backwards? Because, says a recent writer in *Mind*, our thoughts usually give their attention to the future, and so acquire the habit of facing forwards; hence in recalling the events, for example, of 1860, it comes more natural to begin with January and look forwards than with December and look backwards.

Prof. L. Noiré's book "Max Müller and the Philosophy of Language" was published by Longmans, Green & Co., London, in 1879. Those interested in the study of language, and especially in the work of Max Müller will find much instructive information in this book, from which extracts have been published in No. 33 of THE OPEN COURT, p. 884.

The June "Popular Science Monthly" will have a copiously illustrated article on "WHISTLES, ANCIENT AND MODERN," by M. L. GUTHRIE, in which many forms of these ear-piercing instruments are described, ranging from the boy's whistle of willow to curious earthen specimens, the work of the ancient Peruvians, and a form in which chemicals are employed.

In his letter accepting the presidency of the new Clark University at Worcester, Mass., Prof. Hall strongly implies that nothing could have induced him to leave his work at the John Hopkins but the expectation of building up a great institution of scientific research in his new position. The funds are ample, and it may be expected that psychology will have a prominent place.

The Western Unitarian Conference is now assembled in thirty-fourth annual session at the Third Unitarian Church of this city. Upon Tuesday last a meeting of the directors was held at headquarters. Wednesday was devoted to the reading of papers and reports upon Mission Work and to the discussion of kindred subjects. The commemorative exercises: "Fifty Years of Emerson, 1838-1888," were conducted in the First M. E. Church last evening. Addresses were made by Jenkin Lloyd Jones, Frank W. Gunsaulus and William C. Gannett; appropriate selections were read, and a poem recited by John W. Chadwick. Papers will be read to-day upon "Moral Education in the Public Schools" by George P. Brown; upon the "Relation of Literature to a Child's Education" by Mary E. Burt; and upon the "Actual Roots of Religion in Human Nature.—Does Religion mean more or less as Modern Thought discards the Creeds?" by Henry Doty Maxson. The subject of to-night's discussion at the First M. E. Church will be "The Possible American Church." The opening remarks are to be made by the President of the Conference, D. L. Shorey.

The burning of the Museum of Confucius, which took place lately in a remote village of China has destroyed one of the most remarkable literary and artistic collections in the world. The edifice was the ancestral home of the family of Confucius, built cen-

turies ago near Loo in the province of Shan-Tung. In this building, generation after generation, the male heirs of the great Chinese teacher have dwelt in an unbroken line for 2,500 years, bearing the title of dukes. The tomb of Confucius is a huge mound, overgrown with trees, on the banks of the River Sze, with carved animals on each corner and groves of cypress trees ranged solemnly around. The relics of his age, and the rich tributes of worship paid to him by generation after generation, since 600 B. C., have all been gathered into this "House of Confucius," lately destroyed. Here were accumulated precious texts on stone and marble and commentaries on his books, wonderful carvings in jade and alabaster, jars and vases of porcelain. Beyond all price, to say nothing of jewels and gold and silver work sent from all parts of the celestial kingdom, and even by reverential "outer barbarians." All, or nearly all, of these treasures are forever lost by this deplorable event, which has fallen upon China as nothing short of a national calamity. No liberality on the part of emperor or people can replace the vanished memorials of that remarkable teacher. —[From *The Paper World*.]

Xenos Clark in his essay "An English Monist" says on page 899 of THE OPEN COURT: "Who among men now-a-days can say that there is a future life?" This seems to imply a denial of a future life in any form. But we do not believe that we misconstrue Mr. Xenos Clark, if we understand that he has reference to a transcendental future life in some spiritual Utopia only, as is taught by dualistic doctrines. Our author makes, as far as I know, no objection to the view of a continuance of existence after death which has been proposed in Mr. Hegeler's essays "The Basis of Ethics," No. 1, and "The Soul," No. 15. Mr. Hegeler justly considers immortality (*viz.*: the immanent immortality as taught by Monism) as the corner-stone of Ethics. He says on page 396: "We can form our soul again in the growing generation through education and example, individually and collectively. We can preserve and elevate the soul of the present generation and of posterity. To preserve and to elevate the quality of the human soul, that is the basis of ethics." The subject of the continuance of life after death has also been treated in the editorial of No. 25, Evolution and Immortality. The transcendental immortality of a ghostlike existence in a supernatural dream-land as has been taught by dualism, is untenable and impossible *per se*, while the immanent immortality of a continuance in our children, in our works and perhaps most in the influence of our ideas upon the present and following generations is an undeniable fact.

Mr. John Chappellsmith, our venerable contributor, vigorous and healthy even now in his eighty-second year has sent us his essay on "Professor Max Müller and the Science of Thought," as a contribution explaining the problems of Monism. Mr. Chappellsmith professes to be a Monist as much as we do; but there is a gap between us which, as he takes it, can not be bridged over; our difference, he thinks, is radical and fundamental. He says, in a letter to us, extracts of which were published in THE OPEN COURT No. 26: "No matter but from pre-existing matter; no life but from pre-existing life; no brute mind but from pre-existing brute mind; no human mind but from pre-existing human mind." We repeat what we stated in a foot note on page 757, that we agree with Mr. Chappellsmith when he says: "No matter but from pre-existing matter; no life but from pre-existing life." When he declares, "No human mind but from pre-existing human mind," we agree in so far as the animal mind contains the germ of the human mind. Evolution, as we have explained in our editorial of No. XXV, page 729, is not an e-volving of something which existed before in an involved state; it is a development from simpler to more complex and richer, from lower to higher forms. There is no break in the continuity of life. No gap exists between the so-called inorganic and the organic matter.

Preyer explained in an essay which, if I am not mistaken, he delivered for the first time in 1872, and which has since been repeatedly published that there cannot have taken place a *generatio equevoca*. Life can only spring from life.

Our so-called inorganic elements on the surface of the earth Preyer considers as the dross, a remnant or residuum of a life which our planet lived in its first igneous state of a blazing incandescence. The sun, Preyer declares, lives the most intense life in the solar system, and there cannot have been a break in the development of living forms from this igneous (solar) life of our planet to the development of plants and animals.

If this is true, we have to revise and correct our view of matter; for matter then can no longer be considered as a dead, inert substance. The fiery state of our planet must have possessed a vitality from which the life of the planets and animals have been developed.

Matter in so far as it possesses self-motion must be conceded to exhibit life,—a kind of life in the broadest sense of the word. Life in the sense of self-motion develops organic life in the shape of vegetable and animal forms. Animal existence exhibits all the fundamental symptoms of psychical life, and psychical life has produced in the course of a long evolution the human mind with all its wonderful achievements.

This agrees well with Huxley's view, who in an address on Biogenesis delivered in 1874 before the scientific men of Liverpool, declared: No life from dead matter.

If the evolution from the monad to man is one unbroken chain, I do not say that man did develop from the brute; man developed from the germs of the higher possibilities in the animal nature. The difference seems to be slight and a mere difference of expression. But we attach great importance to this expression, for it must be borne in mind that the kinship of man to the animal world is not humiliating for man, but elevating for the animal. Max Müller is justified in censuring those who explain the state of the primeval man through accounts of the deteriorated savage. There is a great difference between the two, the one being progressive and aspiring, the other retrogressive and degenerating.

Commencing with the last number we are publishing an essay by Carus Sterne on "The Animal Soul and the Human Soul," which in opposition to Mr. Chappellsmith exactly represents our view of the subject.

## SONNET.

BY LOUIS BELROSE, JR.

I stood at eve beside my window-sill

Watching the west; the wood and then a height,

And then the sky; where one star, cold and bright,

Sank through the leafless boughs; and all was still.

I mused of things far off, when on the hill

Beneath the star, in some lone house, a light

Was lighted, and my thoughts, from distant flight,

Came there and hovered till the dark grew still.

Our hearts are with things near, with what can be

Part of our lives or theirs who feel with us

The joy and sorrow. All the land and sea.

And sky are less than one hearth-stone, and thus,

Against the curtain of immensity,

A candle dims the light of Hesperus.

For of the soul the body form doth take  
For soul is form, and doth the body make.

—Spenser.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XI.—Continued.—CHAPTER XII.

The cloud had gathered and the heavens were darkened. The Professor once more took up the treatise of his ungracious colleague: and it was just as if a lynx had destroyed a hare or a little kid and was preparing to enjoy the feast, when a wild lion threw himself upon the booty, shaking his mane, while the other ran away with the blows of the stronger beast upon his back.

Twice Ilse called her husband to dinner in vain; when she approached his chair anxiously she saw a disturbed countenance. "I cannot eat," he said, abruptly; "send over to ask Fritz to come here directly."

Ilse, alarmed, sent to the neighboring house and seated herself in the Professor's room, following him with her eyes as he strode up and down. "What has so excited you, Felix?" she asked, anxiously.

"I beg of you, dear wife, to dine without me," he said, continuing his rapid strides.

The Doctor entered hastily. "The fragment is not from a manuscript of Tacitus," said the Professor, to his friend.

"Vivat Bachhuber!" replied he, while still at the door, waving his hat.

"There is no reason to rejoice," interrupted the Professor, gloomily; "the fragment, wherever it may have come from, contains a passage of Tacitus."

"It must have come from some place," said the Doctor.

"No," cried the Professor, loudly; "the whole is a forgery. The upper part of the text contains words put together at random and the attempts of the editor to bring them into any rational connection are not happy. The under portion of the so-called fragment has been transcribed from one of the old fathers, who has introduced a hitherto unobserved sentence of Tacitus. The forger has written certain words of this quotation under one another on the parchment strip, regularly omitting the words lying between. This cannot be doubted."

He led the Doctor, who now looked as much perplexed as himself, to his books, and showed him the correctness of his statement.

"The forger has collected his learning from the printed text of the father, for he has been clumsy enough to transcribe an error in the print made by the compositor. So there is an end of the parchment sheet and of a German scholar also."

He took out his handkerchief to dry the perspiration on his forehead and threw himself into a chair.

"Hold!" exclaimed the Doctor. "Here it is a question of a scholar of honor and repute. Let us once more examine calmly whether there may not be an accidental coincidence."

\*Translation Copyrighted.

"Try," said the Professor; "I have done with it."

The Doctor long and anxiously collated the restored text of Struvelius with the printed words of the father.

At last he said sorrowfully: "What Struvelius has restored agrees with the sense and tenor of the words of the father so remarkably that one cannot help considering the slight variation in the words of his restoration as a cunning concealment of his acquaintance with the quotation; but still it is not impossible that by good luck and acuteness a person might arrive at the true connection, as he found it."

"I do not doubt for a moment that Struvelius made his restoration honorably and in good faith," replied the Professor; "but still his position is as annoying as possible. Deceiver or deceived, the unfortunate treatise is a terrible humiliation, not only for him but for our University."

"The words of the parchment strip itself," continued the Doctor, "are undoubtedly transcribed and undoubtedly a forgery; and it is your duty to reveal the state of the case."

"The duty of my husband?" asked Ilse, rising.

"Of him who has discovered the forgery; and if Struvelius were his most intimate friend, Felix must do it."

"Mention it first to him," implored Ilse. "Do not treat him as he has treated you; if he has been in error let him repair it himself."

The Professor reflected a moment and nodding to his friend said: "She is right." He hastened to the table and wrote to Professor Struvelius, expressing a wish to speak to him immediately on an important subject. He gave the letter to Gabriel and his heart felt lighter; he was now ready to enjoy his dinner.

Ilse begged the Doctor to remain with her husband and endeavored to lead their thoughts to other subjects. She took a letter from Frau Rollmaus from her pocket, in which she begged Ilse to send her something learned to read, selected by the Professor; and Ilse expressed a wish that they might thus make some return for the part-ridges and other game that Frau Rollmaus had sent to them. This helped in some degree to cast the sanguinary thoughts of the gloomy men into the background. At last she produced a long round sausage, which Frau Rollmaus had especially destined for the Doctor, and placed it on the table. When they looked at the sausage as it lay there so peaceable and comfortable in its ample dimensions, encircled by a blue ribbon, it was impossible not to acknowledge that, in spite of false appearances and empty presumption, there was still something sterling to be found on earth. As they contemplated the good solid dish, their hearts softened, and a gentle smile betrayed their human weakness.

There was a ring at the door and Struvelius made his appearance. The Professor collected himself and

went with firm steps into his room; the Doctor went quietly away, promising to return again shortly.

"It must have been apparent to Struvelius, after a glance at his colleague, that their last conversation threatened to throw a shadow over their present meeting, for he looked frightened and his hair stood on end. The Professor laid before him the printed passage of the old monk and only added these words: "This passage has escaped you."

"It has, indeed," exclaimed Struvelius, and sat for some time poring over it. "I ought to be satisfied with this confirmation," he said at last, looking up from the folio.

But the Professor laid his finger on the book, saying:

"An extraordinary typographical error in this edition has been copied into the text of the parchment strip which you have restored—an error which is corrected at the end of the book. The words of the parchment strip are thus partly put together from this printed passage and are a forgery."

Struvelius remained mute, but he was much alarmed, and looked anxiously upon the contracted brow of his colleague.

"It will now be to your interest to give the necessary explanations concerning this forgery to the public."

"A forgery is impossible," retorted Struvelius, incautiously. "I myself removed the old glue that covered the text from the parchment."

"Yet you tell me that the strip is not in your possession. You will believe that it is no pleasure to me to enter the ranks against a colleague; therefore you yourself must without delay make the whole matter public. For it stands to reason the forgery must be made known."

Struvelius reflected.

"I take for granted that you speak with the best intentions," he began at last, "but I am firmly convinced that the parchment is genuine, and I must leave it to you to do what you consider your duty. If you choose to attack your colleague publicly, I will endeavor to bear it."

Having said this, Struvelius went away obdurate, but much disquieted, and matters took their evil course. Ilse saw with sorrow how severely her husband suffered from the obstinacy of his colleague. The Professor now wrote a short statement of the affair in the literary journal to which he contributed. He introduced the fatal passage of the monk, and forbearingly expressed his regret that the acute author of the pamphlet had in some way been imposed upon by a forgery.

This decisive condemnation created an immense sensation in the University. Like a disturbed swarm of bees, the colleagues moved about confusedly. Struvelius had but few warm friends, but he had no oppo-

nents. It is true that at first, according to all literary judgment, he was considered as done for; but he himself was not of this opinion and composed a rejoinder. In this he boasted, not without self-complacency, of the satisfactory confirmation of his restoration by the passage in the monk's writing, which he had undoubtedly overlooked; he treated the coincidence of the error in printing with that in his parchment as an extraordinary, but in no ways unheard-of accident; and finally, he did not scruple to cast some sharp, covert hints at other scholars, who considered certain authors as their own peculiar domain, and despised a small accidental discovery, though an unprejudiced judge could not hope for a greater.

This offensive allusion to the hidden manuscript cut the Professor to the quick, but he proudly disclaimed to enter into any further contest before the public. The rejoinder of Struvelius was certainly unsuccessful; but it had the effect of giving courage to those members of the University who were ill-disposed toward Felix to join the side of the opponent. The thing was, at all events, doubtful, they said, and it was contrary to good fellowship to accuse a colleague openly of such a great oversight; the assailant might have left it to others to do so. But the better portion of the leading members of the University contended from the camp of the Professor against these weak ones. Some of the most distinguished, among them all those who assembled at Ilse's tea-table, determined that the affair should not drop. In fact, the quarrel was so unfavorable to Struvelius, that it was seriously represented to him that he was bound in honor to give some kind of explanation of the parchment; but he kept silent against this array of propositions as best he could.

Even the evenings in Ilse's room assumed from this circumstance a warlike character. Their most intimate friends—the Doctor, the Mineralogist, and, not last, Raschke—sat there as a council of war, consulting against the enemy. Raschke acknowledged one evening that he had just been with the obstinate opponent and had implored of him, at least to contrive that a third person should obtain a view of the parchment. Struvelius had in some measure relented and had regretted that he had promised silence, because a prospect had been held out to him of obtaining other rare manuscripts. Then Raschke had conjured him to renounce such dubious treasures and thus to buy back freedom of speech. It must clearly have been an animated discussion, for Raschke wiped his nose and eyes with a small tea-napkin which had a fringe, and was Ilse's pride, and put it into his pocket; and when Ilse laughingly reminded him of his theft, he brought out not only the napkin, but also a silk pocket-handkerchief, which he maintained must also belong to Ilse, although it was evidently the property of some gentleman who took snuff. It

was, therefore, suspected that he had brought the handkerchief from Struvelius' room.

"Not impossible," he said, "for we were excited."

The strange pocket-handkerchief lay on a chair and was looked upon by the party present with cold and hostile feelings.

#### CHAPTER XVI.

##### THE PROFESSORS' BALL.

The Professors' ball occurred during these academical disturbances—the only festival of the year which gave to all the families of the University the opportunity of meeting in gay society. The students and other acquaintances were also invited; the ball was the important event in the city and invitations were in great demand.

An academical dance is something quite different from another ball; for besides all the good qualities of a distinguished ball, it had the three merits of German scholarship—industry, freedom and indifference: industry in dancing, even in the case of the gentlemen, freedom in agreeable intercourse between young and old, and indifference to uniforms and patent leather pumps. Undoubtedly the young people even here bore a cosmopolitan character, for the same modes of dancing, dresses, nosegays and courtesies, glancing eyes and blushing cheeks, can be found at a thousand similar festivals from the Neva to California; but any one who was more observant might perceive in the faces of many of the maidens the intellectual eyes and eloquent lips which descended to them from their learned fathers, and perhaps some small academical peculiarities in curls and ribbons. The old saying which came from a past generation of students, that professors' daughters are either pretty or homely, commended itself here also to the notice of observers, the ordinary mixture of both qualities being rare. Besides a few officers and the flower of the city youth, among the dancers here and there a young scholar might be seen, thin and pale, with smooth lank hair, more fitted to bend thoughtfully over books than to float about in the giddy dance. But what gave its value to this festival was, not the young people, but the middle-aged gentlemen and ladies. Among the elder gentlemen with grey hair and joyful countenances who stood together in groups or sauntered pleasantly among the ladies, were many important faces, with delicate features and brisk, animated and cheerful demeanor. Among the ladies there were not a few who, the rest of the year, moved noiselessly about the studies of their husbands and the nursery, who now saw themselves in unwonted gala dress displayed under the bright glare of lights, and were as shy and bashful as they had been long ago in their maiden days.

There was this time, at the beginning of the festive meeting, an evident excitement in certain individual

groups. Werner's tea-party had taken for granted that Struvelius would not come. But he was there. He stood wrapt in thought, with his usual absent look, not far from the entrance, and Ilse and her husband had to pass him. When Ilse walked through the ball-room on the Professor's arm, she saw that the eyes of many were directed curiously toward her, and a heightened color rose in her cheeks. The Professor led her up to the wife of his colleague, Günther, who had agreed with Ilse that they were to remain together that evening, and Ilse was glad when she found herself established on one of the raised seats next to the cheerful woman; and at first she only ventured to look shyly about. But the splendor of the hall, the many fine people who moved about in it, and then the first sounds of the overture, raised her spirits. She now ventured to look more about her and search out her acquaintances and, above all, her dear husband. She saw him standing not far from the door of the room, in the midst of his friends and fellow-professors, towering head and shoulders above them. She saw not far from the other door his opponent, Struvelius, standing with his little retinue, chiefly of students. Thus stood these men, in every way divided, honorably restraining the angry feelings of their bosoms. Many of her husband's acquaintances came up to Ilse; amongst others the Doctor, who teased her because she had been so afraid that they would not find each other in the confusion of strange people. The Mineralogist also came and declared his intention of asking her to dance. But Ilse, earnestly entreating him, said:

"I beg of you not to do it. I am not perfect in these new city dances and you would not get on well with me; I had rather not dance. Besides, it is not necessary, for I am in a very gay mood and it amuses me to look at all the fine people."

Soon various strangers approached and were introduced to her, and she acquired greater ease in refusing to dance.

(To be continued.)

## Contents of Recent Numbers.

### THE ETHICAL BASIS OF CHARITY.

W. ALEXANDER JOHNSON.

The Editor of *The Reporter*, an organ of Organized Charity, Chicago, speaks not only from experience but takes the scientific aspect of this most vital problem. The basis of Charity must not be sought for in the sustenance of a pauper class who would not exist but for charity. The basis of Charity must be sought for in ourselves and our ethical nature. To this truth the principles and methods of doing the work of Charity must conform.

### THE INTERNATIONAL COUNCIL OF WOMEN.

MONSIEUR D. CONWAY.

A timely word about a remarkable and encouraging progress in the development of human kind.

### DETERMINISM VERSUS INDETERMINISM.

PROF. GEORG VON GIZYCKI. In Nos. 25 and 26.

George Von Gizycki is Professor of Philosophy at the University of Berlin. His name is well known beyond the boundary of his country. The problem of the Freedom of the Will has perhaps never been treated in a clearer and more forcible manner. Contributions on the same subject may be expected from E. P. Powell and Xenos Clark.

### REFLEX MOTIONS.

G. H. SCHNEIDER. In No. 21.

G. H. Schneider's book, *Der Menschliche Wille*, is one of the most prominent delineations of modern psychological research. The essay on Reflex Motions is a translation of the basic chapter of Schneider's work. It contains the fundamental propositions of physiological psychology.

### THE EDUCATION OF PARENTS BY THEIR CHILDREN. THE ANIMAL SOUL AND THE HUMAN SOUL.

CARUS STERN. In Nos. 22, 23 and 37.

Essays full of fine thought and psychological depth.

### THE QUESTION OF IMMORTALITY

Is treated in the Editorial of No. 25, "Evolution and Immortality." It is shown that Immortality according to the Monistic view is immanent; it is a continuance of ourselves in our children, in our ideas and in the work we have done during life. Rudolf Weyler in his essay "The Process of Progress" in No. 24, speaks of death as a mere transition and C. Billups in a letter of No. 25 criticizes the wrong notion of a transcendent immortality as taught by Dualism.

### EVOLUTION AND IDEALISM.

PROF. E. D. COPE. In No. 23.

A very able statement of Positivism and scientific inquiry versus the imagination of a wrong Idealism. Prof. Cope treats this subject with perspicuity and strength. His essay should be compared with the Editorial of No. 35 "Idealism, Realism and Monism."

### \* TRUSTS AND UNIONS

#### IS THE BANKING SYSTEM A MONOPOLY?

LYMAN J. GAGE. In No. 38 and 39.

These two essays contain the subject-matter of the author's lecture in the Economic Conferences. Mr. Gage is one of the most prominent bankers in the financial world. His view of the banking system in reference to the social problem deserves the attention of all parties. An answer to his propositions from the standpoint of a laborer will be given by Wheelbarrow in No. 40.

## THE OPEN COURT,

PUBLISHED EVERY THURSDAY BY

### THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, President.

DR. PAUL CARUS, Editor.

THE OPEN COURT is devoted to the work of conciliating Religion with Science. The founder and editor have found this conciliation in Monism—to present and defend which is the main object of THE OPEN COURT.

THE OPEN COURT has for contributors the leading thinkers of the old and new world.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social and economic questions.

TERMS, \$2.00 PER YEAR. \$1.00 FOR SIX MONTHS. \$0.50 FOR THREE MONTHS. SINGLE COPIES, 10 CTS.

## FREE-WILL A MECHANICAL POSSIBILITY.

BY XENOS CLARK.

There are certain scientific analogies which tend strongly to confirm the Editor's view of Determinism and Free-will stated in No. 33 of THE OPEN COURT, and which for that reason will perhaps interest readers of this journal. While most of the analogies referred to are, I think, my own, I owe the suggestion that initiated this line of thought to so able an authority as Prof. Sylvester, the great English mathematician who by his late residence in this country gave such spur to American mathematical work. Prof. Sylvester's contribution to the subject, and the writer's degree of indebtedness to it, will be mentioned further on.

As the reader will remember, Dr. Carus says that monism settles the old free-will dispute between religion and science by admitting the truth of *both* free-will and determinism. Now, this at first seems paradoxical; but let us look a little farther. As everyone sees at once, the whole question is a practical one; the moralist's insistence on free-will is not due to affection for the theory, but to respect for the fact, for the immense practical importance of free-will in men's struggle for the good. Determinism is ordinarily deemed fatal to this struggle, because the man whose soul is wavering, if told that all he does is predetermined by law, considers in the first place that the responsibility is thus removed from him, and in the second place that, the result being predetermined, it is hopeless to fight against it. Too often he has fought and failed, and this seems to explain *why* he has failed; determinism only too aptly confirms his frequent experience.

To state the difficulty in another way, a great book can be imagined containing all the facts of the future, accurately predicted by science, and among them the acts of every man. Science has not yet produced such a book, but a universe ruled by determinism goes on as if it had, and we can reason on that basis. In this suppositious book, then, every man's life is written from beginning to end. And since it is there written, how can he change it? What chance has his free-will to operate? Yet moralists claim that tho' there be every reason, so far as science and determinism go, to predict a man's certain failure, nay, let the record already be placed in the great book, still he may thwart it if he sufficiently exert his free-will.

To escape from this hard dilemma, it seems necessary to discover some variety of determinism which, while fulfilling the requirements of science, does not permit the prediction of the future in *all its details*; and to this task the present inquiry now turns. For a first attempt, the reader may imagine a lever balanced by equal weights on either side of the fulcrum, which is at the center; he will at once perceive that if these weights are moved equal distances towards or from the fulcrum, the lever will still remain balanced. He may next imagine a series of such levers connected end to end, in a line. Then he can readily see that this series of levers will deliver at one end, unaltered, whatever force may be applied at the other, no matter how the intermediate weights are shifted, if shifted as just prescribed. Here is a crude sort of illustration of what is desired. The series of levers stands for a deterministic universe in which force expended and force received always balance, and the weights that can be shifted without altering the determinism, represent the action of free-will in such a universe.

But to attempt something more accurate than this. According to modern science, the mechanical cosmos in its ultimate analysis consists solely of innumerable molecules flying through space, and the force of this flight, in the case of each molecule, equals the product of its mass by its velocity. Take the sum of all these products at any given moment, and the total amount of force in the universe is known—a total which the law of conservation of energy says can never change. The molecules, it is true, may collide, may shift, may change, but whatever velocity one gives up another takes, and the result does not alter. But now suppose that some agent, which may be called free-will, has the power, in reference to a couple of molecules, of increasing the velocity of one and diminishing that of the other, provided the increase and decrease just balance. After such an interchange the total universe-force would remain unaltered, and yet free-will would have had its say. To narrow the illustration down to the human body, each body receives a measured amount of force from the environment, which exact amount is given forth again; but while the *amount* is the same, who can say that in its passage through the body the *distribution* of the force has not suffered alteration? It is true the molecular

physicist will probably laugh when a redistribution of force without alteration of amount is talked about, and will ask where in nature a single instance of such an occurrence can be cited; but the advocate of free-will can very pertinently remind him that the simpler processes of nature do not rightly furnish a criterion as to the molecular mechanism of the brain, an organ of which we as yet know so little, and in the study of which the most important revelations may be expected, since in the brain alone of all physical bodies that mystery, consciousness, appears. It may not be wrong, then, to assume that while the human brain satisfies the great law of determinism by giving forth just as much molecular force as it receives, the distribution of this force, in its passage through the brain, suffers alteration at the hands of free-will.

It must be freely admitted that all the above is hypothesis, and cannot be accorded even scientific probability. Its sole use is to confute the ultra-determinist, who needs to be reminded occasionally that to a mere 'perhaps,' in argument, a mere 'perhaps-not' is sufficient answer. The ultra-determinist insists that science and religion are irreconcilable on the point in dispute,—insists that a deterministic universe cannot exist in which there is a place for free-will. "A mere guess," we answer, "and in rebuttal we offer *our* guess, which we think is quite as good as yours, and possibly even better."

In addition to the analogies from physical science which have been offered, interesting confirmation of the position taken in this article may be drawn from mathematics. The student of algebra, for instance, will at once recall those equations which are true for either of two (and sometimes more) values of  $x$ ; and it will readily occur to him that if such an equation represent a mechanical process—say the reaction of a brain-cell in the act of willing—then there will be two alternative solutions for the equation, either of which is equally consistent with the mechanical laws involved. And what is called choice or free-will on the mental side, may, on the physical side, consist in the alternative offered by these two solutions, either of which satisfies determinism.

Ever since the discovery by Col. Peaucellier of his remarkable link-work for converting circular into rectilinear motion, the question of linkages has been a fascinating one to mathematicians, and invention has followed invention rapidly. Fortunately the subject is not a difficult one, and the general reader may find an easy popular presentation in Mr. A. B. Kempe's "How to Draw a Straight Line" (*Nature Series*). In their ordinary uses, linkages are little geometrical figures made of rods pivoted together at their ends, which describe difficult curves, solve equations, perform arithmetical processes, and attain all manner of

complicated results by simple means. In theoretical development Prof. Sylvester has carried the subject so far, that he even talks of the universe as a great linkage. "It is quite conceivable," he says, "that the whole universe may constitute one great linkage, *i. e.* a system of points bound to maintain invariable distances, certain of them from certain others, and that the law of gravitation and similar physical rules for reading off natural phenomena may be the consequence of this condition of things. If the Cosmic linkage is of the kind I have called complete, then determinism is the law of Nature; but if there be more than one degree of liberty in the system there will be room reserved for the play of free-will." (*Nature*, XII; p. 214.)

Unfortunately, without the use of wood-cuts, it is not possible to make evident the distinction Prof. Sylvester draws between what he names complete linkages and linkages with more than one degree of freedom; were it possible however, I could easily show that we are not compelled to find in the great mathematician's language any implication adverse to a Cosmic linkage admitting *both* free-will and determinism. Though Prof. Sylvester does not follow out this branch of the thought, it is a fact that those linkages possessing more than one degree of freedom which he mentions as possible instruments of free-will, do also possess their share of determinism. I have recently constructed a linkage for the transference of angles from one point to another, in such a manner that by varying an angle in one part of the link-work, I can reproduce equal angle-variations in another, distant part. But the apparatus is also so arranged that a second person, *A*, taking hold of the linkage, can at the same time but independently of me vary the orientation of that distant angle, making it face north or south or east or west, as he desires. Here, I control the size of the angle, *A* the orientation, or, in the terms of our analogy, I as determinism regulate the angle's dimension, and can always predict that with exactness, while *A* as free-will decides how the angle shall face. Build a universe of such linkages (it is so easy to build universes when one has had a little training!) and it will satisfy the demands of both free-will and determinism.

Even Prof. Sylvester's complete linkages, I may add, are not absolutely safe from free-will. As mathematicians will recall, and this observation is solely for their notice, there are certain positions of a complete linkage which present that mechanical ambiguity known as a dead-center, positions in which the linkage is at liberty to move in either of two directions while still fulfilling the laws of its determinism, and which accordingly an outside agent may take advantage of as it may elect. In a linkage-brain, if one can imagine

such, free-will will wait until the dead-centers come round and will then give the deciding thrust in the desired direction.

#### THE LAST DITCH OF DUALISM.

BY E. P. POWELL.

From the controversy between Dr. James and Prof. Von Gizycki it is clear that Dualism, having, as Prof. Diman and the theists of the last generation averred was their duty, pushed the "First Cause as far back as possible," now deliberately proceeds to rob him of a part of his Causality. Martineau who is by far the ablest representative of the Theistic School, does not hesitate in his recent work, "Study of Religion," to say that if we cannot harmonize free-will with Divine foreknowledge, then we must clip the latter. Prof. James does not hesitate to follow in the same path. Indeterminism does not claim all of causality. "It only asks to exist somewhere in the world; and this claim is incompatible with the existence of an Absolute One and All." I am aware that his phrase for God is in this case a borrowed term; nevertheless, there is left under any terminology the general fact that Dualism, not content with setting the cause of causes in the remotest retreat *behind* law, is now determined that he shall be shorn of a part of his causal efficiency. "The result must be a concession on the part of the universal claimer." But let us first get an authorized definition of Christian Dualism. Says Cardinal Newman, "I mean by the Supreme Being one who is simply self-dependent, and the only being who is such. I mean that He created all things out of nothing; and could destroy them as easily as he made them; and that in consequence He is separated from them by an abyss, and is incommunicable in all his attributes." This is authorized Dualism, absolute and undisturbed. Here you have the longed for worshipable factor; and the worshipping factor. Now I insist that for the worshipping factor to crowd in the case, and under the circumstances, is impertinent; especially to ask concessions of the Maker.

But if Dualism will tamper with Science it loses its equipoise; its nice balance of God and Nature, and the Nature end begins to come down, and the God end to go up. The only possible course is to refuse to listen to natural facts altogether, and stand by revelation. This our dualists have not done. They let in the idea of law, not mistrusting that it would go farther than the Mosaic Days. But having set Law, in long Eons, at work at creation, it soon became clear that there was no getting rid of Law. The Creator having made, or been compelled to make, one concession, was driven to concede more and more. Prof. Diman, whom I quoted in my previous article, says we believe that God is "the Supreme, existing alone, and

apart from the world"; but adds "a little consideration must convince any candid mind that evolution pushes the First Cause back;" and adds "it is our duty to push him as far back as possible." Beginning with "One Half" as worshipable, where are our dualists ending? Shall we say they have now a One Quarter? or a One Eighth? or a One Tenth?

But now comes the final difficulty. Having established a Cause of Causes, who is not the Cause of all Causes, but only the Cause of those Causes which are permissible in connection with human causative energy, there is a demand that He shall yet retain the worship of mankind as much as if he were in no way limited or hedged. He must remain a terminus of thought. It is clear on the other hand, so these indeterminists insist, that any view that is monistic, making Nature to be causal,—inclusive of all causative force,—so that we find in Nature the Moral and intellectual causation, as well as the physical, and therefore speak sometimes of Nature as The All in All, (see Bible,) or simply as the All;—any such view, they insist, is inconsistent with worship.

Now I cannot worship a power that is "pushed back" (see Diman), and made to grant concessions (see James), and to work supplements (see Bishop Foster); a Being that is extra-natural, and autocratic; and yet subject to democratic manipulation of authority; but I see no hindrance whatever, Dr. James to the contrary, to honoring that universal potency and purpose that has, according to Evolution, worked on our small globe; from monad to man;—on the line of ethical purpose and moral achievement. I can easily understand what the Nature lover means, who finds, beside the admirable but cold beauty of forms, the throbbing presence of Life and Love. Prof. James, in this case, has followed his mistake of smart writing;—and asks if we cannot as well worship the Half as the All. One would think that the Doctor had been writing Atlantic Book-Notices; and accustomed himself to taking us off at a quaff; one gulp, and that were the end of monism. Dualism having nothing to begin with but the half, ends with an unknowable quantity and decreasing power, and is slowly but certainly landing in Atheism.

Monism has no occasion to answer the sneer as to the Noun of Multitude, otherwise than to ask how large a part of the Infinite God of Dualism does the average worshiper succeed in worshipping? What section of the extra-natural, but badly pushed God does the howling salvationist worship? What particle of him does the Calvinist glorify when he reads Edward's sermons with a smacking relish, and indulges in dogmatic prayers concerning Hell and the Elect? I do not ask these questions by way of sneer, but as re-tort equivalent; leaving the Arithmetic of Religion at

least where it belongs. Now the monist, first of all, has to do with truth, and not with worship. The question at the outset is purely one of facts; and whatever view of the universe most conforms to facts, must be held to be, if not the correct one, at least the correct one for us to hold for the present.

I showed in a previous article, in reply to Theophilus, that religion has never been other than science, plus worship or emotion. And the question now is, does latest science fail to give us any basis for emotion? Has it at last come about that science can only give us a mental concept and no consequent feeling? This, indeed, would be strange. But I imagine this trouble of Dr. James is precisely the trouble that agitated the fellows who put the thumb-screw on Galileo. The Heliocentric Concept was so enormous that it swelled out the petty Deity of early Christianity to very extravagant proportions. It was the All that troubled them—they could not any longer worship.

Now the trouble with Monism is an enlargement of the moral universe to exactly fit to and match the physical; and it disturbs the flow of emotion! Why not take a Half to be sure? But if a half,—which is preferable, one-half of the Being, apart from Nature, who has been pushed, and pushed, and who has conceded a part of his causative power to Dr. James, and to you, and to me; and been compelled to subdivide it among millions more of indeterminists? Or one-half of the Eternal One who needs to yield nothing to oblige our Professors or us?

Quoting from "Our Heredity from God": "If then your cause of causes, alien to the world and to Nature, cannot be positively found anywhere, or located, of what value can He be, even as a relief to interrogation? The stern demand of reason for an adequate cause is answered by an adjustable potency, who is even compelled to hitch together his divine purposes with Supplementary Providences, while at each push of investigation he retreats into the deeper recesses of limbo. This is simply to accept of an unfindable in the place of Spencer's 'Unknownable'. Back, and still farther back, the Dualist has retired, hugging his Creator;—Science still pursuing and illumining his deeper recesses. Let us rather stand here: that God is not apart from Nature; that the magnificent reign of life and law that is unfolding year by year, and age by age, is but the pulsating presence of Him who is over all, through all, interpenetrating all. Then can we at last rest."

When I first took pen in hand, I purposed a reply to other points in Prof. James's letter; but the reasonable limitations of an article in THE OPEN COURT compel me to confine myself to one; yet with the kind permission of the Editor, I hope again to recur to the learned and genial Doctor in a future article.

## IS THE BANKING SYSTEM A MONOPOLY?

BY LYMAN J. GAGE.

In giving a brief description of the organization and operations of a bank, I shall confine myself to National banks alone. This for two reasons. First, because whatever may be said of them may be applied in a general way to all banks; and,

Second, because National banks have been held forth especially by portions of the public press and by platform orators as injurious monopolies. The many adjectives used in so describing them I will not repeat.

If any bank is an injurious monopoly, then National banks are so; and if they deserve such a characterization, they ought to be wound up and forbidden to prosecute their injurious vocation. Do they deserve it? Let us see. A National bank may be organized by any number of citizens, not less than five, in any place in the United States. There are certain restrictions as to capital. Thus, no bank can be organized with less than fifty thousand dollars in capital, and in certain cities they must have more, reference being in general had to the population of the village or city where such organization is proposed. The number of these organizations is nowhere limited or restricted—fifty or five hundred, so far as legal restriction is concerned, may be organized in Chicago within the next year—and the laws controlling their action are made, and may at any time be amended by the representatives of the people in Congress assembled. The officers, directors and shareholders are held to a strict accountability; and the number of bank officers now in prison, or in Canada, (by many regarded as another name for the same place,) is good evidence that the laws are enforced.

A monopoly is described in the dictionary as the sole power to vend goods; a power either coming as a free grant from a government or secured by purchase. How can this word, so defined, be applied to banks? But possibly, though not justly chargeable with monopoly, in a legal sense, they may exercise such powers as to practically bring them within the fair meaning of that word, giving it a little broader definition. What are in their powers, and what are their practices?

First, as to their powers: They may deposit with the government of the United States bonds to the amount of their capital, and issue their own notes to circulate as money to the amount of ninety per cent. of the bonds so deposited. For this privilege they pay a tax into the National treasury of one per cent. per annum on the average of their notes outstanding. The small value of this privilege may be inferred from the fact that Chicago banks with a right to issue over fourteen millions of dollars in such notes have outstanding less than one million dollars. The National banks of the country, as a whole, with a right to issue about five

hundred millions of such notes have outstanding only about one hundred and sixty-six millions.

Second: They have power to receive deposits of money, but no power to compel any man to deposit a penny.

Third: They have the power to lend money, but are forbidden by the law to loan any one person, firm or corporation, at any one period, more than ten per cent. of their capital. They are likewise forbidden to charge or receive a greater rate of interest than the law of the State allows its own citizens to charge or receive where the bank is located.

Fourth: They have power to sue and be sued in the courts the same as an individual.

Fifth: They may buy and sell exchange on other cities.

Sixth: They may hold real estate, for office purposes, or such as they may take in the settlement of debts previously contracted, but such real estate, so received in the settlement of debts, must not be carried longer than five years.

This, in instance, embraces all their powers and privileges. It is evident from the enumeration that they can do no business unless the people in the community in which the bank is located desire it. Like a hotel or a boarding house, they may build and furnish and open their doors, but they cannot compel any one to come in. With no power of compulsion, subject to full and energetic competition, what kind of an imagination is it that finds in them anything which partakes in any way of the character of a monopoly? And why should they be called by the opprobrious name of monopolist?

We have glanced at the laws under which National banks are created and the general powers conferred upon them. Let us now look at their practical operation, and see if we can discern in their practices anything injurious to the general good. As before stated, they cannot compel patronage from any one, and so far as they do have relations with the people, it must be by the voluntary wish of the people themselves. There are over three thousand National banks in the United States, one or more being found in every village of considerable size throughout the land.

As a whole, their capital aggregates five hundred and seventy-eight millions. This is a large amount, but they owe to the people, who voluntarily place their money on deposit with these banks, one thousand two hundred and forty millions. The depositors as a whole could buy the banks as a whole twice over, and have money left. What advantages do these depositors derive?

In many cases, they receive a small interest on their monies, which would otherwise be idle and unproductive. In all cases, they transfer their funds

from their own custody to a place of greater average security. By the check system in vogue, they are at all times able to transfer their money, in sums to suit, by orders on the bank, instead of by an actual transfer of the money itself. The keeping of a bank account also brings the depositor into acquaintance with his banker, and gives him superior claims upon the banker's regard, should he require to borrow for the temporary needs of his business or other purposes.

The amount loaned by National banks to their dealers, and to the public, as shown by the statements published in October last, was one thousand five hundred and eighty-seven millions. The value of these temporary loans to merchants, manufacturers, agriculturists, and, indeed, to the whole community cannot be estimated. The employees of many manufacturers, who each week with perfect regularity, receive their weekly pay, little know how often they would go home with an anxious mind and an empty pocket had not the employer found his banker ready and willing to make necessary advances to make up the weekly pay-roll.

A bank has been, not unaptly, compared to a reservoir, into which flow the temporarily unused funds of the community. Out from it, if judiciously conducted, a portion is sent in productive streams, to enrich the channels of trade and industry.

There are two ways in which the operatives at Glasgow might obtain American flour. They might put their money together, entrust it to a capable agent, and send him with it across the Atlantic, and thence across the country which separates the Atlantic from the mills at Minneapolis or Chicago, and there lay down their money, obtain their flour, and transport it to their homes in Glasgow by such means as they could command.

In the days of the patriarchs this would have been their method. So Jacob did when he sent his sons into Egypt to buy corn; but thanks to the developments of commerce, and the creation of intermediate agencies, a more convenient, economical, and a safer method now prevails. When the operative at Glasgow wants flour, he simply goes to his grocer, secures the needed quantity, and has the value of it entered to his debit on a week or a month's credit. His grocer, in his turn, gets flour from the jobber or wholesale dealer, on a credit of thirty or sixty days. But the latter does not send his money across the Atlantic. Instead of this, he sends a mail or telegraphic order to his broker in Chicago or Minneapolis, indicating the amount of flour he desires. The broker buys the commodity of the miller, who delivers the flour of the transportation company, and receives what is called a negotiable bill of lading. This instrument is merely a contract that, for a certain consideration, the company will transport the flour to Glasgow, and there deliver it to whoever

may be the legal holder of the bill of lading. This instrument the miller delivers to the broker, and receives payment for his flour in the form of a check upon the bank, where, quite possibly, the broker has no money to his credit. To cover his check, so drawn, the broker hurries to the bank, draws his draft, generally at sixty days' sight, upon the jobber in Glasgow, for the value of the flour, with the addition of his small charges. To the draft he attaches the bill of lading, and thus secured in the control of the property, the banker puts to the credit of the broker the equivalent of the draft, and thus is provided a fund for the payment of the broker's check.

The transaction is now so far advanced, that the flour is safely on its way to the consumer in Glasgow, and at this point the banker would seem to be the only one who is out of pocket as to money. If the matter went along to its natural conclusion, the flour would reach its destination, the draft drawn against it be duly paid to the banker in Glasgow or London for the credit and use of the American banker.

How then, will the American banker recover back the fund which it is thus seen he has transferred from his own strong box to the keeping of the English bank? By a very simple method, as you will see.

While this operation, the purchase and shipment of the flour, has been going on, another, but quite similar operation has occurred from the other side. The American millers have been receiving burlaps and bags from manufacturers in Scotland. Desiring to pay for these, they apply to the American banker, who, for the cash, will give them his draft or order against the funds to his credit in the English or Scotch bank, resulting from the draft or bill collected against the flour; and so the American banker has his fund in hand again. The flour is settled for, the burlaps are paid for, and all are satisfied. No money has passed between the two countries.

The operation described is, in effect, an indirect exchange of commodities—flour for burlaps. The intervention of the banker and the use of bills of exchange alone make this possible. This illustration fairly shows how the great traffic between nations is carried on. With imports to the value of seven hundred millions or more, and exports to a similar amount, not more than five to eight per cent. of the whole is settled for by direct shipments of money. The great bulk is settled in the way we have described in the example of the flour and the burlaps.

Surely this is a great service. It is, in substance, as if the banker stood midway between the two countries passing in with one hand the products of foreign skill, and passing out with the other hand, in fair exchange, the products of American industry. For this service, his charge for profit, competition has reduced

to an insignificant sum. His charge for profit applied to a barrel of flour, would be about one and one quarter cents per barrel.

Let me give you one or two instances taken from real transactions, which will illustrate better than argument can some of the offices and functions of a bank, and the celerity of modern methods as well.

Some time ago a banker was notified that he was wanted at the telephone. With the 'phone to his ear he recognized the voice of a dealer four miles distant, who said: "It is very important that I pay to-day to Messrs. Blank, Number Blank, Union Building, London, fifty-eight hundred pounds sterling. Can it be done?" The banker's reply was, "Yes, if the cable is working; I will attend to it at once. Send in your check before close of bank." Within two hours the payment was made in London. Not long since, a Chicago dealer appeared in the bank with a cablegram in his hand. It came from a correspondent in Smyrna, Asia. It brought information that owing to fear of a war blockade a consignment of certain goods was offered for immediate cash at a very low price. By the bank's facilities the matter was arranged, and within twelve hours the cargo was paid for, duly loaded, and on its way to America. Curiously enough it was a cargo of canary seed.

But if the bank or the banker is so important in our foreign trade, he is immensely more so in our home affairs, where the volume of industrial exchanges is many times greater. The mind can hardly take in and comprehend the great office served by bank checks in the purchase and sale of industrial products in the United States. The daily reports of the clearing houses of the principal cities show that daily transactions covered by checks drawn upon banks aggregate about one hundred and sixty millions of dollars per day. The total supply of money in the country is less than sixteen hundred millions, including gold, greenbacks, national bank notes, silver and silver certificates. If commercial transactions were carried by the use of money alone, an amount very much larger than our total present supply would be constantly in transit at enormous expense and great risk or, the stock of money remaining the same, the price of commodities and labor would shrink to a degree that no man can estimate, in order to be exchanged against direct cash payments. At least eighty-five per cent. of all commercial payments are now made with checks and drafts.

In the course of the exchanges hinted at rather than fully described, it is the function of the banker to make payment for industrial products at the point of production or at the point where they are first offered for sale, in ready cash, and to get his re-imbursement from the final market or point of consumption. To illustrate: The value of live animals annually mar-

keted at the Union Stock Yards in Chicago is not far from two hundred millions. All are paid for by check on the bank as fast as weighed. The larger part, as you know, go forward to other markets, either immediately or after being converted into cured meats. In the final markets throughout the East, the banker realizes the fund he has here advanced. The same method is in vogue regarding all agricultural products here marketed.

This service of the banker is surely a great advantage to the western farmer, unless too dearly secured. What is the banker's charge for making these cash payments here and taking his re-imbursement three days later in New York, Baltimore, Boston or Philadelphia? About fifty cents on each one thousand dollars is the average charge.

I might speak of the honorable character, of an office and duty so high and important as we have seen rest upon the banker. I might also show in many other ways the benefit he confers upon the community, a benefit not conferred upon the rich and prosperous class alone, but shared in by the humblest member of our industrial society. If the suggestions I have made go to show that he fills a necessary and useful place in the social economical system my object is attained.

I should not like to attempt to prove that he is, by the nature of his calling, a disinterested philanthropist. "Favor and benevolence are not the attributes of sound banking; the rigid performance of contracts is its sure foundation."

The banker is the natural result of the unfolding and development of the modern social state. In this unfolding the division of labor has been a marked feature, and in this process of division, the banker, the broker, and the insurance office, have been indispensable factors. To try to eliminate them would be a folly as great as to dis sever from the human body any of its useful members.

#### RELIGION AND MORALS.

Professor Georg von Gizycki declares in his letter, published on page 682 of *THE OPEN COURT*, that Theology and Metaphysics have nothing to do with Morality. This is true only in so far as men who embrace or reject certain theological and metaphysical views may or may not act morally. The side issues of theology and metaphysics, which by theologians and metaphysical thinkers are generally considered as the most important of things, have as a rule little or no bearing whatever on morality. In so far, however, as Theology and Metaphysics discuss vital religious and philosophical problems, they *have* a certain relation to morality.

Morality depends on a sound conception of ourselves in relation to the world and, therefore, philosophical

and religious errors will have an injurious effect upon morality.

If we allow ourselves to be carried away by impulse, we are not moral. Animals are un-moral. Their brutish conduct is not immoral; it is natural in them, as it becomes their brutish nature; and their good conduct (self-sacrifice of mothers for their young, etc.), although we justly praise it, can not be properly considered as moral, because it is the result of instinct done from impulse and not an act of conscious deliberation. Man is moral in so far as he consciously and deliberately regulates his actions according to his relations to the All. Religion supplies him with the reason *why* the principles of his actions should be such as they are, and *why* he should do what he considers to be right and proper to do.

Religion, if understood to be our recognition of the Unity in Nature, teaches us to consider ourselves as parts of the whole; and who can doubt its strong influence upon all our conduct? The laws of the Universe govern also the motions of our body. Heat and gravitation operate as much in the functions of our organs as in the solar systems of the universe. Our lives depend upon surrounding nature, upon the atmosphere we breathe, the soil upon which we stand and the food which mother earth produces for us. Our existence is a continuous exchange and inter-communication with the whole "in which we live and move and have our being." The very pressure of the air upon our limbs is part of our life, which, if taken away, would cause instant dissolution.

But we are not only physical parts of Nature, we belong also to a higher order of natural growth which discloses ethical ideas and moral duties. The threads of our life are connected with the lives of other beings like ourselves, of beings whose origin is the same as ours and with whom we form one great family. These relations, although woven of invisible threads, are of no less importance than the coarser relations of our body to physical Nature. These relations of social and family life, if recognized, will teach us duties, and the performance of these duties is morality.

Religion, Science, Philosophy, Ethics and Morals accordingly are closely related to each other; religion is the recognition of the Unity in Nature which makes us feel that we are parts of it; Science is the study of the several departments of nature by observation and classification of its phenomena; philosophy is the result of the sciences, systematized. Ethics is the science of morals, and Morality is our behavior regulated by religion, viz., by the recognition of the Unity of Nature in all its phases, the lower physical, the physiological and above all the social relations between man and man.

Those who are moral, prove that they *have* re-

ligion, viz., religion as defined by THE OPEN COURT; for the moral man regulates his actions in accordance with his duties as implied by his relations to the All, especially to his fellow-beings. It is of great consequence to *have* religion in this sense, but it is of little consequence to *confess* a religion. *Religion* has to do with morals and morality, but all the different *religions* have little or no connection with morality, and if they have, it is only in so far as they confess *religion*.

False religions and wrong philosophies have always had detrimental effects upon their adherents. The quietism of India has nipped in the bud a grand and rich civilization, and the dualism of the middle ages has dragged many thousand victims to a shameful death for the alleged crime of witchcraft. The evil consequences of fundamental errors in philosophy and in religion bear witness to the dependence of morality on philosophy and religion. If you poison the religious or philosophical views of a man or of a nation, you will poison their morality also. The roots of man's intellectual life (viz., of that in man which makes of him a human being) are his convictions and his emotional inclinations (i. e., his philosophy and his religion), while his actions are the fruits thereof, by which we may recognize their soundness and vitality. P. C.

## CORRESPONDENCE.

### THEOLOGY AND MORALITY.

BERLIN, April 9, 1888.

DR. PAUL CARUS. *Dear Sir:*—The copy of Prof. James's reply to my article, which you were so kind as to forward me, I received to-day. Accept my thanks for the same. I have read it with pleasure. Those who believe that an answer to Prof. James's remarks is not contained in the article itself, I could satisfy only by an elaborate treatment of the subject, wherein I would have to prove in particular that morals are totally independent of Theology and Metaphysics. This, however, would require more space than THE OPEN COURT would wish to devote to the question. I am at present occupied with the preparation of a work entitled "*Moral-Philosophie*," in which I thoroughly discuss the point just mentioned as well as the Free-Will Controversy, and I shall beg leave to send you and Prof. James during the present year—as I hope—a copy of my work in lieu of an answer to his letter. With this, I willingly grant Prof. James the last word in the matter.

If you deem it proper, you may publish what I have written.

Respectfully,

GEORG VON GIŻYCKI.

### EVIL SPIRITS AND PUNISHMENT OF SIN.

To the Editor of THE OPEN COURT:

SIR:—I beg to thank you for printing my letter of April 10th, thus illustrating that you admit communications which echo sentiments different from your own.

As I expected, you think my views of "Creators of discord" anthropomorphic. And why should we not express such thoughts anthropomorphically? It is in accord with the method of the first ages. I shall be glad if you will also print this letter, for I am a seeker after truth, and have been from my boyhood, when I read Theodore Parker, Emerson, and the then aggressive univers-

alists. I really tried to reject, if the truth permitted, the idea of future suffering for wrong-doing in life present. First, I affirm there is no *a priori* reason against it; second, it accords with the facts of primitive history; third, neither science nor the *ipse dixit* of any modern can set aside those facts, which are found on the monuments and parchments of Egypt, in the inscriptions of Assyria, in the records of Accadian and Semitic Babylonians, as well as in the Hebrew Scriptures. My point is not their inspiration, but their contents. To those records I appeal in proof of my position. For ready reference and use of your many readers let me refer to a little book on "God in Creation," published by Mr. Whittaker, No. 2 Bible House, N. Y., for half a dollar, which has a chapter on "Satan and Evil Spirits," citing ancient legends from the above mentioned peoples and giving their account of why they were expelled from heaven and came to our earth. The facts as recorded are as vivid as any romancer or painter could present them. My point is that primitive man so believed, and wrote, and prayed for deliverance from Evil Spirits. Hence the Typho of Egypt, Ahriman and Angro Mainyu of Persia, the serpent, dragon, or Tiamat of Babylon, are as emphatic of such belief as the Serpent of Eden and the dragon of the Apocalypse. Mr. Schuyler's beautiful poem is only a part of the truth. Men have ever attributed to Satan more than is his due, but that does not *prove* the non-existence of such a being, who is oppugnant alike to God and man.

History shows that the belief of mankind and their inscribed records are quite as explicit on this matter as the Hebrew and Christian writings. It is testimony which would carry conviction with any modern jury who found upon the facts as presented. It is the verdict of myriads who would find otherwise if they could. I certainly would. It is no comfort or solace to me to believe in a region occupied by rebels against Heaven, who have exiled themselves from His presence and the enjoyment of holy companions. Nor shall I trouble, like Ely for the Ark of God, if you marshal all your resources, and *prove* that the records and inscriptions named above are modern devices, and so not credible as presenting primitive belief. If they were written 5,000 years ago, more or less, and have been preserved to this day, they demand honest consideration, and are not to be explained away. Learned Germans and Frenchmen, learned English and Americans have studied, translated and commented upon them, but none of them have found or pronounced them spurious, unhistorical, or false in recorded facts. Can you show they do not express the belief of those ancient peoples, and that properly rendered they do not narrate belief in fallen angels having a chief over them?

Such belief must be accounted of and accounted for historically, before we can safely scout it. The consensus of universal mankind is not to be set aside by any modern notions of science or self-evolved theories. As it was with primitive man so it is now with few exceptions, mankind believe in a Being of tremendous powers for mischief; who first rebelled in heaven, and then tempted and seduced men on earth to rebellion. This ancient belief is expressed in legends coupled with legends of creation; the fall of the angels and the sin of the first man are narrated in a similar way; the decree of penalty and punishment is also given. Such is the history. To regard it as a human invention, the product of imagination in men of poetical temperament, who lived upon fruits and flowers,—men in the scattered regions of the ancient world,—requires more faith than I possess. Science and theory must fail as against such attested facts. If the history is authentic, the facts must stand. Can you disprove the legends and the facts?

E. COWLEY.

[The universal belief in spirits no more proves the real existence of spirits than the universal belief in witches during the middle ages can be used as a testimony in favor of witchcraft. Believers in devils who are possessed of a lively imagination, will

see, and hear and converse with devils. They will take their hallucinations as reliable experiences, and other believers will not doubt their circumstantial and realistic accounts. Goethe says: "*Das Wunder ist der Glaubens liebster Künd.*"

But although devils are not spiritual beings or real persons, the idea of "future suffering for wrong-doing in life present" is a truth. I refer by way of illustration to the Arabian Parable translated by H. Byron, No. 30, p. 839 of THE OPEN COURT. All wrong-doing has evil consequences which the wrong-doer himself, his children and others also will have to bear. The iniquity of the fathers will be visited upon the children and upon the children's children unto the third and to the fourth generation.]

#### MATTER AND FORM.

MORRIS, April 30, 1888.

To the Editor of THE OPEN COURT:

Please permit a friend to call your attention to the editorial in the last number of THE OPEN COURT, "Idealism, Realism and Monism," where to my understanding one or more fatal errors are found in direct conflict with our pet notions of the monistic theory.

On page 921, at the close of the last paragraph but one, I find this declaration: "Matter alone will never be made to account for the problems of nature."

We naturally conclude the purpose of the passage is to declare the sentiment of the foregoing article. This conclusion is farther strengthened by qualifying matter as an *inert substance*, in the beginning of the same paragraph.

Now if you intended to say that Matter is a *dead, lifeless mass of itself*, that must be operated by a foreign power to work out the phenomenal "problems of nature," it could not have been stated in more unmistakable language. If this is your meaning I have entirely misapprehended your monistic views heretofore as declared in No. 24, in the article, "Monism and Religion," an early editorial where you place yourself on record as to your Monistic views.

That the monistic idea admits of a supervening power distinct from and outside of matter, from whatever source, on which matter is dependent for its energies of life and action, is not my conception of the term. Certainly if the term *inert* is properly applied to matter as denoting its nature, such power is indispensable. This admission is virtually falling back on the mytho-theological basis, which we do not admit.

Since you have had charge of THE OPEN COURT I have been more than pleased with your style and the soundness of your Monistic sentiments, and I have confidence that you can and will at once straighten out these seeming irregularities. Fraternally, a co-worker. L. A. FISHER.

[Mr. Fisher is right in not admitting any "supervening" or "foreign" power acting upon matter, and I believe that our editorials did not leave any doubt in that respect. The source of our difference must be sought for in a different conception of the term matter.

Matter is an abstract. This means that it is a generalized conception of all the innumerable sensations and notions which we have of material things. The adjective *material* denotes the qualities of extension and weight, and, of course, *material* excludes other qualities, for instance velocity, heat, color, feeling, thinking, etc. According to the materialistic view the phenomena of life spirit, etc. can be explained from matter, and from matter alone. We do not think so, for we believe that spirit, life, feeling are qualities of reality which are not included in matter and which cannot be explained from matter either.

Matter, being an abstract, does not exist of and by itself. It exists only in and by reality. It exists in and with the objects of our environment from which we have abstracted our notion of matter. We shall never find an object which is matter and nothing

but matter. Every material thing (and all things are material) has also a certain shape; which shape (just as much as matter) makes the thing to be what it is. Take for instance a bronze figure; the matter of the statue is not all what you perceive, you also see a certain shape or form, and this non-material part of the real thing is indeed its most important and perhaps most valuable part. If you declare that you will explain the whole bronze figure from the material alone of which it consists, I should call you a materialist.

From the standpoint of monism we maintain that the elementary conditions of life, especially those of feeling, must be inherent in matter. But we do not say that matter alone (*viz.*, matter denoting extension and weight) will suffice for an explanation of life. Mechanical explanations of life from an outside pressure, as for instance the pressure of a weight in a clock, have hitherto proved failures. Materialism has for the sake of consistency been led to explain gravitation also by this principle of an outside push upon the inert matter. But such theories (as propounded by Le Sage and others) must still be considered as untenable hypotheses.

I say that the materialistic view is wrong, because you must take into consideration that form also is necessary for a correct conception of reality. Matter is not form and form is not matter. Both are abstractions from reality, both are generalizations of certain qualities perceived in reality. Neither form nor matter are entities which exist by themselves and apart from reality. They are both to be found in reality, from which our conceptions of them are taken.]

#### NATURAL RELIGION AND MONISM.

To the Editor of THE OPEN COURT:

The persistency with which modern thinkers still pander to the religious prejudices of the masses is one of the most deplorable concomitants to the present realistic and monistic school of thought. Though the motive may be pure, being, no doubt, prompted by the laudable desire to make the transition from a hoary superstition into the enlightened realms of modern thought as enticing and agreeable as possible, yet I think the popular method of dealing in half-truths, disguising facts and using religious nomenclature to convey ideas strictly antithetical to religious thought should be scorned by every true reformer.

Judging from the able review of Prof. Seeley's *Natural Religion* published in THE OPEN COURT, this work abounds with startling inconsistencies and deplorable absurdities. For instance: "His (the author's) position on other points is thoroughly monistic; i. e., he finds in the order and the oneness of the Universe, which science has made evident to man, the Deity and the religion of the future." Any schoolboy can, no doubt, instantly discover in this simple statement an example of the glaring inconsistencies and absurdities referred to.

The sense and meaning of the term "Monism"—"Oneness"—absolutely excludes and makes impossible the dualism of nature and of the Deity spoken of; and the Professor's *Natural Religion* is either regular old school Theology and a God supreme, or it is pure Monism—nature only—supreme. It cannot be both. Neither can the two be reconciled or harmonized. One is true, the other false, and if one survives the other must die.

Monism excludes a God, because it needs none and is self-sufficient unto itself. It embraces the great *All*—the infinite Cosmos in infinite space and recognizes and needs no power or God exterior, superior, interior or anterior to it. It is all, and in all seeks and finds, with Tyndall, "the promise and potency of all life." It needs no shrine for worship, and throughout the infinite realms of space, among the infinite aggregations of worlds and systems, it has not discovered a God or throne.

God, Divinity, on the other hand, implies personality, limit, outline, form, caprice, and these necessitate a physical-being and

organism. Worship, adoration, supplication, religion, etc., necessitate a being with brain, muscle and nervous system—one who can hear, see, reason and answer prayer. But the loftiest conceptions of poet or Idealist cannot picture such a God except in the anthropomorphic garb of a *man*. This is the sole and original conception of the God of Genesis, and the accumulated genius and intelligence of the nineteenth century cannot improve on it. And such a God is the only true God, *if there is a God*; but such a God is a mockery and a fetish.

Again I quote: "The power that holds the universe together—that gives unity to nature, that makes it *One*, can therefore be worshipped, because it supplies to man the law of life." Here we have another example of the author's utter incomprehensibility of the true synthesis of nature. There is no such a "Power" that can or ever could give anything to nature. Nature is all, ever was, and ever will be all. All powers *are* it and part of it, and no power exists outside of it to give it unity or to supply anything. The laws of life also were never "supplied," but are co-existent with the universe and existed long before man on this planet, and are eternal. "The power that holds the Universe together" is invested in each atom, in fact *is* each atom, as the atom and this power can not be separated. And these atoms, when composing a world or system or universe, possess no more attributes of Divinity than a decomposed leaf of my fragrant Havana circling in the air. They see not, hear not, reason not, and man's supplications, thanks, or curses would be but so much energy foolishly wasted. As one atom attracts another, as a magnet attracts steel, entirely without thought or volition, so these atoms, without thought or volition in infinite aggregation, *hold themselves together* in sun, moon, star and system. It is a perpetual motion of infinite numbers of batteries, chemical processes, and physical operations that simply act fortuitously and of necessity. Idealists have ever sought, but never found, in an imaginary greater power, beyond the universe, the cause of all existence and life, the Naturalist seeks and finds it in the invisible atom, tiny and humble in itself, but infinite and omnipotent in inconceivable aggregation.

Unless Prof. Seeley and his school of pseudologists can demonstrate how a God with a brain can be infinite, or a God without a brain can be a God, they had better withdraw their literature, let Monism alone, and join the nearest church. Above all let us be honest and consistent. OTTO WETTSTEIN.

Rochelle, Ill., May 13, 1888.

[Our correspondent is right in denouncing any pandering to the prejudices of a "hoary superstition," but it seems as if he were not just toward his adversaries. At this present day "God" is believed to be a great and good old man by children only. And we shall probably look in vain for a person who imagines that God has "brain, muscle and a nervous system." In trying to liberate others from their superstitions, a freethinker must not impute to them conceptions which they do not entertain; and he must at the same time freely and candidly point out what is true and what is false in their notions. Such equitableness becomes the freethinker much more than the bigot, for the freethinker *is* or at least *pretends* to be without prejudices, and aspires to judge *sine ira ac studio*. This uprightness of criticism, moreover, is not only fair, but will prove more helpful in truly advancing humanity on the path of free thought. By being just in acknowledging what is right in the old religions, we shall be all the better able to show them what is wrong. Such an impartial and equitable standpoint prevents us from becoming radical bigots—a class of people who are no less orthodox and narrow than the religious bigots.]

#### CEREBRAL SCIENCE.

BOSTON, April 21, 1888.

IN THE OPEN COURT of September 15, an article headed "The Old and New Phrenology," contained so many careless and enor-

mous statements that it would seem necessary to mention some of them as the public generally know but little on this subject and are easily misled.

The writer speaks of Phrenology as a science of bumps or bumpology, but persons of respectable intelligence on such subjects know that Phrenology was established by Dr. F. J. Gall, as a doctrine of the anatomy and physiology of the brain, with which the skull was associated only as indicating by its form the development of the brain.

Gall was the pioneer teacher of the *true anatomy of the brain*, and what he taught became the basis of modern cerebral anatomy. His merit as an anatomist alone, if he had made no other discoveries, should entitle him to scientific immortality. The name of his pupil Reil is immortalized in the anatomy of the brain by the name "Island of Reil," given to a small part of the brain. It has been common since the deaths of Gall and Spurzheim to neglect the proper recognition of their anatomical discoveries, embodied in their memoir to the French Institute, but Reil and Loder, themselves, among the most eminent anatomists of their time, spoke of Gall, after attending his dissections, as a wonderful anatomist, whose discoveries were of the most marvelous character, greater as they said than it would seem possible for one man to have discovered in a life time.

The details of the organology of Gall and Spurzheim have been generally approved by all who have tested them in the *only proper manner*, the examination of the *development* of the brain in men and animals, and I might give a long list of the names of eminent scientists chiefly of the medical profession, who have endorsed them. But the details were of course inaccurate, as any science must be in its first development. Nevertheless the fundamental doctrine which Gall established against a powerful opposition, is to-day recognized by all, and even Brown Legnard, who is the most ultra opponent of special localizations, to an iconoclastic extent, says in *The Forum* for April:

"Only very confused ideas were current up to the time when Gall undertook to establish his well known doctrines. Science owes to that great thinker an irrefutable demonstration of the necessity of admitting that each distinct mental or physical cerebral function requires for its performance absolutely distinct organs. No one now among philosophers, physiologists, or physicians, denies the correctness of this fundamental principle."

It does not diminish the value of this statement, that he also declares Gall's localizations to have disappeared in the progress of science, for he does not admit the validity of evidences which satisfy others, and he is equally hostile to the localizations which are supposed to have been demonstrated by Fremy, Charcot, Fritsch and Hitzig, Broca and others.

It remains incontestable that Gall outlined first the true anatomy of the brain, and also the fundamental principle of its physiology, both of which are now recognized as permanently established. As to his special localizations, and the additions of Spurzheim, physiologists have made little progress in determining their validity, because they have abandoned generally the method of Gall and Spurzheim, that of judging from comparative development, and have adopted methods which are excessively laborious, tedious, and I might add, hopeless for any complete determination of central functions.

Nevertheless, tedious and unsatisfactory as their methods have been, they have succeeded in confirming substantially three of the localizations of Gall; and yet physiological writers invariably neglect to state that the location for the faculty of language demonstrated in aptosis, is the original location of Gall but slightly extended. The reason perhaps is that they know so little of the localities described by Gall, in consequence of neglecting his writings.

My own experiments by more practical and simple methods

have established the substantial correctness of a majority of the locations of Gall and Spurzheim, only a small number of which were entirely erroneous. These discoveries and demonstrations have been presented for many years in medical colleges and tested before investigating committees with unanimous acceptance wherever presented, but are not extensively known, in consequence of their limited production. They will appear in due time in a series of volumes, but have been only briefly stated in the "System of Anthropology," published thirty-four years ago. At present they are being presented in the *Journal of Man*.

I have no objections to criticisms upon that notorious charlatan and ignoramus, the late O. S. Fowler, but it is exceedingly unjust and discourteous to introduce the names of such persons as if they were in any sense the representatives of any science, and it is hardly worth while to discuss any further such remarks as these: "As the frontal brain develops and broadens the forehead, the skull does not always keep pace with this growth, so that one with a narrow or even low forehead may have a large brain compressed into narrow compass." Intelligent persons know that brains are not made of elastic materials, and that ridges upon the bones of the skull are not the index of cerebral development.

The science of the brain has a duplex character, which was not recognized by Gall. He looked for psychic functions, as more recent explorers have looked for physiological. Both exist; for the brain is the commanding center of physiology as well as psychology. I have shown that each portion of the brain has a definite and demonstrable influence upon physiological processes, and at the same time a definite psychic influence. The explorations of the psychic functions gives us that understanding of the soul which has not been and cannot be obtained by any other method. It demonstrates a psychology, the perfection, beauty and satisfying completeness of which astonish those who become acquainted with it.

JOS. RODES BUCHANAN.

## BOOK REVIEWS.

THOMAS BAILEY ALDRICH, the editor of the *Atlantic Monthly*, will contribute to the June *Scribner's* a poem in his lighter vein, entitled "Corydon—A Pastoral."

The frontispiece of the May *Magazine of American History* is an elegant and life-like portrait of the late Alfred S. Barnes, whose interesting career is sketched by the editor in a graphic account of the way in which he founded his great school-book publishing-house. It is a story with a moral which every young man in America might read and consider to advantage. A scholarly study follows of "Ancient Society in Tennessee," in which General G. P. Thruston, of the Tennessee Historical Society, shows very conclusively that the mound builders were Indians. This is one of the ablest articles on the much-discussed subject ever presented to the reading public in popular form, and it is destined to be an authority in all the future. Other papers, as "Between Albany and Buffalo," "Personal Recollections of Abraham Lincoln," "The Fisheries Treaty—a Canadian View," etc., are no less interesting. The several departments of this valuable publication form a small compendium of history in themselves. Price, \$5.00 a year. Published at 743 Broadway, New York.

In the *Atlantic Monthly* for June, Houghton, Mifflin & Co., Boston, Theodore Child's article on "The Literary Career in France" is a timely contribution to periodical literature, inasmuch as there is just now so much discussion in the newspapers concerning the rewards and drawbacks of authorship. Some new and significant information, of particular moment to historians and geographers, is contained in an article by Francis Parkman, entitled "The Discovery of the Rocky Mountains." Ellen Terry Johnson

writes in a manner at once thoughtful and graphic concerning Madame des Ursins, her wild ambition, and her great influence. The serial chapters in the June *Atlantic* are continuations of the study of Japan by E. H. House. The Yokohama shopkeeper whom Mr. House introduces will be recognized by all who have traveled in the East as a faithful picture of many of the low commercial adventurers who infest Japanese sea-port towns. Recent American fiction and biography are passed in review by skillful critics, and, together with notices of other books of the month, conclude an excellent number.

WIDE AWAKE for May is as bright and sunny as a May morning. The beautiful frontispiece (after Steffek's famous painting) shows the late Emperor William and his brother when boys, in company with their famous mother, Queen Louise. A brief article about the Emperor, with a portrait from his last life-photograph is timely.

"President Madison's Family," with its beautiful portraits of Dolly Madison and other members of the family, is very chatty and entertaining. These glimpses into the home life of the children of our presidents appeal forcibly to every American boy and girl. Young coin collectors will turn first to the "Pleasures of a Young Numismatist." Mrs. Clark's "Rise and Fall of the Migot" is delightful in its fun, which "goes home" to every lad who has owned an amateur printing press. Several jolly poems add to the entertainment furnished. The more substantial features include "In a Typhoon," by Olive Risley Seward, "Chinese Dragons," by Professor Douglas of the British Museum, "Night in a Beaver Town," by Edmund Collins. In the June issue will begin Mrs. Crowningshield's serial of training-ship life, "Plucky Smalls: His Story."

Newsdealers have this issue for 20 cents, or it will be mailed by the publishers, D. Lothrop Company, Boston. A sample back number of any of the Lothrop magazines costs but 5 cents, or of the four for 15 cents.

ANIMAL MAGNETISM. By Alfred Binet and Charles Féré, Assistant Physicians at the Salpêtrière. Translated into English. New York: D. Appleton & Co.

Mesmerism, we learn from this book, had its origin towards the middle of the sixteenth century. Dr. Mesmer ascribed to man the ability of exercising on his fellows a power analogous to that of a magnet. Subjects when put to sleep present an acceleration of the pulse and of the breathing; the subject sometimes makes a direct reply to questions addressed to him, but is generally unconscious of any sudden noise made at his ear. The eyes are closed. On raising the eyelids the pupil is seen to be contracted and turned upwards, the surface of the body is insensible to pain.

Braid proved that hypnotism could be produced by fixing the eyes on a given object for a few moments, that the character of the sleep is not always the same, that breathing on the face had the effect of changing the hypnotic state, and breathing on it a second time caused the subject to awake. Formerly magnetism made use of what is termed passes. The passes consist in lightly touching the subject either directly or indirectly through his clothes, and a prolonged repetition of these gestures produced sleep. But discredit was thrown on magnetism by experimenters who caused subjects to sit opposite them, pressed their knees against their own and grasped the thumbs of the subjects with their hands and sometimes applied their foreheads to those of their subjects for experiment. These gestures which appeared indecent, were founded on accurate observation, and it has since been verified, that they are most effective.

Sensorial excitations produce hypnosis in two ways: when they are strong and abrupt, and when they are faint and continued for a long period. Hypnosis is induced by suggestion and the personality of the operator. The first attempt to hypnotize nearly

always fails and usually succeeds when the experiment has been repeated several times. It has long been a disputed question whether every person could be put to sleep, and it has been ascertained that nervous people and those suffering from hysteria are most predisposed to hypnotic sleep—and if one has never been hypnotized his consent and good will are necessary for the operation. Hypnotic sleep which is produced with so much difficulty and delay in fresh subjects, occurs rapidly with those who have been long under treatment, some patients being hypnotized by a single abrupt gesture. In the case of some subjects the hallucination begins and ends during somnambulism, in others it is more permanent and persists during the waking state. Hallucination may be destroyed by three different processes: by Suggestion, by Physical excitement and by the Magnet.

Paralysis by means of Suggestion is an interesting branch of Hypnotism. If a somnambulist is impressed with the idea that his right arm is paralyzed, we see the limb lose its motor power, but the strength of the opposite arm is increased so as to compensate to a certain extent for the loss of the paralyzed arm, and the paralysis has been known to be prolonged for twenty-four hours.

The Paralysis of the Will is termed Aboulia; for instance if a patient is thirsty and requests a glass of water but cannot make up his mind to take it when it is brought, although he wished to drink and his arm is not paralyzed. When Campanella, a celebrated philosopher and physiognomist, wished to know what was passing in the mind of another, he imitated as well as he could the attitude and countenance of the person in question, and at the same time concentrated his attention on his own emotions. Although hypnotism exhibitions are liable to produce nervous affections, yet it is now generally admitted that hypnotism offers the twofold advantage of enlarging and isolating the states of consciousness. M. W.

DISSOLVING VIEWS IN THE HISTORY OF JUDAISM. By Rabbi Solomon Schindler. Boston: Lee and Shepard.

In nature and history we may observe a process of dissolving views, such as an operator may throw by a magic lantern upon a screen. One creation fades away while the other rises into view. It was the plan of the author of this book to picture in every one of his lectures some prominent person of Jewish history, and all the Israelite heroes from Moses to Montefiore pass by before our eyes in a grand procession.

The spirit in which the book is written can best be characterized by a passage from the introduction, which is worth quoting at full length:

"It is no difficult task for an architect to erect a building upon a vacant lot. He can break the ground according to his plans, and even if he has to blast here and there a rock that crosses his way, or if, as upon made land, he has to drive a number of piles into the soft ground, such obstacles are easily surmounted,—his work can progress systematically, and the walls will rise up at an early day. A far more difficult task it is for him to remodel an old house, to build where something else stands already. It is slow work to tear down a foundation without harming that portion of the building which rests upon it, and, as in old buildings the cement has often become hardened to such a degree that the stones would rather crack than be lifted out of the layer of mortar by which they are held together, it requires the utmost caution not to destroy more than is desirable. If to-day a race of the human species could be found which, though intellectually ripened, has never heard of religion, it would be comparatively an easy task to teach such people a creed which would be purely itself and free from any admixture of superstition; religious reformers, however, do not find such a desirable material, they must take men as they are, they must build on ground upon which something else stands already, they are compelled to remodel old structures, to tear down on one side and to build up on the other. They find fre-

quently the most valuable material so deeply encrusted in errors, or errors so deeply imbedded in excellent material, that all efforts to separate them are hopeless, and the stones not seldom break before the mortar will yield.

"Right in the very foundation upon which the structure of religion is reared, we have come in our time to detect an error which must be removed before we can think of altering and improving the building. This error is so deeply and so firmly imbedded that it will require time and repeated and strenuous efforts to lift it from its sockets. It is the error that religion is something solid, something that has been settled long ago, something that, like Minerva, has sprung from the head of a God in perfect condition, and has remained perfect to this day. Every religious sect holds that for an unknown length of time all mankind has been sunk in superstition, that not a ray of light had pierced the spiritual darkness, until at last God had sent their own prophet as a messenger, and had revealed to them the only true religion. Since then, this religion has remained the same, and the same it must remain forever. Being perfect, the very thought of improving it becomes an absurdity, as improvement implies a state of imperfection. Every attempt to alter the original religion would be sacrilege, it would be followed by disastrous consequences, and must, therefore, be suppressed at whatever cost. At the same time such zealots do not know that their alleged original religion was an innovation at the time of its birth, and had been obstructed by exactly such zealots as they are.

"Whenever the question is raised, what is Judaism, Christianity, Mohammedanism, or Buddhism, the propounders of the question expect a short and definite answer; they suppose that these religions can be described like as many concrete objects, and they feel disappointed when evasive answers are forthcoming, when from a thousand persons they receive a thousand various explanations. The fact is that religion is not a firm substance which can be counted, weighed, or measured, but that it is something ethereal, that it has been and still is constantly changing its forms and ingredients, that it has been one thing at one period and another at some other time; that it is one thing to one man and a different thing to the next. The fault rests with us if we fail to see, or do not wish to see, that religious thoughts must have kept stride with the accumulation of experiences, that religion has been simply the formula by which every age has expressed its highest intellectual attainments. In a people of limited knowledge, with a narrow intellectual horizon, lofty religious principles can neither be found nor expected to be found, while a low standard of religion has always betrayed a low standard of civilization. Religion has followed as naturally the progress of humanity in arts, sciences, and experiences, as the shadow follows the movements of the sun on the dial. It is of all grave errors the gravest to presume that religion has fallen meteor-like from heaven, some thousand years ago, and has since then remained unchanged, and it is equally absurd to presume of Judaism that it could be defined or described in a few words, as if it had been the same thing at all times and to all generations. The genial town-folks of Schilda could sooner hope to catch the sunlight in a mouse-trap and to carry it into their windowless meeting-house, than we could hope to catch the volatile essence of Judaism within the wire grating of some definition."

IN THE POPULAR SCIENCE MONTHLY for June Mr. Spencer makes an incisive answer to the Duke of Argyll's criticisms of his views, which were published in the May number of the "Monthly." Professor W. Preyer discusses in the same number "The Imitative Faculty of Infants."

We call attention to the advertisement on the last page of this issue. We are in full sympathy with the *Ethical Record* and wish that the new publication may prove successful.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XVI.—Continued.

The Historian now brought his daughter up to her and the worthy gentleman at last placed himself near Ilse and talked to her for a long time; she felt with pleasure that this was a great distinction. Afterward she ventured to move some steps from her place in order to ask the wife of Professor Raschke to sit by her. Thus, before long, a charming little circle of acquaintances collected about her. The pretty Frau Günther joked pleasantly and gave her explanations about the strange ladies and gentlemen. The wife of the Rector also came up and said she must sit near her, as she observed that all were so merry about her. And her "Ladyship" darted glances here and there which attracted one gentleman after another to the group; and all who wished to show their respect for her "Ladyship" paid their compliments also to the wife of the colleague. There was a coming and going all around her like a fair, and Ilse and her "Ladyship" sat there like two twin stars, the brilliancy of one increasing that of the other. All went well and charmingly. Ilse was delighted beyond measure, and there certainly was more shaking of hands in her vicinity than comports with the etiquette of a ball. When Felix approached her once and looked inquiringly at her, she pressed the tips of his fingers gently and gave him such a happy smile that he needed no further answer.

During a pause Ilse looked along the sides of the room and perceived the wife of Professor Struvelius on the opposite side. She wore a very dark dress and her Sappho lock hung seriously and sadly from her fine head. The wife of her husband's enemy looked pale and her eyes were quietly cast down. There was something in the bearing of the lady that moved Ilse's heart and she felt as if she must go over to her. She revolved in her mind whether Felix would think it right and was afraid of meeting with a cold objection; but at last she took heart and walked right across the room up to the learned lady.

She had no idea of the effect produced by this step. Ilse had attracted much more attention and had been much more sharply watched than she knew, and those present were more occupied with the quarrel between the two professors than she imagined. As she now went with firm step up to the other lady and stretched out her hand, even before she reached her, there was a remarkable stillness in the room and many eyes were directed to both ladies. The wife of Struvelius rose stiffly, descended one step from her seat, and looked so freezing that Ilse became nervous and could scarcely frame her lips even into the every-day inquiry after her health.

"I thank you," replied the lady. "I do not enjoy noisy gatherings. It is, perhaps, because I am entirely deficient in all the necessary qualifications, for people are only in the right place when they have an opportunity of making their talents in some way available."

"As to my talents, they will go for nothing," said Ilse, shyly; "but everything is new to me here and therefore it entertains me much to look on, and I would like to see everything."

"It is quite a different thing with you," replied the other, coldly.

Fortunately this embarrassed conversation was soon interrupted, for the wife of the Consistorial Councillor popped into the group like a curious magpie in order to mediate philanthropically or to take a part in this startling scene. She broke into the conversation and talked for a short time on indifferent subjects.

Ilse returned to her place much chilled and a little discontented with herself. She had no reason for it. Little Frau Günther said to her gently:

"That was right, and I am much pleased with you."

Professor Raschke darted up to her and did not allude to it, but he called her constantly his dear Frau Collega. He asked her anxiously whether he could not bring her something good—tea or lemonade. He admiringly took the finely carved fan that Laura had pressed upon her from her hand and, in order to take care of it, placed it in the breast-pocket of his coat. Then he began to amuse her by telling her how, as a student, he had taught himself to dance in his own little room, in order to please his wife, and in the eagerness of the relation, he began to show Ilse the way in which he had privately learnt his first steps. As he was swinging round, the swansdown of the fan projected like a great feather out of his pocket, and a new dance beginning, the Professor was carried off through the whirling couples with Laura's fan.

It was only a few steps that Ilse had taken through the hall; but this little expression of independent will had gained her the good opinion of the University; for, if there had been some remarks upon her country manners, now, on the other hand, men and women agreed in acknowledging that she had heart and character.

According to old custom, the ball was here interrupted by a general repast. Worthy professors had already wandered beforehand into the neighboring room, peering at the laying of the table, and had carefully placed their cards in the places they reserved and arranged with the waiters about the wine. At last the whole company gathered about the table. When Ilse went on her husband's arm to her place, she asked, in a low tone:

"Was it right in me to go over there?"

And he replied, gravely:

"It was not wrong."

With this she was for the present obliged to be content.

During the supper the Rector proposed the first toast—"The Academical Society"—and the assembled gentlemen thought his slight allusion to friendly concord among the colleagues touched in an indelicate way on the burning question of the day. But this effect passed away immediately in other toasts, and Ilse remarked that the supper speeches here were carried on very differently to those in the Rollmaus family. One colleague after another clinked the glass; and how elegantly and intellectually they knew how to portray things with their hands behind their backs and looking coolly around, and alluding, in fine sentences, to the guests, the ladies and the rest of mankind. When the corks of the champagne popped, the eloquence became overpowering, and two professors even clinked their glasses at the same time. Then rose the Professor of History; all became still. He greeted the new members of the University—women as well as men—and Ilse saw that this applied to herself and looked down on her plate. But she grew alarmed when she found that he became more personal, and at last her own name, as well as that of the wife of the Mineralogist, who was sitting by Felix, sounded through the room. "The glasses resounded, a flourish of trumpets was blown, many colleagues and some of the ladies arose and proceeded with their glasses toward them." A little procession took place behind the chairs, and Ilse and the Mineralogist's wife had to clink their glasses incessantly, to bow and return thanks. When Ilse rose blushing for this purpose, her eyes glanced involuntarily to the next table, where the wife of Struvelius was sitting opposite, and she observed that the latter half moved her hand toward her glass, then quickly drew it back, and looked gloomily down.

The company rose, and now the hilarity began in good earnest, for the Professors became lively, and called to mind their old agility. There was a changed aspect in the room, for soon even respectable, middle-aged gentlemen waltzed with their own wives. Oh, it was a cheering and touching spectacle to Ilse! Many an old dress-coat and clumsy boot moved to the measure; and many of the gentlemen danced with various slidings of the feet, and bold movements of the knees, determined to recall the style of their youthful days, and with the feeling that they still understood the art. Some of the ladies clung shyly to the arms of the dancers, some were ungraceful in their movements, others showed how well they were able to govern at home,—for, when the husbands were not sufficiently practiced in the art, they knew how to carry them round the circle with vigorous swings. The Rector danced very neatly with his chubby wife, and Raschke danced with his

wife, and looked triumphantly toward Ilse. The noisy merriment increased; all Ilse's neighbors were carried away by the excitement, and commenced waltzing. And Ilse stood looking on not far from a pillar. Somebody came behind and touched her; there was a rustling of a silk dress, and the wife of Struvelius approached her.

Ilse looked startled at the large grey eyes of the opponent, who began slowly:

"I take you to be noble-minded, and quite incapable of any mean feeling."

Ilse bowed slightly, in order to express her thanks for the unexpected declaration.

"I go about," continued Frau Struvelius, in her measured way, "as if a curse were on me. What I have suffered the last few weeks is unutterable; this evening I feel like an outcast in this joyous gathering." Her hand trembled, but she continued, in a monotonous tone: "My husband is innocent, and is convinced that he is right in the main. It is fitting for me, as his wife, to share his views and his fate; but I see him inwardly disturbed by an unfortunate entanglement, and I perceive with dismay that he may lose the good opinion of his most intimate friends, if he should not succeed in dispelling the suspicions which gather about his head. Help me!" she cried, with a sudden outburst, wringing her hands, while two big tears rolled down her cheeks.

"How can I do that?" asked Ilse.

"There is a secret in the affair," continued Frau Struvelius: "my husband was incautious enough to promise unconditional silence, and his word is sacred to him; he is a child in matters of business, and is quite at a loss what to do in this affair. What may be necessary to justify him must be sought without his knowledge or co-operation. I beg of you not to refuse your assistance."

"I can do nothing that my husband would disapprove of, and I have never kept a secret from him," replied Ilse, seriously.

"I desire nothing that the strictest judgment could condemn," continued the other. "Your husband must be the first to know whatever I may be able to ascertain, and therefore I apply to you. Ah! not only on that account; I know no one whom I can trust. What I now tell you I have not learnt from Struvelius: he received the unfortunate parchment from Magister Knips, and he returned it to him."

"Is that the little Magister in our street?" inquired Ilse.

"The same. I must induce him to produce the parchment again, or to tell me where it is to be found. But this is not a place to discuss this matter," she exclaimed, as the music ceased. "Situated as our husbands now are, I cannot visit you; it would be too painful to me, should I meet your husband, to feel his altered demeanor; but I wish for your advice, and beg of you to allow me to meet you at some other place."

"If Magister Knips is concerned in the matter," replied Ilse, with hesitation, "I would propose to you to come to the room of our landlord's daughter, Laura Hummel. We shall be undisturbed in her room, and she knows more of the Magister and his family than we do. But I fear we poor women can hardly accomplish much."

"I am determined to risk everything, in order to free my husband from the unworthy suspicion which threatens to be cast upon him. Prove yourself to be what you appear to me, and I will thank you on my knees."

She moved her hand convulsively, and then looked about her with an air of indifference.

"We shall meet to-morrow," replied Ilse; "so far, at least, I can agree to your wishes."

They then settled the hour.

Thus the ladies separated. From behind the pillar Frau Struvelius once more gazed imploringly at Ilse with her large eyes; then both were lost in the throng of the departing ball-guests.

After her return home, Ilse long continued to hear in her dreams the music of the dance, and saw strange men and women come to her bedside, and she laughed and wondered at the queer people, who chose to visit her now as she was lying in bed without her beautiful dress and fan. But in the midst of these pleasant musings she felt a secret anxiety as to what her Felix would say of all these visitors; and when she gently sighed over this anxiety, the dream floated back towards the ivory portals from whence it had come. She sank into a sound sleep.

The following morning Ilse went up to Laura and confided to her the events of the previous evening, and the request of Frau Struvelius. The secret meeting with the Professor's wife quite pleased Laura. She had for some time past more than once heard about the mysterious parchment at the tea-table. She thought the determination of Frau Struvelius very courageous, and spoke with contempt of anything that Magister Knips could contrive.

Just as the clock struck Frau Struvelius entered. She looked much oppressed, and one could perceive anxious excitement even through her immovable features.

Ilse shortened the unavoidable introductory compliments and excuses by beginning:

"I have told Fräulein Laura of your desire to obtain the parchment, and she is ready to send over directly for Magister Knips."

"That is far more than I had ventured to hope," said Frau Struvelius. "I had intended with your kind assistance to look him up myself."

"He shall come here," said Laura, decidedly, "and he shall answer for himself. I have always found him unendurable, although I have frequently bought pretty

pictures of him. His humility is such as does not become a man, and I consider him a sneak at heart."

The cook, Susan, was called, and despatched by Laura as a herald to the fortress of Knips.

"You are under no consideration to tell him that any one is with me, and when he comes, bring him up directly."

Susan returned with a sly look, and brought the Magister's compliments, and "he desired her to say he would have the honor of waiting upon her immediately. He seemed astonished, but pleased."

"He shall be astonished," exclaimed Laura.

The allied ladies sat down around the sofa-table, feeling the importance of the task which was before them.

"When I am talking with him," began Frau Struvelius, solemnly, "have the kindness to attend accurately to his answers, that you may in case of necessity repeat them, and thus be my supporters and witnesses."

"I can write quickly," exclaimed Laura; "I will write down what he answers, then he cannot deny it."

"That would be too much like a trial," interposed Ilse, "and will only make him suspicious."

The furious bark of a dog was heard outside.

"He is coming," said Frau Struvelius, drawing herself up with dignity.

A loud step was heard on the stairs, Susan opened the door, and Magister Knips entered. He did not look dangerous. He was a little crooked man; it was doubtful whether he was young or old. He had a pale face, prominent cheek-bones, on which were two red spots, screwed up eyes such as short-sighted people generally have, and red from much night-work by dull lamps. He stood there with his head bent on one side, in a threadbare coat, a humble servant, perhaps a victim of learning. When he saw the three ladies sitting, all stern and solemn, where his heart had only hoped to find one, and among them the wives of important men, he stopped confounded at the door; he composed himself, however, and made three low bows, probably one to each lady, but refrained from speaking.

"Sit down, Magister," began Laura, condescendingly, pointing to an empty chair opposite the sofa.

The Magister approached hesitatingly, pushed the chair further out of reach of the three goddesses of fate, and with another bow seated himself on the corner of the chair.

"It must be known to you, Magister," began Frau Struvelius, "that the last publication of my husband has occasioned discussions which have been painful to all engaged in them, and I assume also to you."

Knips made a piteous face, and dropped his head entirely on one shoulder.

"I now appeal to the interest which you take in the studies of my husband, and I appeal to your heart, when I beseech you to give me frankly and straight-

forwardly the information which must be desirable to us all."

She stopped; Knips, with bent head, looked askance at her, and also remained silent.

"I beg for an answer," said Frau Struvelius, emphatically.

"With all my heart," began Knips at last, with piping voice. "But I do not know what I have to answer to."

"My husband received from you the parchment which gave rise to his last treatise."

"Did the Professor tell you that?" asked Knips, still more piteously.

"No," answered Frau Struvelius; "but I heard you come, and I also heard that he promised to be silent about something, and when I entered his room later I saw the parchment lying on his table, and when I enquired about it, he said, 'that is a secret.'"

The Magister looked round about uneasily, and at last cast his eyes down on his knees, where his trousers were unusually threadbare and smooth from wear.

"If the Professor himself considers that the affair is a secret, it is not for me to speak of it, even if I did know anything about it."

"Then you refuse to give us the information?"

"Ah, my dear lady, there is no one to whom I would rather make a communication than to the excellent ladies whom I have the honor of seeing here, but I am much too insignificant to be able to serve you in this."

"And have you taken into consideration the embarrassing consequences of your refusal, for my husband, for the whole University, and—what you, an advocate of truth, must consider more important than all—for science?"

Knips acknowledged himself to be the advocate of truth.

Laura remarked that the examination was wandering into by-paths on which the parchment was not to be found; she jumped up, and cried out:

"Go out of the room for a little while, Magister Knips, I wish to confer with the Professor's wife."

Knips rose very readily and made a bow.

"But you must not go away. Go into the next room. Come, I shall call you in again directly."

Knips followed her with bowed head, and Laura came back on tiptoes and said, in a low tone:

"I have locked him in, that he may not escape."

The ladies put their heads together in close consultation.

"You deal too tenderly with him, Frau Struvelius," whispered Laura; "offer him some money, that will allure him. It is hard for me to say so, but I know the Knips family, they are selfish."

"I also have thought of that, for an extreme case,"

replied Frau Struvelius, "only I did not wish to hurt him by such an offer, if there were any manly feeling in him."

"Pshaw!" exclaimed Laura, "he is not a man, he is only a coward. If he refuse at first, offer him more. Here is my pocket-book; I beg of you to take it."

She ran to her writing-table and fetched out the embroidered purse.

"I thank you from my heart," whispered Frau Struvelius, taking out her purse from her pocket. "If there is only sufficient," she said, anxiously drawing the strings. "Let us see quickly how much we have."

"God forbid!" cried Laura, hastily. "It is full of gold."

"I have turned everything that I could into money," replied Frau Struvelius, hurriedly; "everything else is of little value."

She took the purses out of the hands of both ladies and said firmly:

"That is far too much. We ought not to offer him such sums; we do not know whether we should be exposing the poor man to the temptation of doing wrong. If we offer him money we embark in a transaction which we do not thoroughly understand."

The others disputed this, and there was much whispered consultation. At last Laura decided:

"He shall have two pieces of gold, that is settled."

(To be continued.)

## THE ETHICAL RECORD.

Issued quarterly. Contains contributions by Prof. Felix Adler, Messrs. W. M. Salter, G. R. Weston, W. L. Sheldon, Dr. Stanton Coll, and others; also, news of the Ethical Movement at large and notes of special work done in the Ethical Societies of New York, Chicago, Philadelphia, St. Louis, London, etc.

## WHAT MIND IS.

BY PROFESSOR E. D. COPE.

The difficulties in the way of the acceptance of a belief in the control of mind over matter, arise, as is well known, from a consideration of the nature of matter and energy. It is idle to dismiss these difficulties in the easy way adopted by idealists and semi-idealists; for whether we know much or little about matter and energy, both unquestionably exist, and both have their immutable laws. Any treatment of the subject which does not embrace these prime factors, must be rejected by rational thinkers as inadequate.

To the absolute materialist, the known properties of matter and energy preclude the belief in a control of either by mind; and with the rejection of this belief we must abandon all ideas of persistency of mind, that is of the possibility of the immortality of consciousness, and of the existence of a primitive or supreme person. From this point of view it follows that with the disappearance of protoplasm from the universe, mind would disappear; and that the development and extension of mind depend on the production and distribution of protoplasm. But the facts of observation do not sustain this side of the question any better than they do the position of the idealists.

Nothing is better known than the fact that motions of the animal organism take place under the stimulus of conscious states, as of hunger, cold, fear, anger, etc.; and that those motions have direct reference to the sensations thus experienced. It is true that the proper relative motion to be made under the stimulus of a sensation, has to be learned by animals; but the stimulus is a sensation, and the experience gained is due to sensations. The memory involved is a mental sensation, and the general rules learned after much experience, are also mental sensations. Whatever the intrinsic relations between these classes of sensations may be, they all come under one general head, which, by common consent, is called consciousness. Of course the motions which take place with reference to conscious states are the movements of masses. These movements are due to releases of energy (as muscular contractility, supplied by nutrition, heat, etc.) set on foot by the nervous energy, or what represents it in the lowest animals. This energy,

as is well known, arises from the nervous centres, whence it has been released by energy of the sensory type, which is due to stimulus derived from some form of energy external to the body, either molecular (sound, etc.), or molar. As has been remarked, the outgoing motion has a rational relation to the incoming stimulus, and it is therefore believed that at some point in the process, and at some place in the organism, the direction of the outgoing energy is determined. The position of such direction has been more or less exactly ascertained by physiological research. The acts involving the greatest degree of intelligent design receive their stamp in the cerebral hemispheres, and as we retreat from this region backwards and downwards along the nervous axis, the outgoing motions are less and less intelligent in their character and more and more devoted to primitive and organic processes.

It is generally supposed both by physiology and by common thought, that an animal organism does, in the manner and at the place above defined, determine the course of the energy of motion, through an intrinsic property of its life, which is called *will*. This term is usually restricted to the direction of motions which display especial design, and which are performed during a conscious state, and especially to those which require some effort. Such acts are called "voluntary." Such acts, however, become, by repetition, "habitual;" and when thoroughly learned by the organism may be performed unconsciously, thus becoming "automatic," and "reflex." An act of will is not only a vital act, it is a mental act; for will is an aspect of mind. The point at which it can be no longer called mental as it enters the automatic stage, is not easily fixed. It is perhaps not a hard and fast line. We cannot enter on a discussion of this point here.

This "will" must not be confounded with "free will." The direction of energy which it signifies, is always strictly under the dominion of motives, which are also mental conditions, and which are themselves the result of experience. The lowest form of movements cannot be said to be due to any motive other than that of the agreeable sensation it produces; while the higher are due to most complex considerations, the resultant being the "strongest inducement." With "free-will" we have therefore nothing to do at present.

The will as above defined signifies a determination of the direction of energy (and therefore of matter) in accordance with the desires and designs of consciousness; that is, with reference to pleasure and pain, of lesser or greater degree. It does not mean that energy is created, but that it is directed or determined. Creation of energy is not possible under the law of conservation of energy. But it is also claimed that a direction of energy is equally impossible; and that it is as much in violation of the law of conservation of energy as would be its creation. If we treat this question scientifically, however, we must, I think, be led to a different conclusion. It is simply impossible to explain the movements of animals and men in any other way than by the usual supposition that they control these movements by mental process, in response to stimuli from without or within. We have no reason to believe that designed acts were first learned in unconsciousness, and that consciousness merely observes that they are being performed. We know on the contrary that designed acts *have to be learned*, and that the condition of learning is attention, which is a high degree of consciousness. To secure this attention stimulation of consciousness must be employed, as is well known in the breaking and training of animals, and the education of children. In any case, *effort* is necessary. This is an exercise of will by which the attention of the mind is directed to and kept on the matter to be learned. Among animals in a wild state, the environment furnishes the stimulation, and with the consciousness and memory which they undoubtedly possess, their education has gone steadily forward from the dawn of life to the present day. As I have elsewhere remarked, this education has formed their habits, and thus directed their movements, conscious and unconscious; and these have led the changes in their structure, causing the phenomena of evolution.

We may better realize the directive character of consciousness, so far as it can be realized, by expressing the fact as I have done\* in the language, "that energy may be conscious." This relieves us of the dualistic idea, that a something (consciousness) can exist apart from energy and matter, and influence them from the outside. This is not the state of the case. The situation is monistic; matter and energy *may be conscious*, and remain so under proper conditions. Under certain other conditions this attribute disappears.

We are now prepared to consider the nature of the act of will. This must be done under its two aspects, the automatic and the truly voluntary. In the case of designed acts which are automatic, the reason for the automatism is known to be due to the existence of a completed mechanism through which the energy passes

from the primary stimulus to the outcome in action. It must be remembered, however, that this result has come about through education, which consists of various more or less successful attempts to accomplish the design, until final success is reached. Failure to execute an act when first attempted, does not preclude the idea of the control of the mind over the material of the body, but proves that the correct mode of accomplishing the result has to be learned. The control consists in the construction of molecular mechanism by which the act is ultimately performed without effort of consciousness. This is the history of the origin of the innumerable "automatic voluntary" acts of animals, and it is probable that all the reflex and organic activities, except those that are purely physical and chemical, may have had their origin in this way in the long past ages of geologic time.

Will, then, as a mental *act* directed towards the non-mental environment of the mind, controls the movements (energy) of that environment. This statement may be called occultism, and I suppose, justly. But such is the fact, and in that fact we perceive one of the especial characteristics of mind as compared with energy and matter. The act of willing consumes energy, but the direction given to the execution by that will has no mechanical equivalent. Now, this fact harmonizes perfectly with another fact of mental action, which illustrates and enforces the doctrine here defended. Acts of will are dependent for their character on mental *motives* which may have been of long or brief presence in the mind prior to the act. Motives are the product of emotional or intelligent states, or more usually of both in co-operation. Now, the mechanical equivalent of thought-processes cannot be a measure of the content of the thought-process. I have expressed this proposition in the following general form: "The *amount* of thought can most assuredly be measured; the *quality* of thought can not." \* The motive is a judgment or preference resulting from the emotional or rational state, or both; and it is evident that though every act of judging or preferring costs energy, the mental considerations involved in forming such judgments and preferences cannot be expressed in terms of energy. In other words consciousness has a field of its own where it ranges free from the bonds of energy. And out of this field issues the will, which is the act of coercion of that which is outside the field of mind.

The occult relations of mind to matter then are two; first, in the acts of will; second in the acts of reaching judgments or motives. It is evident that both before and after the construction of automatic mechanisms, occasions for decisions between alternatives arise. Where mechanisms exist, this means

\* Origin of the Fittest; Art. Catagenesis, p. 328.

\* Proceedings American Philosophical Society, 1891, Origin of Fittest, p. 205.

a choice as to which of two or more of them shall be used to accomplish a given result. An animal which is pursued by another, may run into a hole or may ascend a tree for safety. In the two cases totally different muscles are used. The animal, *for reasons*, elects to use the one set rather than the other set. Another animal may throw one ear forward to catch a sound rather than the other ear. Mechanisms to accomplish the movement of both exist. In this case the animal *directs* the energy to one set of muscles rather than to another. Or an animal will use both ears alternately, or turn the head from side to side, to hear and see what is behind, each time choosing which muscles it will move. This is the common will of the animal, acting from the simplest of motives, not free, of course, but none the less a remarkable property of protoplasm, conscious and unconscious. No inorganic machine can do this.

The question now arises, what relation do these decisions bear to the amount of energy expended in the resulting act? A physical movement costs energy, and a mental act costs energy. The act of willing costs energy, and the more perfectly the act is performed, and the method of doing it is understood, the more perfectly is the energy consumed in those processes, and the less dissipated as heat. But does the decision to use the left hand, eye, or ear cost more or less than the decision to use those of the opposite side? Evidently not. Does the decision to climb a tree cost more than the decision to enter a hole? I venture to say that it costs a man no more to decide to build a house, than to decide to stand a brick on end, so far as the act itself is concerned. It is true that the process of reaching one motive may cost more than the process of reaching another, on account of the greater number of elements or questions involved in one than are in the other. But the rational relation of the conclusion to the premises is a question of consciousness all the way through. And the conclusions are reached for sensational reasons, not mechanical ones; but even in the latter case the fact of a conclusion being reached for "reasons" places it outside of the mechanical category. It is an extra-physical process.

The reason why the control of mind over energetic matter is so limited in our experience, appears to be, that the primitive elements of mind, sensation, and memory, are qualitative as well as quantitative equivalents of energy. The qualitative relation of memory to energy is, however, very remarkable. Its precision appears to be in *inverse* ratio to the strength of the sensory impression. In other words the more violent the impression the less exactly is the sensation reproduced; while the more delicate and refined the sensation the more certainly can it be reproduced.

Violent pleasures and pains cannot be reproduced in memory. The sensations of the special senses can be feebly reproduced in some persons; sight more perfectly than any of the others. Emotions may be reproduced by memory, but in a weakened form. It is only purely intellectual processes that are exactly reproduced both as to character and intensity. These facts\* lead us to suspect that strong sensations destroy the physical basis of memory. It is also evident that as memory is a part of the rational processes, it persists in a physical basis whose sensations are the least obtrusive, although of the highest importance; a physical basis to which ordinary sensation is conveyed rather as a matter of information than as a present fact. In fact every kind of conscious tissue has a memory of its own function, and the highest form, that which reasons, has information of the sensations of all the rest. Whether memory has any occult functions may be questioned, but it must be remembered that generalization is impossible without it.

Thus we have reached the important conclusion that all matter which performs designed acts, exhibits a metaphysical quality which is not correlated with the quantity of energy it expends in so acting. It is by virtue of this quality that mind gives direction to energy, and therefore to matter, without violating the law of conservation of energy. This is impossible on any dualistic conception of these relations. Quantitatively, mental processes are an expression of energy; qualitatively (purely), they are not, and the directive element in mind belongs to the qualities and not to the quantities. This is perhaps the most important fact which can be known to man. It embraces in its scope the general relation of mind to the Universe, both as master and servant of matter, and is full of promise of future growth. It shows us what Mind is, and that while it cannot violate the axiomatic properties of matter, it has control enough to make its existence good rather than evil.

#### ECONOMIC CONFERENCES.

II.

BY WHEELBARROW.

"This is Daniel in the lions den," said the showman, "and you will observe that Daniel doesn't care a copper cent for the lions; and by looking closer you will notice that the lions don't care for Daniel." A good resemblance to Daniel was Mr. Lyman J. Gage, confronting the working men at the Madison Street Theatre, and showing them the beneficence of National Banks. A very good resemblance to the lions was the eager crowd glaring upon him and waiting to devour him. To the credit of both parties be it said that neither was afraid of the other.

\* I have enumerated them in the *American Naturalist* for 1886, p. 83.

It was only natural that we should gaze with curiosity, if not with awe, at a living millionaire, that abnormal development of American equality; that we should wonder how he lived, and on what meat he fed. I always feel exhilarated when I hear a courageous man defend his own opinions, whether I agree with him or not; and it was like a wholesome tonic to hear a National banker before a hostile audience maintain the just and useful character of his trade. Some of the crowd were disappointed when they looked for the cunning eye and hard features which are said to be types of millionaire faces in Chicago. This man's face was refined, if not strong, and classic rather than coarse. A gentle presence is of great importance to a speaker, and good looks often help lame logic.

Some high-caste ladies "graced" the boxes, but their presence was too evidently a condescension. Like the rich woman who confessed that she once went out as far as Evanston "to see the peasantry," those ladies had come to see the laborers of a great city in economic conference with a banker. They looked down upon us very much as the patrician wives of Rome looked down from the boxes in the Coliseum upon the plebeians below.

Mr. Gage advocated our present banking system as a necessary and valuable ingredient in American social organization, and in this he was right, if the prevailing conditions that encompass labor, trade, and capital, are natural, just and wise. A large majority of his audience, however, believe that the National Banking System is an eruption on the surface of society indicating impurities within, and this impression Mr. Gage did little to remove. He reasoned thus: Exchange of products is a good thing, banking facilitates exchange of products, therefore the *National Bank System* is good. I see a fallacy in this reasoning although I may not be able to separate it from the tangle of the argument. I have heard the war praised by stump orators in the same way. They said the National Banks provide a sound currency, because the notes are secured by national bonds, which are secured by national debt, made by national war. No war no debt, no debt no bonds, no bonds no banks, no banks no currency. I know this chain has a flaw in it although it appears to be sound.

Mr. Gage, instead of defending the National Bank System as a monopoly necessary to a safe currency maintained that it was no monopoly at all, and he gave us the dictionary meaning of the word monopoly. Working men care little about the etymology of a word, or the Latin or the Greek of it; we regard only the fact it expresses. It may be true that monopoly means the "sole power" to carry on a certain business, and that National Banks have no such power because any five men with fifty thousand dollars may

start a National Bank; nevertheless, if the law confers upon National Banks certain privileges which other banks have not, then to the full extent of those privileges they have a monopoly. I do not mean that every monopoly is mischievous because it is a monopoly, it may in fact be beneficial to the community, but this is what Mr. Gage ought to have shown to the working men.

When Mr. Gage gave us the catalogue of powers and privileges enjoyed by the National Banks, he forgot to mention the most important one of all, the exclusive right to issue currency. A prohibitory tax of ten per cent. upon the circulating notes of all private banks and bankers limits the issue of currency to the National Banks. The reason given for this is the duty of protecting the people from what is known as Wildcat banking, and I am inclined to think that the reason is a good one. I regret that Mr. Gage avoided this question, because the prejudice of the working men against the National Banks is largely built upon a misunderstanding of the "money power," given to the banks by the exclusive privilege to issue currency.

Although the title of his lecture was "Banking and the Social System," Mr. Gage made no attempt to show any moral agreement between the National Banks and our social system. The one part of his theme had no relation to the other. He spoke on the social question and he spoke well, but he has placed himself under the yoke of the political economists, and allowed himself to be awed by their portentous jargon and their stately axioms. He is a victim of the patent medicine men who profess the "contemptible science." They take a few accidental facts, generalize them into a principle, express this in a rotund formula, and then impose it upon everybody as an orthodox prescription. After comparing the labor "trusts" and the capital "trusts," and showing that any unnatural profits made by either of them must result in drawing competitors to the trade or business in such numbers that the profits vanish, leaving the competition behind to plague the investors of the trust, Mr. Gage was betrayed into the mistake of wrapping up his whole argument in the ponderous old formula compiled by the medicine men about the rate of wages. He said, "the wages of labor will rise and fall as the number of wage-workers increases or diminishes in relation to the existing quantity of capital. If capital increase in a greater ratio than the population, wages will rise. If the population increase in a faster ratio than capital, wages will fall. No combination can long resist the silent but irresistible influence of this principle."

I think there is no such principle, and the claim for it appears to have no foundation except an occa-

sional example. We see it verified in particular cases, and erroneously think that it is of universal application. I am often stunned by the heavy maxims thrown at me by the economists, and before I have time to recover my senses I have confessed their claim. Long ago I was confused by this maxim, but when I brought a little moral intelligence to bear on it, I saw that its character was bad, and as it was unsound in ethics I knew that it was unsound in politics too. Out of it grows the arrogant theory of a "surplus population," the surplus being always the unemployed poor, and never the unemployed rich. Out of it grows the cannibalistic doctrine that working men must eat one another or perish. It makes every wage-worker the competitor and the enemy of every other. It elevates war to the dignity of a moral science because it kills men and diminishes the number of wage-workers. Capital never makes wages except for its own profit, population makes wages by creating a demand for supplies. Very often the wage-worker creates the capital before he can draw any share of it as wages. Like a pin in a toy balloon one touch of reality explodes the whole doctrine and reduces it to collapse. Let us apply the pin to the air-balloon sent up by Mr. Gage, "if capital increase in a greater ratio than the population, wages will rise."

In 1884, Mr. Blaine, in a carefully prepared paper, said that the capital of the United States had increased from fourteen thousand million dollars in 1860, to forty-four thousand million dollars in 1880. An increase of thirty thousand million dollars in twenty years, although during four years of that time the wealth of the nation was wasted in war, and wage-workers were killed by the thousands. Does not the touch of this one statement explode the balloon? Will Mr. Gage pretend that wages increased in the ratio of increased capital, even allowing that it increased at all? His formula might be correct if amended thus: "If capital increase in a greater ratio than the population wages *ought* to rise." His proposition fails because there is no power in social economics to compel capital to pay high wages, but population is driven by natural forces to make wages because men must eat, wear clothes, and live in houses. To provide for its own comfortable existence population sets all the wheels of industry in motion. The workers create the capital, and we invent an economic contradiction when we make increased capital attendant on the diminished number of the people who produce it. Men are driven to supply their own wants by labor, and thus make wages for each other. The reason they do not make high wages is because their energies are not free; artificial obstructions are placed in the way of industrial ambition; the worker's natural resources are withheld from him by law, and that "increased

capital" which Mr. Gage thinks raises wages, is combined successfully in a hundred ways for the purpose of keeping wages down.

Because the working men themselves have been led into many follies and some crimes through their belief in Mr. Gage's doctrine, I wish to show its influence on them. It did more than any other article in Labor's creed to freeze up the sympathies of the English working men. We were always praying for war so that "capital might increase in a greater ratio than population." When cholera swept the land we saw the triumph of Mr. Gage's principle and rejoiced. When a colliery explosion killed two hundred men, although we felt actual sorrow, there was mingled with our grief some abstract joy, for the ratio of population to capital was lessened, and we had fewer competitors in the labor market. This false economics hardened our hearts and debased our character. How could there be brotherhood among men who believed they were taking bread from one another? I was cured of the doctrine by an old farmer in Vermont, and I cheerfully advertise his recipe.

Shortly after landing in this country I got a job of work in building a railroad near the town of Windsor in that State, and the digging was very hard. One day we were knocked off on account of rain, and I put in the day doing chores for a farmer whose house was close to the shanty where I lived. That night he gave me a good supper, and after supper we sat outside on the door step and "calmly smoked and jawed." I felt that I was an intruder upon the United States because I was adding one more to the labor population, and diminishing the rate of wages in that "ratio." My farmer friend was polite enough to say that no apologies were necessary, and that the obligation was all on the other side; that in point of fact the United States of America was much indebted to me for coming. "I reckon you," he said, "as a clear gain of one thousand dollars to the capital of the country." This wild heresy bewildered me, and I explained to him that I did not bring five cents with me to buy a welcome, but he insisted that brawn and brain were part of a nation's capital, and the source of all its capital, that population and capital must increase and diminish together, and that they were not antagonistic factors in fixing the rate of wages. I see now that he was right, although I did not see it then; and while particular exceptions to his principle may be found in actual business, yet I am convinced that when applied to the vast aggregate of the nation including all its population and all its capital, his doctrine is morally and politically sound.

I follow the old man's argument as well as I can; it was something like this: A healthy young man of twenty, working on the railroad, receives as wages

one dollar a day. Allowing for loss of time by reason of rainy days and other causes, and giving him two hundred and fifty days work in a year, he receives in ten years two thousand five hundred dollars. His work is worth more than that. He has certainly put three thousand five hundred dollars into the railroad values of the country. This is a contribution of one thousand dollars to the capital of the nation in ten years. This rule will apply to all the other workers, and Mr. Blaine's figures are evidence that the estimate is low. Admitting that large numbers of men are a loss instead of a gain, that they eat more than they earn, nevertheless, when the national balance is struck the result is an enormous aggregate gain. Another test is this. Every generation leaves behind it something for the succeeding one, proving that increase of population and increase of capital are in direct proportion to each other, and that the relations between them are not to be estimated by the Inverse Rule of Three.

I once heard a judge tell a lawyer that statutes are to be construed in favor of human life. This rule extends beyond human codes. It is the law of the moral universe, and political economy cannot reverse it. The doctrine quoted by Mr. Gage is in favor of human death. It makes living men a dead weight upon the public weal, a dangerous paradox. What does Mr. Gage himself say in refutation of his doctrine? He says this: "With a population of sixty millions this country is sparsely settled, and will support under good industrial conditions two or three hundred millions in peace and plenty." Why then does he moralize about imprudent marriages and a redundant population? In that one sentence he surrendered himself a prisoner to Mr. Schilling. If the country possesses the abundant natural advantages which Mr. Gage describes, why are a million wage-workers out of work? If the country is "sparsely settled," why do men jostle each other and suffocate each other in the labor market? If "the treasures of mineral wealth beneath the surface are inexhaustible," why is not their opulence developed? Is it not because capital owns the key of the underground cellar and keeps it locked from labor? Mr. Gage's admission that the country is sparsely settled while its natural resources are inexhaustible was a strong support to the claim of Mr. Schilling that labor shall be given access to the surface of the earth, to the forests upon it and to the minerals below.

When Mr. Gage advocated "co-operation industrial and otherwise" as a social remedy, there was loud applause in the pit and in the gallery, as if he had just condescended to patronize one of the absolute virtues such as temperance, honesty, industry, or brotherly love. Perhaps the most elastic and changeable bit of sham in the labor debate is the "co-opera-

tion" excuse for the mistakes and offenses of "organized capital" and "organized labor." Co-operation is not a principle, it never was anything but an expedient, a plan, sometimes wise and sometimes not; sometimes good and sometimes bad. It may be virtuous or not, according to its purpose and its action. What do you co-operate for? is the test question that must be answered by the Knights of Capital, and by the Knights of Labor, and upon the answer the quality and value of the co-operation must depend. The co-operation of the Knights of Capital to develop coal mines and bring the coal to Chicago is beneficial, but the co-operation of Knights of Capital to raise the price of coal is mischievous. The co-operation of the Knights of Labor to raise their own wages is good; their co-operation to lower the wages of other men is bad. The co-operation of the Knights of Capital to boycott their workmen who refuse to "sign the document," is tyrannical and unjust; the co-operation of the Knights of Labor to boycott the craftsmen who decline to sign their document, is equally tyrannical. Co-operation is good only so far as its aims and methods are generous and just.

In my youth I received some benefit through the efforts of a benevolent society for the education of the poor. It is very gratifying to me that I have lived to return the favor. Two months ago I had the honor to organize in the City of Chicago a society for the education of the rich. The pupils are becoming numerous, but we hope to have schools large enough to accommodate them all. It is a melancholy sight to see so many ignorant rich, destitute of proper instruction, rushing blindly downward "without God and without hope in the world."

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.

BY FELIX L. OSWALD, M. D.

Part VIII.  
HABIT.

"Whatever is pleasant is wrong," summarizes the distinctive tenets of a creed which has for centuries biased the ethics of the Aryan nations, and found its fullest expression in the asceticism of the Buddhist world-renouncers. The charge of impious ingratitude fails to influence the converts of a doctrine which supplements the belief in the total depravity of the material world with the dogmas of supernaturalism, and transfers its hopes from the disappointments of the present to the unalloyed beatitude of a future existence.

"That doctrine," says a champion of Utilitarian ethics, "is a mere survival of demonism, involving a belief in a system of creation so diabolically arranged that all its sweets are secret poisons and its pleasures nothing but baited traps."

"Nothing else," would be the orthodox reply, for the world is the devil's own."

But the belief in the sinfulness of temporal gratifications implies the logical converse of making the avoidance of pleasure a habitual rule of conduct, and thus demonstrates the self-contradicting absurdity of anti-naturalism, since by the influence of habit the sources of affliction tend to become sources of enjoyment. Instinctive preferences and aversions are merely the outcome of ancestral modes of life, continued through a long series of generations; and the origin of our so-called moral intuitions is strikingly illustrated by the influence of personal habits.

The short average life-term of our latter-day generations suffices to turn the habitual performance of irksome duties into a matter of spontaneous preference: A path of routine, pursued at first in quest of remote and indirect benefits, eventually produces its own daily and direct rewards. Acts, often repeated in defiance of instinct and conscience, are soon performed with callous indifference, and at last even with positive predilection. The Spanish conquerors of the New World employed a species of bloodhounds descended from the gaunt shepherd-dogs of the Spanish sierras, and in spite of their reckless courage, at first extremely reluctant to "use their fangs on the image of God," as Las Casas expresses it. They had to be whipped and bullied into compliance with the commands of their ruthless masters, but after a certain amount of practice would follow the trail of an Indian as their ancestors had followed the trail of a wolf, and at last came to prefer a man-hunt to every other kind of sport. The first sight of a slaughter-house inspires a child with an instinctive horror which has often been used as an eloquent argument in favor of vegetarian theories. During an Easter picnic in the mountains of Puebla, Mexico, I saw a little boy run shrieking from the side of a cook who had just cut the throat of a kid; and failing to engage the sympathy of the jeering bystanders, the emotional youngster flung himself down at the foot of a tree, and for nearly an hour hugged a pet poodle-dog with convulsive sobs. Hindus will starve for weeks, rather than imbrue their hands in the blood of a fellow-creature and shudder at the mere sight of a meat-axe.

Yet our professional butchers so thoroughly overcome that natural horror, that the veterans of our slaughterhouses may often be seen smoking their pipes or whistling a pleasant tune while their hands are shedding continuous streams of gore. With a similar indifference the overseers of the Cuban slave-plantations ply their cruel whips; and I have known army-surgeons, who performed the ghastly work of the operation-table with all the equanimity of a professional wood-carver. Even military homicide, the most dreadful

of all duties, may become a pleasant pastime, and I may confidently appeal to the experience of all veteran soldiers, if I say that every protracted war develops a certain percentage of amateur manslaughterers who, fight for carnage, rather than for conquest, and survey the hecatombs of a bloody battlefield very much as a sportsman would examine the trophies of a successful *battue*. Ali Pashaw, the Turkish Mithridates, seems to have rather encouraged that disposition in his followers, and had regiments who "howled for battle," quite irrespective of political or religious animosities. Suwaroff, too, had whole companies of such man-butchers, and confessed that on several occasions (as during the capture of Ismael) he would not have *dared* to check their fury of slaughter.

"Ein Schlachten war's, nicht eine Schlacht zu nennen," —and during the age of hand to hand conflicts battles often enough ended with the total destruction of the vanquished army, as on the fatal field of Xeres de la Frontera, where the *tukbeer*, the victory-shout of the Moslem fanatics, gave the signal for a remorseless massacre of the Gothic host.

Still more numerous is that class of routine-soldiers who learn to plan and practice the wholesale destruction of human life as a common trade, and go through the routine of flanking and routing a hostile force with absolute disregard of collateral consequences. "The first sight of a dismembered horse," said an old artillery-officer of my acquaintance, "gave me a sort of physical pain; it seemed to twist my heart, as well as my stomach; and I turned away with the impression that I should never get used to the spectacle of mangled human bodies. After a while, though, military murder became a mere problem of target-practice. During the last engagement of our battery, when I saw forty men go down at a single discharge, I remember that my only emotion was a professional regret that the scattering of a Gatling-gun volley could not be confined to a horizontal plane of distribution."

Repeated experience still more strangely steels the heart against the symptoms of mental agony which at first appeal so irresistibly to the sympathies of a compassionate soul. In a contribution to *THE OPEN COURT* (Vol. I, No. 5,) Prof. James Parton describes his unspeakable anguish on witnessing the grief of a poor mother whose only son was forced to bid his native land a long farewell; but in the minds of veteran jailers and bailiffs far more harrowing scenes excite only a circumstantial interest. "If you have anything like human hearts," said the sister of a condemned deserter, "let me see my poor brother's face once more; he is the only friend I ever had in this world, and I have traveled forty miles afoot to tell him good-bye."

"Wonder if she's going to slip him a file?" whispered the old turnkey.

In times of protracted public calamities that moral callousness becomes more general, and in the famine-stricken cities of China and Hindostan whole families have often starved to death in the public streets at the very door of the charity-commissioner who contents himself with entering their names in his district book and deducting the daily sum of corpses with all the opium-smoking complacency of a cattle-yard inspector.

Under the influence of habit the virtue of industry is gradually becoming a secondary instinct, and in many cases assumes the force of a controlling passion. In the neighborhood of Santiago, Cuba, I once saw an old mare walking slowly in a circle which by a long series of circuits had been worn into a glassless ring. There was no driver near, nor any visible motive for exertion, but the old nag turned and turned with indefatigable patience. "It's a mill-horse," explained my guide, "one of those old plantation hacks that are turning the machinery of the sugar-mills. She has tramped her rounds till she got too old to work a mill, but the habit sticks to her bones, so she now turns around in the open prairie."

To a country-boy, fresh from the sports of his native woodlands and mountains, office-work is, no doubt, as irksome as tread-mill work to an unbroken colt; yet our large cities abound with men to whom industry, in some form or other, has become a daily condition of happiness. I know an ex-registrar who in his old days fell heir to a snug fortune, and retired to the country for the avowed purpose of passing his last years in peace. But that "peace" proved less supportable than his wonted drudgery. Entertaining literature disagreed with his mental organism; social diversions failed to banish the demon of *ennui*, and, after sundry compromise plans, the proprietor of a fine country-seat volunteered the functions of an assistant postmaster, and regained his peace of mind in the elaboration of monthly reports and the double-entry records of registered mail.

The habitual exertion of physical energy is apt to make a less laborious mode of life unendurably insipid. There are men who fell trees and break horses from sheer force of old habit. "I've tried hot-house gardening," a retired back-woods farmer told me a year after his removal to his new city-home; "but, hang it, it seems too much like play to stand it in the long run. I'm going to try landscape gardening and haul up a few hundred good-sized shade-trees."

Under the inspiration of a similar impulse Elihu Burritt, the "learned blacksmith," would every now and then fling his grammars aside and make a grab for his sledge-hammer. Edmond About mentions a re-

tired guerilla-leader who used to inveigh against the immoral sloth of garrison-life; and there is no doubt that moral, rather than financial, considerations induce hundreds of business-men to prefer the drudgery of their counting-rooms to the elegant leisure of a bondholder's life.

Even with such qualifications as the pursuit of knowledge or gain, indoor life remains, at best, an unnatural mode of existence; but the power of habit goes further, and has more than once impelled pardoned prisoners to decline the boon of freedom, and return to the brooding inactivity of their dungeons.

#### PERSONAL IMMORTALITY.

There is nothing so pleasing to human expectation as personal immortality. To be assured of everlasting life without pain or care, without weariness or satiety, with friendships unalloyed and with knowledge ever increasing, makes all trouble and sorrow in this world seem as nothing—as the mere dust that floats with the passing breeze. But is this pleasing dream an inspiration? Do desire and expectation constitute an infallible premise upon which to found unquestionable opinions? And is there adequate compensation for the loss of these cherished ideals?

Man's body, like those of other animals, is composed of the elements of matter in chemical combination, and finally after its brief life, returns to form part of the original stock from which it was constructed. Does there dwell in this corruptible body an undying and incorruptible personality? Does the Creator do aught contrary to the universal and recognized laws of life and death? And is it not generally conceded that anything and everything that will live "to eternity" has existed "from eternity?"

The glorious sun must, in the nature of things, go out in darkness. The stars that "glitter on the mantle of night" must finally disappear. There may be a new birth of suns and stars, resultant from the same cause which placed those now shining in the heavens, and thus, by renewal, add light and lustre to the universe through a seeming eternity. So with all animate and inanimate life; it is immortal in the principle of reproduction, whose cycles roll on unceasingly unless checked by superior and antagonizing forces. Reproduction is therefore an immortal principle precluding the probability of personal immortality. With life ends man's usefulness to the world or to his Creator. Is it probable that he will be preserved for pain or pleasure, for reward or punishment? The monarchs of the forest may be reproduced for an eternity of years with unchanged and recurring seasons.

The grain of wheat from Egypt's tomb lost none of its vitality during a sleep of three thousand years. The frail, sensitive plant is equally immortal in its nature.

If there is anything on earth too beautiful to die, it is the rose. Yet with all its beauty and fragrance the hoar frost regards it not, and the summer's sun, after painting its loveliness, withers it without remorse, and but for the hope inspired by this reproductive principle, we should mourn its loss and weep at its destruction. Now we can truly say and rejoice that its beauty never fades and its fragrance is everlasting.

Is man an exception to this wise and wonderful provision of nature? And is it not ample compensation to know that old age, decrepitude and uselessness are to give place to youth, strength and beauty, and that man's intelligence and virtues become an immortal inheritance by his children? E. H. ROOD.

—[*North American Review*.]

#### GUSTAV FREYTAG'S NOVEL, 'THE LOST MANUSCRIPT.'

A letter lately received from Gustav Freytag causes me to state that 'The Lost Manuscript' has not been written for the purpose of spreading philosophical or social ideas. The author's only intent has been to create poetry and to truly picture life.

All the more, his ideas on the most vital question of human existence (which are so fully supported by the recent studies of the French psychologists as to make them scientific facts) being a natural outflow of the poet's brain, will take possession of the reader who goes further than reading for entertainment.

EDWARD C. HEGELER.

#### THE NATURE OF MIND.

*Mind* denotes the whole spiritual nature of man; it comprises the domain of his thoughts and sentiments, the remembrance as well as the purpose of his intentions, and the whole frame of his character. The word is one of the oldest and most indigenous expressions of our language. We can trace its origin at least as far back as that of any other word, and find that for several thousand years its primary meaning has remained about the same. If it has varied now and then in its application, the general tenor of the word has scarcely changed at all. The Sanscrit *manas* is the Latin *mens*; it has been used by the ancient Aryans in the same sense as the English *mind*, and also the Greek *νους* has not strayed far from its etymology. The Anglo-Saxon *Gemynd* is derived from the word *munan*, 'to think,' which is still preserved in the German *meinen*, 'to have an opinion.' The root *MAN*, from which these words have sprung, is found also in the English *man*, 'a thinking being,' German *Mann*, *Mensch* (originally *männisch*, i. e., manish, or belonging to the kind of thinking beings). Other derivatives indicate that the original meaning of the root *MAN* must have been that of 'memory.' The Greek *μνησθαι* means 'to remember.' From *μνησθαι*,

'mindful, bearing in mind,' and *μνηστικός*, 'having the ability of bearing in mind,' we derive the word *Mnemonics*, by which we denote 'the art of assisting the memory.' The German *minnen*, 'to love,' is one of the most beautiful of words; it also is derived from the root *MAN*, and its etymological meaning may be best expressed as 'a cherishing in one's mind in faithful remembrance.'

The deity of mental phenomena among the Teutonic nations was *Wöden*. He was the God of the aerial sky. He moved in the breezes of the atmosphere and was a personification of the 'air in motion.' As such he naturally came to represent spiritual manifestations. Similarly the Latin *animus* (spirit) and *anima* (soul) are etymologically the same as the Greek *άνημος*, wind (from *άνημι*, Sanscrit *an*, 'to breathe, to blow'); and the Latin *spiritus*, 'breath' (from *spīrare*, 'to breathe') came to mean in modern French '*esprit*' and in English *spirit*, 'a ghost.'

The word *ghost* has a similar pedigree. Its equivalent in German is *Geist*, and if both are connected with the Sanscrit *ya*, 'to seethe,' Greek *ζωω*, 'to boil,' we must recognize in the German *Geist* and in the English *yeast* humbler cousins of the more aristocratic word *Geist*.

The Icelandic Edda tells us that Odhinn (*Wöden*) had two ravens about him who reported everything that happened in the world and were the messengers of his commands. Among the Teutonic nations the raven was looked upon, and perhaps with more justice than the owl in Athens, as the bird of learning. A raven is clever and can be taught to speak. His stern appearance, especially the simplicity of his black coat, seemed to suggest that he must be thoroughly versed in secret lore. When the monks of the Middle Ages changed *Wöden* into the Evil Spirit, the venerable birds of pagan scholarly divinity became companions of the devil and sad omens of ill luck.

The ravens of Wodan were called Hugin and Munin; Hugin means 'thought' and Munin 'recollection or memory.' 'Munin' is derived from the very same root as the Anglo-Saxon *munan* and the English *mind*, while Hugin (which is still preserved in the name *Hugo*) is apparently intended to indicate the faculty of invention, viz., the ability of the human mind to create new ideas by combining the old materials of our memory into novel forms.

The gist of all this is that our ancestors considered memory as the fundamental property of mind, and we cannot but admire their keen power of observation when modern physiology declares that memory is the fundamental property of organized matter.

The word *Mind* is very different from the word *spirit*. While *spirit* may be used in the sense of a bodiless hobgoblin which is nothing but spirit, mind

always signifies a spiritual or intellectual faculty in a corporeal being.

According to the customary usage of the word, *mind* can not be separated from matter. If it were possible to separate mind from the organized matter in which it appears, (as oxygen may be extracted from carbonic acid,) we would no longer call it mind but spirit; and very probably this special application of the word *mind* as a phenomenon of the organized matter in living bodies, has produced its extraordinary stability and has prevented vagaries which can be observed in the history of the words *spirit* and *ghost*.

Mind accordingly is not a concrete something as are material objects; mind is a phenomenon which is manifested in certain actions of organized matter. It does not exist by itself, but exists in and with those living bodies from which we have abstracted our notion of mind. Similarly life is no thing by itself, nor does it exist apart from living beings. Life and mind (like so many other concepts) are generalizations of certain properties, abstracted from reality in which under certain conditions they can be observed as phenomena.

The question 'whether mind controls matter' can be understood in two ways: Either it means that a thinking being by means of his ability to think can control the motion of matter in giving direction to a certain amount of energy, or it means that mind alone, as something by itself and apart from the organized matter in which it appears, can act upon and control matter. The former is a fact which cannot be doubted, and the latter is an impossibility, since we know that mind by itself does not exist.

Mind as it appears in reality is neither energy nor matter, but it is a special form of energy working in some organism. Form is the essential characteristic of mind. The human mind is as much superior to the animal mind as the structures of human brain are superior to those of animal brains. There is little or no difference in the chemical ingredients of the different brains, and the amount of energy expended is of secondary importance.

But there is a great difference in form, the human brain having more complex and some additional structures. Similarly the difference between more or less effective machines is one of form. Let us take for instance an old steam-engine of former years and one recently built with all the latest improvements. Both may have been constructed from the same materials, both may be furnished with the same amount of coal, developing a certain amount of heat for a certain time. The difference of material in both machines, which may exist, is of secondary importance; the chief and essential difference remains that of construction, which is a difference of form;—a difference

which enables the one to do more effective work than the other. It is the form of the cogs and wheels which directs the motion of the energy produced in the boiler.

The form of the gear in a machine, if considered as form alone, apart from the material of which the machine consists and apart from the heat which makes it work,—the mere form may exist as a plan in the brain of the draftsman or as a sketch on the canvass of the draftsman but as a working instrument the mere form does not exist in reality. The mere form cannot drive the wheels and produce energy; and mind, the mere abstract mind, cannot be said to have any effect upon matter or to direct energy. But mind, as we find it in reality, the mental activity of an organism, the bodily reality of which is recognizable in certain forms of living brain structures,—this mind directs energy and has a powerful influence upon matter.

The word Mind sometimes has been used in the sense of consciousness. According to our notion mind does not exclude unconscious mental activity, but it certainly includes all conscious thoughts and feelings. Consciousness accompanies certain acts of our brain. Whether consciousness consumes a certain amount of energy has not as yet been ascertained by psycho-physiological experiment, but it is certain that consciousness by itself is *no* effective factor in the motion of our limbs. This fact can be relied upon since it has been proved by careful investigation and experiment.

Th. Ribot in his "Diseases of Will" distinguishes two things in voluntary action; the mechanism that produces it and the state of consciousness that accompanies it. The instances which he cites prove beyond the shadow of a doubt that the mechanism can also work automatically without the accompaniment of consciousness; but consciousness has in itself no efficacy. We are told, e. g., that a man of a diseased will whose muscular motor-apparatus was sound, intended to take a glass of water for which he had called and which was offered on a tray by a servant. Although the patient struggled earnestly to show self-control, he was unable to let his will pass into action. From such and similar instances Th. Ribot concludes: The 'I will' shows that a state of consciousness exists, but this does not constitute the situation. The 'I will' is like the verdict of a jury by a consensus, in which perhaps after a longer deliberation the stronger motives overrule the weaker ones. But the execution of the verdict which in the sane man is effected without difficulty, can be produced only through the mechanism of the will. From this mechanism will derives its force, and if the mechanism is deranged, the execution of the will is prevented.\*

\* See OPEN COURT, p. 490, "Th. Ribot on Will."

Consciousness, although having in itself no efficiency for making will pass into act, cannot, for this reason, be considered as a superfluous element. There is nothing redundant in Nature; how could consciousness be a superfluous factor? Consciousness may be compared to a light. It affords in novel and difficult situations the possibility of circumspection. The light in a machine room will enable the attendant workman to regulate properly the motions of the engine; but the light has no locomotive power in itself which can produce action. If the engineer is a novice he cannot do his work without light, but the expert knows how to direct the lever even in the dark. The consciousness of mental states may be indispensable for a proper *direction* of our will, but it does not possess motive power.

We gladly notice in Professor Cope's essay that in many respects our scholarly contributor agrees with this view. He says: "We may better realize the directive character of consciousness, so far as it can be realized, by expressing the fact as I have done in the language, 'that energy may be conscious.' This relieves us of the dualistic idea, that a something (consciousness) can exist apart from energy and matter, and influence them from the outside. This is not the state of the case. The situation is monistic; matter and energy *may be conscious*, and remain so under proper conditions. Under certain other conditions this attribute disappears." And later on Prof. Cope declares that "the effort of accomplishing the result must be learned. The control consists in the construction of molecular mechanism by which the act is ultimately performed without effort of consciousness." We also fully agree with Professor Cope when he says: "The act of willing consumes energy, but the direction given to the execution by that will has no mechanical equivalent."

But we are at a loss how to conform this monistic view with other propositions which must be considered as unequivocal dualism. Although consciousness, it is maintained, does not exist apart from energy and matter, Professor Cope objects to the view "that with the disappearance of protoplasm from the universe, mind would disappear; and that the development and extension of mind depend on the production and distribution of protoplasm."

Protoplasm, it must be mentioned, means the living substance which is the basis of organic life. On other planets may be found other kinds of protoplasm, but we do not expect to find mind independent of living substance. Moreover, when Professor Cope speaks of "a primitive or supreme person," he can only mean a supernatural God, whom, as I judge from other publications of his, he considers as absolute mind.

With such contradictory statements it is natural that

Professor Cope ends in occultism. What he calls "a mental act" consists: first, of consciousness which has no motive power in itself, and second, of energy (act) which *is* motive power. Confounding the mental attitude of consciousness with the energy expended in acts, he declares: "Will, then, as a mental *act* directed towards the non-mental environment of the mind, controls the movements (energy) of that environment. This statement may be called occultism, and I suppose, justly. But such is the fact, and in that fact we perceive one of the especial characteristics of mind as compared with energy and matter."

If a question is answered in a manner which maintains the view of occultism, this is to my mind a certain sign that the problem is not yet solved. From the monistic standpoint as explained above, I can see no difficulty in the problem as to how (if properly understood) mind controls matter. It is true that there are many things which are not as yet understood, and which demand the careful observation of physiologists and psychologists, but there is no philosophical obscurity in the matter. Accordingly there is no need of any supposition which searches for an explanation outside this world of ours, and we are not driven to believe in "a metaphysic quality which is not correlated with the quantity of energy it expends in so acting."

From the dualistic standpoint which makes of mind a thing apart from matter and energy, the problem as to how mind controls matter (like so many others) must appear as a most occult and incomprehensible mystery. Dualism thus makes of a natural phenomenon "an extra-physical process."

P. C.

#### A NEW RELIGION.

BY \* \* \*

The Creeds of old are crumbling;  
And were their revelation  
The only hope in living  
Life would be desolation.  
But lo! a new religion  
Bursts from the germs decaying;  
A new faith in our bosoms  
Is growing, light-displaying.  
Great truths with broader outlook  
New missions have created.  
By purified Religion  
Our souls are elevated.  
New aims, new hopes, new doctrines,  
Old prophecies fulfilling!  
And through our hearts is rapture  
Of progress warmly thrilling.  
We have no holy scriptures,  
Our lore is not dogmatic;  
In vague spheres transcendental  
Our creed is not erratic.

We do not combat freedom  
Of art, nor that of science.  
Nay, both with our religion  
Are joined in firm alliance.

Though high, our aspiration  
Is yet concrete and real.  
To render life more noble  
Is our sublime ideal.

Of this denomination  
Are they, in life's confusion  
Who further human progress  
And sweep away illusion,

Who have ideals, dearer  
Than self and self-existence,  
And love them, although knowing  
Their vast, enormous distance;

Thinkers who muse and ponder,  
Instructors theoretic;  
And poets, whose ideas  
Are radiantly prophetic;

The warrior, who for Freedom  
Fights and for Freedom dieth;  
The great, whose noble fortune  
With their souls' greatness vieth;

The hand, who with heart's trouble  
For wife and children toileth;  
The man, who doth his duty  
E'en if his fate him foileth;

And he, who kindly comforts  
The sick, who gladly shareth  
His bread with his poor neighbor,  
Our badge and symbol beareth.

## BOOK REVIEWS.

QUEEN MONEY. By the Author of the *Story of Margaret Kent*.  
Boston: Ticknor & Co.

The success of the story of Margaret Kent raised high expectations of any subsequent work that might come from the same writer's pen, and Queen Money is a story that will help establish the name which the author has already so worthily won. It is a novel of New York society life, told with spirit and intelligence, utterly without plot, but showing unusual skill in characterization, containing many pages of bright and earnest dialogue and conveying a wholesome moral. As is inevitable in this class of novels we have the usual range of characters, in Ellery Kendal, the bold unscrupulous young broker, Clayton White, the accomplished man of letters and agreeable cynic, Fanny Brockway, a married flirt, Otto March, the high-souled young hero, Lucy Florian, the redeeming angel of them all, whom all the young men of the book fall in love with, but who reserves herself for the hero.

The portrait of the child Ethel, inheritor of a strange untamable nature, equally compounded of artistic longing, and a depraved aspiration to shine in society before fairly out of the nursery, is the most original character in the book, piquing curiosity as to her future development which her early death brings to a sudden halt.

C. P. W.

BONAVENTURE. A Prose Pastoral of Arcadian Louisiana. By George W. Cable. New York: 1888. Charles Scribner's Sons. The author of "The Grandisseries" and "Old Creole Days" has enriched American literature by another original work of his Southern Muse. "Bonaventure" is worthy of Mr. Cable's renown, and will, it is to be expected, still more enlarge the circle of his readers.

GIRARD'S WILL AND GIRARD COLLEGE THEOLOGY. By Richard B. Westbrook, D. D., LL. D. Philadelphia: 1888. Published by the author.

The chapters which make up this book were originally delivered, in substance, as popular lectures in the last spring course of *The Westbrook Free Lectureship* in the hall of our City Institute, and attracted considerable public attention at that time. The author of this book is not unfriendly to the Bible or to Christianity but he believes that their greatest enemies are those who unwittingly claim for them what they are not. As a theologian and lawyer, he thoroughly believes that the present system of religious instruction in Girard College is in palpable violation of the conditions of the Will of the Founder, and not well adapted to promote "the purest principles of morality." In the different chapters, the case is stated and the defence of the directors examined. The question whether sectarian dogmas are essential to morality is thoroughly discussed, and Mr. Westbrook's answer is summed up in one sentence: "Ethical culture is what Girard College needs." The appendix contains all the main clauses of Girard's Will (in part) and the opinion of the Supreme Court given in 1844 in the Girard Will Case.

In the *Revue Philosophique* for May, 1888, M. A. Binet discusses the problem of the muscular sense according to recent investigations of hysteria. Mr. Binet's result is purely negative. The observation of hysteria-patients does not furnish us with any fact which irrevocably demonstrates the existence of a muscular sense, producing a sensation concomitant with the current in the motor nerves. M. Charles Richet contributes an essay on 'Psychic Reflexes.' Social questions are treated by M. Ch. Secrétan who presents the advantageous and disadvantageous aspects of a normal working day in his essay, *La Journée normale*.

## NOTES.

The Sunday lectures of the Ethical Society of Chicago closed on the 27th inst. Gen. M. M. Trumbull spoke upon 'The Celebration of Decoration day.' His address was so powerful that even men present had difficulty in restraining the tears in their eyes. But this would have been no criterion for commendation, if the address had not at the same time been entirely free from sentimentality. It was a sober expression of the ethical conception in the custom of decorating the graves of our veterans. When the general had finished, Mr. Salter addressed the audience. He spoke of the issues at stake in times of peace, and especially of present dangers, resulting from corruption and a lack of true public spirit. We hope that we shall be able to publish the important passages from it in full. They deserve the attention of all well-meaning citizens throughout the country.

## OBITUARY.

M. Guyau, the author of several works on moral and religious topics, died on the 31st of March last, in Menton, France. His last work *L'irreligion de l'avenir* produced a great sensation in France as well as abroad, and made him the object of many violent attacks. The death of this brilliant and gifted author was very premature. He died in his thirty-third year, yet the period of his life—although very short—was long enough to make his name famous throughout the literary world.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

## CHAPTER XVI.—Continued.

Laura hastened out to bring back the prisoner.

When the Magister entered, Frau Struvelius looked so imploringly at Ilse, that the latter made up her mind to carry on the negotiation.

"Magister, we have set our hearts upon having this bit of manuscript with which the professors have been so much occupied, and as you know about it, we request your help to obtain it."

A submissive smile played over the lips of Magister Knips.

"We wish to buy it," interposed Frau Struvelius; "and we beg of you to undertake the purchase. You shall have the money necessary for it."

Forgetting their agreement in her intense anxiety, she put her hand into her purse and counted one louis d'or after another on the table, till Laura sprang up, terrified, and tugged at her shawl from behind.

Knips again laid his head on his shoulder, and fixed his eyes upon the small fingers of the Professor's wife, from which fell one gold piece after another.

"This, and still more, shall be yours," cried Frau Struvelius, "if you will procure me the parchment."

The Magister fumbled in his pocket for his handkerchief, and wiped his forehead.

"It must be well known to the ladies," he said, plaintively, "that I have to read many proof-sheets, and to work late into the night before I can earn the tenth portion of what you lay before me. It is a great temptation to me; but I do not believe that I can obtain the strip of parchment; and if I should succeed, I fear it will only be upon the condition that it shall not get into the hands of any of the professors, but be destroyed here in your presence."

"Go out again, Magister Knips," cried Laura, springing up, "and leave your hat here that you may not escape us."

The Magister disappeared for the second time. Again the women put their heads together.

"He has the parchment, and he can produce it; we know that now," exclaimed Laura.

"We cannot agree to his offer," said Ilse. "It is not fitting for us to take possession of the parchment; it must be examined by our husbands, and then returned to the Magister."

"I beg of you to take away all this money," cried Laura, "and permit me now to adopt another tone with him, for my patience is at an end." She opened the door: "Come in, Magister Knips. Listen attentively to me. You have refused, and the money has disappeared, all but two pieces, which may still be yours; but only

on the condition that you procure for us at once what Frau Struvelius has begged of you. For we have clearly seen that you possess the strip, and if you still refuse we shall have cause to suspect that you have acted dishonorably in the matter."

Knips looked terrified, and raised his hands imploringly.

"I shall go directly," continued Laura, "to your mother, and tell her that there is an end to all connection between her and our house; and I shall go over to Herr Hahn, and tell him of your conduct, that he may set your brother at you. Your brother is in business, and knows what is upright; and if he does not see it in that light, Herr Hahn will, and that would not be to the advantage of your brother. Finally, I tell you further, I will at once send over for Fritz Hahn and tell him everything, and then he shall deal with you. Fritz Hahn will get the better of you, you know, and so do I, for he always did when we were children. I know you, Magister. We, in our street, are not the sort of people to allow ourselves to be hoodwinked, and we value good conduct in the neighborhood. Therefore, procure the parchment, or you shall know Laura Hummel."

Thus spoke Laura with flaming eyes, and clenching her little hand at the Magister. Ilse looked with astonishment at her determined friend.

If a discourse is to be judged by its effect, Laura's speech was a pattern, for it worked most disturbingly on the Magister. He had grown up among the people and customs of that little street, and could well appreciate the consequences which Laura's hostility would exercise on the needy circumstances of his private life. He, therefore, struggled for a time for words, and at last began, in a low voice:

"As even Miss Laura suspects me, I am undoubtedly compelled to tell how the affair stands. I know a small traveling peddler who carries about with him various antiquities—wood-cuts, miniatures, and also fragments of old manuscripts, and anything of the kind that comes in his way. I have frequently obtained him customers, and given him information upon the value of rare things. This man, during his stay here, showed me a collection of old parchment leaves, concerning which he was already, he said, in negotiation with a foreigner. Attention being drawn to the double writing on the leaves, the strip appeared noteworthy to him, and to me also. I read some of it, as far as could be made out through the paste that lay upon it; and I begged him at least to lend me the parchment that I might show it to our men of learning. I carried it to Professor Struvelius, and as he judged that it might perhaps be worth the trouble of examining, I went again to the dealer. He told me he would not sell the strip outright, but he should like something to be written concerning

it, as that would increase its value; and he delivered it into my hands till his return. This week he came again to take it away with him. I do not know whether it is still to be had, or whether he will take this money for it. I fear not."

The ladies looked at each other.

"You all hear this statement," began Frau Struvelius. "But why, Magister, did you beg my husband to tell no one that the parchment came from you?"

The Magister turned on his chair and again looked at his knees embarrassed.

"Ah, the lady will not be angry if I speak out. Professor Werner has always been very friendly to me, and I feared that he might take it amiss if I did not first show him such a discovery. But Professor Struvelius has also a claim to my gratitude, for he has graciously intrusted to me the proof-sheets and table of contents of his new great edition. I am, therefore, in fear of offending two valuable patrons."

This was unfortunate, certainly, and not improbable.

"Oh, do contrive that your husband may hear him," exclaimed Frau Struvelius.

"We hope, Magister, that you will repeat your words before others who can understand the import of them better than we do," said Ilse.

The Magister expressed his willingness timidly.

"But you must, nevertheless, procure the parchment," interposed Laura.

Knips shrugged his shoulders. "If it is possible," he said; "but I don't know whether the man will give it up for this sum."

Frau Struvelius was again putting her hand into her pocket; but Ilse held it back, and Laura cried out:

"We will give no more."

"Nevertheless," continued the Magister, impelled by the determination of his judges, "as doubts have been raised of its genuineness, the parchment may have lost some of its value for the dealer. But if I should succeed in being of service to you, I respectfully entreat you not to bear any malice against me for the unfortunate share which, without any fault on my part, I have had in this sad business. It has grieved me much the whole time; and since the criticism of Professor Werner has been printed, I have daily lamented that I ever set eyes on the parchment. I should sink into an abyss of misery if I were to lose my respected patrons."

These words excited the compassion of his judges, and Frau Struvelius said, kindly:

"We believe you, for it is a dreadful feeling to have deceived others, even unintentionally."

But Laura, who had established herself as president of the council, decided shortly:

"I beg that all who have taken part in this will meet here to-morrow at the same hour. I give you to that time, Magister Knips, to procure the parchment. After

the expiration of this respite our house will be closed to you, our washing withdrawn, and notice given to the Hahn family. See, therefore, that we come to an amicable settlement."

The Magister approached the table, with one finger drew the gold pieces into the palm of his hand, which he modestly held under the edge of the table, made three low bows, and took leave of the ladies.

Ilse related the adventure to her husband, and Felix listened with astonishment at the role which the learned factotum had played in the tragedy.

On the following morning the Magister made his appearance before the Professor. Breathless he drew out of his pocket the unfortunate strip of parchment, and carried it with bowed head and outstretched hand, bending lower and lower, humbly and imploringly, from the door to the writing-table of the Professor.

"I venture to bring this to you, rather than encounter the ladies for a second time. Perhaps you will graciously deign to deliver this through your wife into the hands of its new possessor."

When the Professor examined him severely, he began a statement in defense of himself. What he said was not improbable. The name of the doubtful trader was known to the Professor. He was aware that he had been staying in the town during the course of the last few weeks, and from the numerous communications that Knips had had with this man in the interest of his patrons, there was nothing extraordinary in their intimacy. The Professor examined the parchment carefully. If there had been a forgery here, it had been carried out in a masterly way; but Knips produced a microscope from his waistcoat pocket, and pointed out how, by means of the magnifying glass, one could discover that sometimes the shadowy characters of the apparently most ancient handwriting had been introduced *over* the words of the church prayers, and had therefore been painted on at a later period.

"Your strictures in the *Literary Gazette* drew my attention to this, and early this morning, when I obtained the parchment, I carefully examined what had been rendered indistinct by the paste. So far as I may be permitted to have a judgment in such things, I now venture to share your opinion that a forgery has been perpetrated on this strip."

The Professor threw it aside.

"I regret that you have ever had anything to do with it, even though unintentionally; you have done a mischief, the painful effects of which you cannot fail to see. I am sorry for it on your own account. This unfortunate occurrence will throw a shadow over your life; and I would give much to be able to wipe it away. For we have known one another through much mutual work, Magister, and I have always felt a sympathy in your self-sacrificing activity in favor of others. In spite

of your book-chaffering, which I do not approve of, and in spite of your waste of time in labors which might be done by less efficient persons, I have always considered you as a man whose extraordinary knowledge inspires respect."

The humble Magister raised his head, and a smile passed over his face.

"I have always, Professor, considered you as the only one, among my distinguished patrons, who has the right to tell me that I have learnt too little; you are also, Professor, the one to whom I venture to confess that I have secretly never ceased to esteem myself as a man of learning. I hope that you will not deny me the testimony that I have always been a trustworthy and faithful laborer in that cause."

He fell back into his humble attitude, as he continued:

"What has happened will be a lesson for me in future."

"I demand more of you. First, you must take the trouble of ascertaining through your acquaintance the hidden source from which this forgery has emanated, for it can scarcely be the accidental idea of an unscrupulous man; it is rather the work of an ill-directed industry, which in time will produce more evil. Further, it is your duty at once to deliver the parchment to Professor Struvelius, and impart to him your discovery. You yourself will do well to be more cautious in future in the choice of the traders with whom you deal."

In these views Knips fully acquiesced and departed, whilst he imploringly besought the kind consideration of the Professor for the future.

"He has, I am certain, to some extent been concerned in the knavery," exclaimed the Doctor.

"No," rejoined the Professor. "His fault has been, that up to the last moment he cared more for his bargain than for the discovery of the truth."

In the afternoon Frau Struvelius said to Ilse:

"What we have succeeded in obtaining has been very painful for my husband. For it has convinced him that he was deceived, while others discovered the true state of the case. It is a cruel grief to a wife when she is the instrument of bringing about such humiliation to him she loves best. This sorrow I shall long continue to feel. Besides this, our husbands are so estranged from one another, that a long time will elapse before their wounded feelings will admit of a reconciliation, or allow them to cherish for each other the respect which as colleagues they mutually owe. I hope, however, that the relations between you and me should not suffer. I have discovered the worth of your heart, and I beg of you—in spite of my unprepossessing manner, of which I am well aware—to accept the friendship which I feel for you."

As she walked slowly towards the door in her black

dress, Ilse looked after her with a feeling of surprise, that the first impression made upon her by the learned lady should have been so quickly obliterated by other feelings.

In the next number of the *Literary Gazette* there appeared a short explanation by Professor Struvelius, in which he honorably acknowledged that he had been deceived by undoubtedly a very expert deception, and that he must be grateful to the acuteness and friendly activity of his honored colleague who had contributed to the clearing up of the matter.

"This explanation has been written by his wife," said the obdurate Doctor.

"We may hope that the disagreeable affair has come to an end for all concerned in it," concluded the Professor, with a light heart.

But the hopes even of a great scholar are not always fulfilled. This quarrel of the scepter-bearing princes of the University had not only introduced Ilse into a new position, but had brought another into notice.

On the evening of the decisive day which revealed the worthlessness of the parchment, Magister Knips sat shivering upon the floor in the unwarmed room of his poverty-stricken dwelling. Books lay heaped up in disorder, on the shelves by the wall and on the floor, and he sat surrounded by them, like an ant-lion in his den. He removed into a dark corner an old cigar chest of his brother's, which was filled with many small bottles and paint-pots, and laid the old books upon it. Then he placed the lamp on a stool near him, and with secret satisfaction took up one old book after another, examined the binding, read the title and last page, stroked it caressingly with his hand, and then again laid it on the heap. At last he seized an old Italian edition of a Greek author with both hands, moved nearer to the lamp, and examined it leaf by leaf.

His mother called through the door:

"Leave your books and come from that cold room to your supper."

"This book has not been seen by any learned man for two hundred years. They deny, mother, that it is even existing; but I have it in my hands—it belongs to me! This is a treasure, mother."

"What good will your treasure do you, poor youth?"

"I have it, mother," said the Magister, looking up at the hard-featured woman, and his winking eyes glistened brightly. "To-day I have read some proof-sheets, in which a man of note maintains that this volume which I hold here has never existed. He wishes the 'never existed' to be printed in italics, and I have so marked it for the compositor, though I know better."

"Are you coming?" called out the mother, angrily. "Stop your work, your beer is getting flat."

The Magister rose unwillingly, slipped out of the room with his felt shoes, and seating himself at the table

helped himself to the scanty fare before him and without further ado began to eat.

"Mother," he said to the woman, who was watching his rapid meal, "I have some money remaining; if you want anything, buy it; but I will know how you spend it, and will see that my brother does not again borrow the money of you, for it has been earned by hard work."

"Your brother will now pay all back, for Hahn has improved his position, and he has a good income."

"That is not true," replied the Magister, looking sharply at his mother. "He has become too stylish to dwell with us now; but whenever he comes he always wants something of you, and you have always loved him more than me."

"Do not say so, my son," cried Frau Knips. "He is quite different; you are always industrious, quiet, and collected, and even as a small boy you began to save."

"I have obtained for myself what was dear to me," said the Magister, looking toward his room, "and I have found much."

"Ah, what hardships you suffer for it, my poor child!" said the mother coaxingly.

"I take things as they come," answered the Magister, making a cheerful grimace. "I read proof-sheets, and I do much work for these learned men, who drive in carriages like people of distinction, and when I come to them they treat me like a Roman slave. No man knows how often I correct their stupid blunders, and the bad errors in their Latin. But I do not do it for all—only for those who have deserved well of me. I let the mistakes of the others remain, and I shrug my shoulders secretly at their empty heads. All is not gold that glitters," he said, holding his thin beer complacently up to the light, "and I alone know the value of many. I am always correcting their miserable manuscripts, but do not correct their worst errors. I see how they torment themselves, and the little they do know they pilfer from other books. One sees that every day, mother, and one laughs in secret over the course of the world."

And Magister Knips laughed at the world.

(To be continued.)

## THE ANIMAL SOUL AND THE HUMAN SOUL.

BY CARUS STERNE.

Part II.

*Translated for THE OPEN COURT by vq.*

The intelligence of animals is often undervalued, as it is likewise frequently exaggerated. Hunters, bird-fanciers, and lovers of animals in general, are very apt to believe them possessed of remarkable mental capacity and of the control of important mental operations. They relate wonders of the cleverness of their pets, and often recount things which are utterly impossible to the so-called instinct of the lower animals. It is a very prevalent idea that many animals, especially insects,—as for instance the wood-worm,—will feign death when in danger, because they know that they are then less easily seen, or, that their enemies do not eat dead animals. How absurd it is to presuppose that such a tiny creature possesses the subtle thoughts of a Falstaff, or to imagine, as hunters do, that a partridge or any swamp-bird will pretend to be unable to fly in order to lure the hunter away from its nest. The celebrated physiologist Preyer, of Jena, has shown that this "feigning" is in fact a complete or a partial paralysis, caused by fear, and is really a very passive property, which man possesses in common with most animals. But, because these paralyzes are most useful in saving animals from their enemies, it has been developed in them to such a degree that it appears to us to be deep scheming and at times even the acme of heroism; yet such supposed marks of mental capacity are simply out of the question.

This supposed "death-feint" of animals is a good example of the manner in which we can imagine instinct to originate. In certain species, only such animals as were rendered perfectly motionless by fear, had any chance of surviving the others, and so this quality was strengthened by heredity; and similarly actions which insured the perpetuity of the species, became habitual to all animals. Instinctive actions, then, are those which are not the result of reflexion,—as a man in falling does not study about extending his arms;—they are impulses innate, not only in the individual, but in the species, and they are exercised without requiring any knowledge of their consequences on the part of the animal. Thus we often meet with the oddest acquirements in the form of instincts.

The ancient classical authors, and especially those who have told us many anecdotes of animals, like Ælianus, Pliny, and others, contain innumerable stories which tell us that sick animals know very well how to find suitable remedies in the animal or vegetable kingdom, and that in this respect, as in many others, they have been the teachers of man. Instead of repeating all the numerous examples to be found in the above-mentioned authors and which, strange to say, are usually accredited to Aristotle, we will here cite the comprehensive description which Plutarch has given of the animal sanative instincts in his excellent dissertation: "Are land or water-animals the wisest?"

"Democritus," he says, "teaches us that even in the most important subjects we have been the pupils of animals; for instance, in spinning and sewing we have learned from the spider, in building, from the swallow, and in singing, from the singing-birds. We even find among them distinct traces of the three different branches of the art of healing (medicine, dietetics, and surgery). In the first place they know how to heal internal diseases by means of herbs, etc. The turtle will immediately resort to the use of hemp-agrimony and the weasel to Syrian rue if they chance to have eaten part of a snake. Dogs cure themselves of the jaundice with a certain purging herb. The snake rubs its bedimmed eyes against the fennel-plant, and thus partly restores them. The bear, upon leaving his den, eats first of all of the wild arum, which clears the shrunken viscera. If he feels unwell, he will go to an ant-hill, stir it up, and, seating himself beside it, will extend his tongue, which is coated with a sweet, sticky juice, until it becomes covered with ants, these he swallows, and the effect is very healing to him. The Egyptians are said to have learned the use of the clyster from the Ibis, which purges itself by the injection of sea-water; and their priests use as holy water only that from which an Ibis has drunk, because this bird will not use impure or unwholesome water. Some animals cure themselves by abstaining from food altogether, as wolves and lions for instance, who, when they are tired of meat or oversatiated, lie still and try only to keep warm."

In these tales truth and fiction evidently mingle. Still some statements, such as the account of the strict diet which sick animals impose upon themselves, will

be confirmed by every observer of animal habits. But most people will consider the accounts of the knowledge and the use of medicinal plants among animals, in the light of fables, and the author himself was formerly of this way of thinking. It is certainly remarkable that Aristotle, who is known to have been such a close observer of animal life, emphatically repeats similar tales. Now it happens that some time ago I noticed a case which appeared to me to be a proof of such a wonderful sanative instinct that I will cite it here.

In my household a number of the blossom-laden branches of the wormwood had been plucked to dry for kitchen use. A number of little twigs and blossoms had fallen to the floor, and I noticed to my surprise that my little dog eagerly sought and ate them. Soon after he seemed to feel uncomfortable and discharged an excretion of an extremely bad odor, containing many parts of a tape-worm. I knew that this dog, like most dogs, suffered from a tape-worm (*Taenia serrata*) but I did not know that wormwood was a remedy for it, and moreover one of which the dog appeared to know. The next day, I mixed a quantity of the blossoms with his food and, despite the strong odor, he ate them eagerly, and again excreted portions of the tape-worm. Consequently, I do not doubt but that this or other species of worm-wood, is the plant mentioned by Aristotle, Elianus, and Plutarch, as the one with which dogs purge themselves; and as most of the *genus artemisia* are worm-expelling, it is probable that these animals relieve their habitual suffering by eating of this plant which grows by the road-sides and near manure and rubbish heaps.

"What is the reason that animals afflicted by disease eagerly seek means of relief and by their use are oftentimes cured?" Thus this same Plutarch has headed a chapter in his "Questions on Subjects of Natural Science," and he answers it as follows:

"...All these remedies became known to animals neither by experience nor by accident. Are we to believe that as the bee is attracted to honey and the vulture to carrion by the odor, so hemp-agrimony attracts the turtle, and the ant-hills attract the bear by emitting odors and exhalations suitable to their condition, without an anticipation on the part of the animal of the benefit to be derived therefrom? Or is the appetite of animals influenced in every instance by the existing combination of the moistures of the body, the union of which creates the various sweet and acid juices as well as other strange and harmful elements, thus provoking sickness? We see this in women who in certain conditions have a craving for earth and stones and eat them."

Plutarch decides in favor of the latter assumption and I have not heard any better explanation offered by more modern authors. What G. Jaeger has said more recently about the instincts of food, lust, and nausea,

in my opinion, amounts to the same thing. Any one who has ever witnessed the impetuous haste with which the Alpine herds press forward to be "salted," and who remembers how little he himself likes unsalted food, will understand this and similar explanations of the necessities of food. And why, besides ordinary hunger and thirst, may there not also be physiological shades of appetite for alkaloids, acids, spices, narcotics, salt, etc.? Still, it is more difficult to believe that a certain disease, as the tape-worm in our example, provokes a peculiar appetite, which suggests the search for healing remedies. It appears to me that another, viz., the Darwinian, explanation of instinct is preferable. We must assume that beasts of prey, who live almost exclusively on raw meat, possess some habit which enables them to make the parasites often contained in the meat harmless, or, at least, to keep them in check. We might therefore believe that those species which had contracted the habit of occasionally purging themselves by means of certain herbs, had become stronger and more capable of resistance than others, and had survived these, and that the predilection for wormwood exhibited by my dog, is an hereditary habit peculiar to the race. Regarded from this stand-point the question seems to be very plausible, and in this connection it would be very interesting to learn whether the beasts of prey in Zoological Gardens, not being free to choose their food, are greater victims to the worm-pest than dogs, and in the latter case, whether chained dogs are more troubled than those at liberty?

Among the higher animals, all such instincts may be consciously exercised, that is to say, the animals may know what they are doing, but not, why they do it. We must remember that in man also, there are similar coercing impulses still extant, the object of which we know, but which we would obey just the same if we did not know their purpose; for instance, to mention the two earliest and strongest: the instincts of love and hunger. It is said that we eat to become satiated, but satiety is far from being an agreeable feeling; the fact is, we eat because our nature impels us to do so, and the satisfaction of this impulse produces pleasant sensations. We need not expatiate upon the other of the fundamental impulses,—everyone knows it from personal experience. Instinct in man embraces whatsoever concerns the fundamental conditions of the preservation of life. And does this not also apply to the social instinct and the consequent social virtues? Does not man possess them in common with animals although naturally in a more advanced state of development? Animals, too, vary greatly in point of mental endowments; those that live socially, like the ants, were able to raise themselves far above their level, while the beasts of prey, by their superior cunning, could outwit their herbivorous relations. We may as-

sume with much certainty, that the lowest classes of animals, just like the plants which twist and turn to the sun and are able to find their nourishment in the ground, are utterly devoid of consciousness. Of their senses there has perhaps been only a general sense developed, which enables them to distinguish the nutritive ingredients in surrounding objects. Even among some of the higher animals these two chemical senses of taste and smell are the factors of existence; eyes and ears appear to be altogether superfluous to the lowest animals; their existence seems to depend entirely upon hereditary instinct.

Beside these hereditary habits which require no manifestation of consciousness and of which the single actions, like reflex motions, are determined by external influences, there arises in time a consciousness which enables animals to ignore the set ways of their ancestors and, considering each special case, to suit their actions to existing circumstances. Recollection and personal experience are gradually added, loosening the bonds which had heretofore bound their movements and encroaching more and more upon the dominion of instinct. The higher animals receive a sort of juvenile education from their parents, and from the manner in which they are fed and nursed, they develop unmistakable signs of intelligence. They acquire the capacity to imitate, to learn and to reflect. The freedom of the will which appears to me to be a privilege especially accorded to human beings, has in animals, though still greatly suppressed by imperative instincts and impulses, nevertheless already freed itself in great measure from the shackles of absolute and arbitrary instinct, and we know that in certain cases we can train animals to resist even the strongest impulses. A new coercive force has simply taken the place of the dominant natural instinct,—such a force as the fear or love of man,—yet the old bond is broken.

What specific distinction may remain, then, between the intelligence of higher animals and that of man, is as difficult to determine with certainty as it is to clearly define it. Probably the eminent Italian psychologist, Tito Vignoli, in his work on the "Fundamental Law of Intelligence in the Animal-Kingdom," was correct in assuming that the mental process is essentially the same in the higher animals as it is in man, only that the former lack the power of inner reflection about their reflections, or that quality which we usually distinguish from consciousness by the term self-consciousness. Animals make observations with the senses sometimes far more acute than ours; they arrive at conclusions; they recollect things that are past, but all these acts are induced by internal and external processes which are not under the influence of the will; they cannot guide their processes; they

cannot analyze them, or voluntarily evoke them, or compare them with each other; all this would presuppose a mental self-observation, a double intellect, as already designated by the ancient phrase *homo duplex*. For instance, a dog dreams just as a man does; yes, by the continued use of absinthe he can be brought into a condition analogous to that of delirium tremens, in which he madly barks and snaps at the phantoms of his diseased brain, but he will never learn to distinguish the dream from the reality and recognize that they are but fever phantoms; which man, to a certain extent, is capable of doing. If we have arrived at this point, we can imagine the human mind to have grown out of that of the animal, and to the philologist the vehicle of this evolution has long been an open secret; intelligence has grown with the development of language, which has made it possible for man to formulate abstract ideas and thus to acquire self-consciousness; even at the present day there are peoples whose language and intelligence remain alike poor in abstract ideas.

#### RUSSIA AND THE EVANGELIC ALLIANCE.

BY THEODORE STANTON.

The Evangelic Alliance, says the *Journal de Genève*, has always considered that one of its first duties was to defend liberty of conscience and worship wherever threatened. Consequently, at the meeting of the delegates of the Alliance held at Geneva in August, 1886, for the purpose of constituting an International Committee, it was decided to send an Address to the Emperor of Russia, calling his attention to the violation of the principles of religious liberty in the Baltic Provinces.

This Address was drawn up by the Geneva Committee and signed by the principal members of the Alliance in Europe and America. In the United States it was signed by William E. Dodge, President of the American branch; Dr. Philip Schoff, Hon. Secretary; and Josiah Strong, General Secretary. Among other well-known names affixed to the document were Count von Bernstorff, of Germany; Lieut. Gen. Field, C. B., of England; Baron van Wassenar van Catwijck and Count van Bylandt, both of Holland.

During the visit of the Czar to Copenhagen last August a deputation of the Alliance composed of Count de St. George, member of the Geneva Committee, and Colonel Nepveu, delegate of the Dutch branch, presented this Address. Thereupon the President of the Holy Synod, M. Pobedonoszew, was charged by the Emperor to reply to the communication of the Alliance. This reply has now been made public, and I give below the principal passages of this long and important document.

"Nowhere else in Europe," writes M. Pobedon-

oszew, who may be called the Minister of Public Worship, "do heterodox confessions, and even those that are not Christian, enjoy such perfect liberty as in Russia, whose people, by their very nature, entertain the highest respect for every religious faith. But unfortunately Europe will not believe the truth of what I state. Why? Simply because outside of Russia religious liberty means the right of unlimited propagandism, whilst in Russia there are laws which punish those who leave our faith or who strive to make conversions to the detriment of orthodoxy. Europe pretends to see in these laws for the protection of the dominant church against the attacks of its enemies, religious persecution. But nothing of the kind exists.

"What saved Russia in the midst of the political and religious conflicts that have deluged Europe was the complete independence of its primordial forces, the immutability and energy of its national spirit, nourished in the faith of the Orthodox Church. I repeat that the vital principle to which Russia owes her salvation was found in orthodoxy. With this faith the nation has developed. This it is that has rendered Russia strong enough to accomplish her grand mission for the good of humanity. To protect the orthodox church against everything that threatens its security, is the sacred duty taught by our history, and on which depends its very existence.

"At the earliest stage of this religious and national development, Russia was brought into contact with the religions of the West. The Crusades, the conquest of Byzantium and the debasement of the Eastern church showed us that the religious aspirations of Western Europe were deeply penetrated by political passions and that the spirit of tolerance was foreign to them.

"Then came the Wars of Religion, with their passions and hatreds. States fell and rose. New confederations were formed, new nationalities appeared on the scene. Political ambition was rife. At this moment, when politics and religion were inextricably mingled, the two grand confessions of the West appeared simultaneously in Russia.

"Catholicism chose for its field of operations the Provinces of the West. Unfortunately it appeared among us identified with the Polish conflict. It began an implacable war on our orthodox church and strove to exterminate everything Russian and to transplant it by what was Polish. Under the banner of Catholicism, the armies of Poland penetrated more than once to the very heart of Russia. At the present day even, it is impossible to point to a single spot in Russia where Catholicism acts in a neutral spirit, where it is tolerant and not animated by a sentiment of animosity for the orthodox element, and filled with a desire to detach from Russia the thoroughly Russian Provinces on the western frontier.

"Unfortunately it was under almost similar conditions that Russia was brought face to face with Lutheranism in the person of the ancient Knights of the Teutonic Order, who barred her way to the Baltic sea. Destroying everything that could recall Catholicism, these new converts to Lutheranism, barons and clergymen, clung to all the temporal advantages that came to them from the old church. With all the energy of their race, they followed in the footsteps of their predecessors, exercising an arbitrary authority in the country, exciting the Letish and Finnish population against Russia, and condemning orthodoxy as the symbol of unity with Russia. And this old struggle is still going on, a struggle for the complete control of the country, led by the descendants of those ancient knights.

"Lutheranism, like Catholicism which it supplanted in those Provinces, uses religion as a mask with which to conceal its political aims. It does all in its power to put obstacles in the way of a closer union of the natives with the mother country, violating liberty of conscience, and at the same time complaining because it is not allowed to carry its spirit of propagandism beyond legal limits. It fills Europe with its complaints, while engaged in disturbing the most peaceful Lutheran Communities of the other parts of the Empire. If Protestant Europe would refuse to be influenced by the complaints and exaggerations of these intriguers, if it would look at the situation which really exists, it would see the formidable difficulties that lie in the way of him who would pass freely from the Lutheran to our Orthodox Church, and would perceive that in this hard struggle our efforts are not directed against Lutheranism but, quite the contrary, are concentrated in the defense of our church against the attacks of Lutheranism.

"The hour has not yet come, however much the true Christian may regret the fact, for the pacific fusion of the Western and Eastern churches. Here in Russia the confessions of the West are far from having abandoned their dominating pretensions and are ever ready not only to weaken the influence but to attack the very unity of our country. Russia cannot permit this kind of liberty. She will never suffer her children to be drawn away from the orthodox church and enrolled in a foreign sect, still in arms against the Russian nation. This is declared openly in her laws, and for our justification in this course we call upon Him who rules the destinies of Empires.

"Occidental Europe proclaims liberty of propaganda for all sects, but does not protect the dominant religion, the State church. Here in Russia we have followed the contrary course. But you who find fault with us, have you succeeded in guaranteeing liberty of conscience to all sects, in causing them to live side

by side in peace, and in banishing from their minds all desire of domination? Alas, no. This perfect liberty is enjoyed only by those who have passed from faith to incredulity."

The *Journal de Genève*, the leading daily of Switzerland, in commenting on the foregoing document, says:

"It should be borne in mind that this Response has almost as much weight with the orthodox church of Russia as the decision of a Council or the Pope speaking *ex cathedra* has with the Catholic Church. It amounts, therefore, to an official and solemn *non possumus*."

"On the left bank of the Vistula, therefore, liberty of conscience consists not only in the free exercise by every one of the religion in which he is born, but in the right of changing it for another when he has ceased to believe in it; and furthermore, in permitting a man to propagate his favorite belief with pen and word of mouth. On the right bank, however, freedom of worship is limited to defending against every intellectual and moral danger, the dominant religion, which being the only true one alone has the right to exist, the others being tolerated as sin is tolerated, because it cannot be eradicated. And this defense of the State church is not limited to a prohibition of every propagandist movement. It declares that an orthodox may not change his religion, even if he has ceased to believe; it even goes further and threatens the backslider with severe punishment if he attempts to return to the faith of his Protestant or Catholic ancestors, from whom he may have been separated against his will."

"Such is the appalling doctrine propounded by M. Pobedonoszew with a *naïveté*, an authority, and an unction in which irony is mingled. It reads like an expression of contempt for all our Western ideas. In a word, it is religious absolutism in all its rigor that characterizes this strange document. God save Europe from ever comprehending liberty of conscience after the manner of M. Pobedonoszew."

The St. Petersburg correspondant of the *Paris Temps* refers as follows, in his last letter, to this same extraordinary document:

"This *exposé* of views is particularly interesting at this moment when Russia and the Vatican are in the midst of negotiations. It is evident from this document that the Russian Government, in exchange for certain concessions concerning the autonomy of Catholic worship, will expect the Pope to exercise a strong influence on the Catholic clergy in the Western Provinces of Russia, so that they will separate their spiritual interest from those of a political nature, fostered by the ardent advocates of Polish nationality."

PARIS, April, 1888.

## THE INDIVIDUALITY\* OF ATOMS AND MOLECULES.

BY REV. H. H. HIGGINS, M.A.

### ATOMS.

The tendency of chemical research since the commencement of the present century has been to confirm the objective reality of these minute hypothetical forms. Atoms are not now regarded as indefinitely small; their diameters have been estimated and the number of atoms which would fill a box of measurable size has been computed. All atoms *may* be reducible to some ultimate principle; but atoms have never been divided, and the atom of a chemical formula is a distinct individual, which, as such, differs from an atom of a like kind; whilst it also differs, after another fashion—*i. e.*, in its idiosyncrasy—from the atom of a distinct elementary substance.

What constitutes the idiosyncrasy of an atom?

Let us begin with the best established of its qualities—weight. Why should an atom of oxygen be about sixteen times heavier than an atom of hydrogen, the size, or volume, being much the same? Gravitation is a mystery which is not solved when for attraction, which is declared to be inconceivable between bodies unconnected by any medium, is substituted the *vis a tergo* influence, which some regard as possible through the agency of the ether. Perhaps so, but what does either attraction or the ether find whereon to lay a strong hand on one atom, but a light hand only on an atom of a different kind? This question has not been answered; no one has ever seen or handled an atom, much less investigated its contents. The hypothetical nature of the atom has hitherto discouraged enquiry, but a higher confidence in its objective reality has now removed the atom from the sphere of ideality to that of the physical cosmos.

That it is too small to be recognized by our organs of sight does not render it infra-natural. We are satisfied that an atom occupies space to the exclusion of all other ponderable matter; that an atom in motion will continue to move with uniform velocity and direction till acted upon from without; in short, that an atom is a body, and is subject to the natural laws which govern other ponderable bodies. But an atom is more than a body. It is not merely a very small bit, or a least possible corner. It has singleness and completeness. It is an individual that cannot be added to, or diminished, or changed in shape or volume in any way, without affecting its identity.

To speak of an atom as if it were a glass ball, we might say that it cannot be broken or chipped, compressed or scratched; that no dust can settle on it, for the particles of dust are small masses consisting of

\* No exhaustive definition of "Individuality" has hitherto been found: but, at all events, it implies a certain amount of singleness and completeness in the object of which it is a character.

myriads of atoms. An atom is, in fact, the most perfect, perhaps the only quite perfect, individual. Whatever it has is its own with an entirety which can in no other case be predicated, and its idiosyncrasy, which is the sum of its properties as an individual, must include something that is *sui generis*.

There are supposed to be about seventy elementary substances, and, if so, there cannot be a less number of distinct simple atoms.

Upon the properties, combinations, affinities, and motions of these bodies, men, distinguished by their penetrating intellects, have been engaged in all quarters of the world for the last half century.

The result has been a course of observation and discovery, which has achieved the almost incredible feat of securing for the science of matter a progress *pari passu* with that of the science of biology, reconstructed and invigorated by the genius of Darwin.

It must be admitted that chemistry, as represented by its libraries of scientific treatises, its renovated nomenclature, its astonishing system of symbols and its vast industrial products, exhibits a triumph of that kind of knowledge which is verifiable by experiment, a knowledge to which some would restrict the name of science.

Hence, the general elimination, from chemical works, of philosophical enquiries and considerations not obviously tending to increase the number of ascertained verifiable facts pertaining to chemical science.

For example, the enquiry, if an atom be an individual and possess a true idiosyncrasy—in what relation does it stand, as an individual, to another individual—*e. g.*, an atom, or an animalcule, or a whale?

It has been already suggested that the relation between individuals rests upon each having a completeness of its own. A mere bit of matter, as a lump of sugar, can have no such relation with another bit.

Now, therefore, we have entered upon a category of enquiries differing from ordinary chemical investigations in not anticipating solution or verification by experiment.

What, we may ask, is the atom's place in Nature? It is hard to conceive anything like an atom within the realm of psychology, or in electricity, or in light, or in any of its correlatives, or in the ether. The rest of Nature, however, seems to be made up of atoms. Not indeed of simple atoms, but of these, and of atoms in combination, forming molecules, which also have individuality and idiosyncrasy pertaining to them as to the atoms. So long as the term atom was a mere hypothetical convenience, it was unprofitable to enquire for any significance in the atomic constitution of the matter of the universe.

It need not be so now; for the atom is to us the ultimate form of matter, and it is understood that neither the electric spark, nor a heat immensely greater than that of the sun has been known to disintegrate an atom. It is probable then that the atoms have always obeyed the laws of matter and of motion, so that if we look back to a period ever so remote, our retrospect does not lead to a condition of chaos or to the fortuitous wanderings of atoms, but rather to a condition of order and obedience to law.

Moreover, whilst the course of ages has witnessed higher and yet higher forms of differentiation, our earliest horizon can show nothing of homogeneity, or of any approach to it, but, on the contrary, from the very outset it shows an innumerable multiplicity of individuals of a few kinds, endued with properties, qualities, and capacities which they possess still. As the term "homogeneous" has, on high authority, been applied to the primal condition of matter, it may be well to point out that, if atoms have the individuality indicated by the discoveries of Mendelejeff and other chemists, the nearest approach of matter to homogeneity, has been no closer than may be illustrated by the contents of a bag of shot, or of a vessel of water, which is, in fact, no approach at all.

Something of this kind of answer seems to be suggested by the present state of knowledge in reply to the enquiry—What is the atom's place in Nature?

We may now pass on to another part of the same question—How does one atom differ from another?

Sir Henry Roscoe, in his Manchester address to the British Association, states that the weights of the atoms of the elements approximate so closely to multiples of the weight of the hydrogen atom that some reason must exist for the coincidence, which is only short of absolute accuracy.

To myself, that for more than thirty years have noticed and contemplated similar infinitesimal discrepancies, this is extremely interesting, because it illustrates a frequent tendency in natural laws and relations, when under exhaustive examination, to disclose residuary unconformable phenomena.

The President of the British Association regards the hydrogen discrepancy as an occult but fundamental question of atomic philosophy, at present behind the veil, but, he doubts not, at no distant period to be brought into the clear light of day.

The President's confidence might be shared more readily if his difficulty stood alone. It is, however, I think, not too much to say that the approximate character of many natural laws, discovered only through matured knowledge, cannot be a matter of chance, but that some reason must exist for it, which reason may continue to operate in future, not to shake our confidence in the reality and stability of natural laws, but

to prevent our knowledge of them, *at any given age*, assuming a dogmatic form.

The introduction of a new element, Helium =  $\frac{u}{2}$ , would perhaps serve a purpose in certain instances, but might probably render a number of other adjustments necessary. Sir H. Roscoe regards the incommensurability as so minute as to be only short of absolute accuracy. Now  $\frac{u}{2}$  would only exactly serve to fit a discrepancy where the difference was not less than  $\frac{0}{32}$ , which cannot be regarded as pertaining to a high degree of approximation.

#### MOLECULES.

In passing from the atom's place in Nature to consider the relations subsisting between one atom and another, or several others, within the sphere of mutual and reciprocal action, our thoughts must still be directed in pursuit, not of phenomena, but of reasonable and philosophical inferences, based on verifiable facts.

The present subject is, however, vastly more comprehensive than the former. The kinds of atoms may constitute a series of about seventy terms; but the combinations of atoms in forming molecules are almost innumerable.

A molecule is defined to be the smallest particle of any substance capable of existing in a free state. It is evident, therefore, that in an elementary substance the molecule may be represented by the atom. But the molecule implies combination and liability to decomposition, and in these respects it differs from an atom.

What, then, happens when atoms combine to form a molecule; *e.g.*, when two atoms of H unite with one atom of O, to form a molecule of water,  $H_2O$ ?

The atom of O possesses its idiosyncrasy under a new phase. It is no longer a disengaged O atom. Part of its capacity is satiated by union with the H double atom. It has, however, not altogether lost its properties, for it retains a strong affinity for the other elements, *e.g.*, the metal potassium, for the sake of which the O in the molecule of water will forsake the H, decomposing the water.

The atoms of O and of H can, moreover, be recovered from water by electrolysis.

In the synthesis of water, therefore, atomic individuals of two kinds have partially lost their characters, and a molecule has arisen possessing a true idiosyncrasy, derived in some occult manner from the properties of the constituent atoms, which, however, are not entirely used up in forming the  $H_2O$  molecule.

The properties of water must be regarded as altogether depending upon the idiosyncrasy of its molecule. But the properties of the molecule are not primordial, as in the atom—they are derived. When, therefore, we regard the crystalline forms assumed by water, its freezing and boiling points, its weight, its

remarkable specific heat, its curious property of suddenly expanding before reaching the freezing temperature—a peculiarity without which the world would soon be as lifeless as the moon—our sense of causality requires that we should seek their antecedents somewhere far back in the O and H atoms.\*

An ordinary investigation into the idiosyncrasy of the O atom will convince us that its capacity for combination with other atoms is very great; there are few kinds of atoms, I believe only one, *viz.*, fluorine, with which it is not ready to unite in various proportions. Such combinations are said to be the result of *chemism*, or chemical affinity, a force which is declared to be of the same nature with mechanical force. To speak more accurately, some who admit chemical affinity to be still obscure, assert that the tendency of modern discoveries is to indicate that chemical affinity is mechanical in its character.

I shall endeavor to show that this is true only in the same sense with the assertion that modern discoveries point to the primal condition of the universe as being homogeneous, a misconception with which we have already dealt.

To begin, then, with examining the results of chemical affinity. The process of chemical combination takes place under our own observation. We can construct  $H_2O$ , the molecule of water, and have something to say on the operation. After combination, the oxygen is still there in some sense, and the hydrogen is still there in some sense, but from their union has sprung a foreign individual,  $H_2O$ , marvelously distinct from either. It has certain of the qualities of its antecedents, such as weight and extent, but therewith a set of entirely new properties, together constituting the idiosyncrasy of a distinct individual,  $H_2O$ .

Now to affirm that the process by which this is effected is mechanical is, I think, to misrepresent the limits of mechanical efficiency. It is unworthy of serious enquiry to say—Why, what else can it be? Mechanics is the science of motion, and is not chemical combination a case of motion?

We are now at the very nucleus of our question, and desire to be specially on our guard against, and to keep others from, playing fast and loose with the meanings of terms.

The laws of motion and of mechanics are uniform and simple.

It may be said that "*molecular mechanics*" are intended—something quite distinct from the ordinary mechanics of masses.

Such a statement may be responsible for any amount of error, for, so, molecular mechanics would be the science of an unknown agency called into existence for the purpose tiding over a difficulty.

\* *Nihil in moleculis quod non prius erat in atomis.*

Now, in the dynamics of gaseous particles, the principles of mechanics are gloriously applied to solve wondrous problems, but the beauty of the solution lies in its being obtained by the recognized laws, and not by a new science such as that of molecular mechanics, created *pro re nata*. To be able to account for the pressure on the side of a vessel, due to the motions of gaseous particles, is legitimate mechanics, but the problem is something very different from that we have had to deal with in the process of the nascent individual, when  $H_2$  combines with O to form a molecule of water.

No parallel to this, in law or sequence, can be found anywhere in Nature, except on the same lines, namely, of atoms combining to form molecules. But, I think, it is impossible not to be reminded of operations which everywhere, and at all times, prevail in the presence of organic life.

For example, the fertilization of an ovum, wherein two elements combine, each of which is a distinct individual, having an idiosyncrasy of its own, the result being amazingly different from either. Thus it is with the incipient molecule. No one questions that the phenomena of fertilization are dependent upon the presence of life; it may, at least, be possible that the generation of a molecule from two or more atoms may equally be dependent on some form of life, or its equivalent.

In this way we are led to the hypothesis of the existence in the atom of a property resembling life, whatever life may be. I do not pretend to be able to explain life; but I believe it to be grossly unscientific to define life as if, exhaustively, it were the product of *known* laws regulating matter in motion. I do not look upon life as miraculous, but as involving laws other than we know at present.

I am well aware that this is no new position. James Hinton, one of the most profoundly thoughtful men that Liverpool has numbered amongst her citizens, takes up inorganic life strongly in his work entitled *Life in Nature*; but the individuality of atoms was unknown to him.

As a philosophical deduction, the universality of life has been held from ancient times, but it has never advanced beyond a limited acceptance as a speculative conception.

If it now occupy a vantage ground, it is, I believe, almost entirely through the prominence given to the individuality of the atom.

I trust I may be pardoned the introduction of a brief episode relating to my own progress in accepting the proposition I am bringing before you in this paper.

Having been for many years a student of James ton's works, nothing held by him was indifferent

to me. I wished, if possible, to agree with him in beholding life everywhere, and to some extent I did so; but notwithstanding the beauty of the atomic theory, the atoms were a difficulty to me. As representing the elementary condition of matter, the atoms seemed to be deficient in order.

Homogeneousness has always been most repulsive to me, as being a cloud out of which nothing could escape or be developed. But why need I dwell on the deficiencies of atoms? All that seemed to be required of order and individuality has been shown to belong to them by that inexpressibly astonishing law of their periodicity, discovered by Newlands, and prosecuted by Mendeleeff.

The seventy atoms classified on a natural system, founded on all the observable properties of each atom, are understood to form an ascending series like the rungs of a ladder; he grades in which are so uniform that gaps in the series were detected, and led to the prediction and ultimate discovery of the new elements, Gallium, Scandium, and Germanium.

I have regarded this as the greatest of all discoveries for the following reason. Other laws illustrate order where order was previously presumed to exist; but this brings order down to the ultimate condition of matter, where, at all events, the presumption of order was not strong enough to resist the barbarous invasion of the doctrine of homogeneity.

After the establishment of Mendeleeff's law, the recognition of some equivalent to life in the atom became inevitable, and its acceptance is, I think, only a matter of time.

If thus much be admitted, the existence of a common base of all the atoms becomes more probable; but it has not yet been shown.

By what name shall we designate this supposed life without protoplasm—this vital principle of an atom?

In the case of a microscopic organism, known as a Radiolarian, Haeckel proposes the term *Zell-seele*, or cell-soul, for the vital principle of his unicellular animalcule, or protozoon, and regards the cell-soul as the "unit regulating the animal and vegetal functions of the organism, and the special organ of reproduction and inheritance." Not a little astonishing, certainly, considering his former impetuous protests against vitality; but we may gladly let by-gones be by-gones.

I should prefer the term life-unit, but it is cumbersome, and I propose to use the term *bios*; premising that in an atom the *bios* is intended to denote that primordial potency by virtue of which the atom possesses and exercises elective affinity, and whatever else may unite to make up its idiosyncrasy as an individual.

(To be continued.)

## SONNET.

LOUIS BELROSE, JR.

The sweetest visions haunt me ever,  
 When no word's nigh;  
 The fairest thought escapes endeavor,  
 Born but to die.

Like hearts the weary wide waves sever,  
 That ache and sigh,  
 So year my thought and word, but never  
 Find wings to fly.

Yon birds that keep the wild wood ringing  
 All day long,  
 Are joyous, each emotion bringing  
 Notes as strong.

Ah, would that I had voice for singing  
 My whole soul's song.

## BOOK REVIEWS.

A STUDY OF RELIGION, ITS SOURCES AND CONTENTS. By *Frédéric Martineau*, D. D., LL. D. Oxford: 1888. At the Clarendon Press. New York: 1888. MacMillan & Co.

The author of this work need not be praised, for he is sufficiently known as a scholar and a thinker. Martineau's "Study of Religion" may be considered as the ablest and most comprehensive exposition of Unitarian Christianity. It is the fruit of the author's maturer years and contains the main results of the inquiries and thoughts of a long and rich life.

If we disagree with the author—and we do disagree with him in most essential topics—it is with due regard for the man. A complete statement of our disagreements cannot be laid down in the narrow limits of a review and we must therefore at present confine ourselves to a few points.

We disagree from the beginning with the author when he understands by Religion "belief in an Ever-living God, that is, of a Divine Mind and Will ruling the Universe and holding Moral relations with mankind."

This means more popularly expressed: Religion is the belief in a personal God. Any religion that depends upon belief is dogmatic. And if religion cannot be built upon facts which can be proven by science, its whole system rests on sand. Religion, as we take it, is a fact of human nature; it is based upon the necessity of the individual to hold moral relations with the rest of the world especially with mankind. The irreligious person is he who has cut himself loose from the responsibility implied by such relations, but not he who rejects a belief, be it in a personal Deity or be it a belief of any other kind.

Professor Martineau, it must be confessed, is very liberal as a theologian, but he has not yet freed himself from the prejudices of supernaturalism. He does not yet see that for a consistent scientific reasoning he must drop his dualistic views of a transcendental mind and of absolute and eternal consciousness. Both ideas are intimately interwoven with his conceptions of God and immortality.

Mr. Spencer's view of the Unknowable is well objected to on pp. 131 and 132: "Wherever I can distinguish, there I know; and do I not distinguish this 'absolute' from all that is related to it, and thus get it, as counter term, into relative apprehension? Is it not, among noumena, different from Space, from Time, from Substance? If I can say all these things about it, it is no longer competent to me to designate it as the absolutely Unknowable. To know that an object *is*, yet know nothing that it *has*, is impossible,

because contradictory. This negative Ontology therefore, which identifies 'the supreme reality' with total vacuity, and makes the infinite in Being the zero in thought, cannot permanently poise itself in its precarious position: it must either repent of its concessions to realism (which it is too philosophical to do), and lapse into the Scientific commonplace 'all we know is phenomena'; or else advance, with what caution and reserve it pleases, into ulterior conceptions of the invisible cause, sufficient to soften the total eclipse into the penumbra of a sacred mystery."

The 'commonplace' of Science is certainly a firmer ground for religion to build upon, than 'the penumbra' of mysticism. In our opinion the light of science, not its 'penumbra,' is 'sacred,' and invisible causes are 'commonplace' topics of an antiquated philosophy. We do not believe that natural phenomena are the visible effects of 'invisible causes' behind nature.

THE RELIGIOUS SENTIMENTS OF THE HUMAN MIND. By *Daniel Greenleaf Thompson*. London: 1888. Longmans, Green & Co.

It is after all not so very difficult to be just towards an author who is a pronounced adversary of ours. But it is a hard task for a reviewer if he make earnest efforts to treat an author with justice, to find that the latter's reasoning is as different from his own as if he had adhered to another system of logic; Mr. Thompson defines Religion as "the aggregate of those sentiments in the human mind arising in connection with the relations assumed to subsist between the order of nature (inclusive of the observer) and a postulated supernatural. The supernatural of Mr. Thompson is very different from the theological conception of the supernatural. It is more like the unknowable of agnosticism. He says: "Given a self-distinguishing and self-active consciousness which in the process of its self-distinguishing and in the exercise of its self-activity finds a limitation of its knowledge and power; which by virtue of that limitation is compelled to posit a something beyond the limit; and which has in constant employment a constructive faculty enabling it to develop fancies, imaginations, ideals, and hypotheses—given thus much, and the idea of a supernatural or an extra-natural with some notions about the same must inevitably arise. Hence the genesis of religious sentiments." But how can there be anything outside of nature? Our ideals have value only in so far as they may adorn and beautify nature or as they are realizable in life. Ideals which are not practicable are dreams, and a religion based on fancies is a superstition. Mr. Thompson, however, considers his supernatural as a concrete and positive something. He starts from the limitation of our cognition and indicates that there is in this 'negative' something positive unknown. "In all cognition whatever there is, as a part of the cognition, a cognition of a negative existence with a positive; and that the one is just as real objectively as is the other, is just as primary and as necessary." The existence of this extra-natural is proved in the following way: "After we have included in a synthesis all things, making a whole of nature, there is still something not included. An absolutely universal concept is impossible. Neither knowledge nor experience of any sort are possible without postulating a supernatural. The supernatural then is an extension of nature, and nature is not different in kind from the supernatural, but is, to speak paradoxically, a part of that supernatural." The author is rather in favor of Polytheism. "It is quite possible, of course, to conceive of a supernatural society ruled over by gods and demi-gods of great powers and enlarged perfections of character." The author objects to the public employment of prayer for "although it is an element of public worship, it is after all primarily a matter of individual communication to the power addressed." Among the platforms of religious organizations he selects as the best that of the Free Religious Association in the United States. The book is well written and everybody will find in it at least some of his pet notions; but all together form a strange mixture.

WHAT IS THE BIBLE? An inquiry into the origin and nature of the Old and New Testaments in the light of modern biblical study. By George T. Ladd, D. D., Professor of Philosophy in Yale University. New York: 1888. Charles Scribner's Sons.

It is considered strange that a freethinker should speak of the Bible with reverence and that a faithful Christian at the same time should critically search through its pages and publicly admit many of its deficiencies. However, it is not strange to those who have devoted their time and attention to the Bible—they can be blind neither to its greatness nor to its faults. Among the learned theologians of Germany the idea has long been abandoned that the scriptures are a literal inspiration of God; German freethinkers rail at churches, at dogmas, at the clergy, and at ecclesiastical institutions, but there is scarcely any reviling of the Bible. Prominent freethinkers have successfully used the Bible as their armory, for the Bible is full of radical ideas, and if Christ or some of the prophets would arise from their graves and preach as they did in former times, it is more than doubtful whether they would be allowed to speak freely. Prof. Ladd shows that the Bible is not what many of its sincere but mistaken defenders have assumed it to be; it is not what the current theology is accustomed to suppose. But he shows also that neither fidelity to the teachings of the Bible itself, nor adherence to the substance and spirit of the doctrine of the Church requires him to hold these opinions. We do not agree with the author in many points, which he as a faithful Christian perhaps considers essential, but we sympathize with the true religious spirit of honesty which declares that *the faith of the Christian cannot suffer from a knowledge of the truth*. Prof. Ladd concludes his work with the words of Prof. Delitzsch: "God is a God of truth! The love of truth, submission to the yoke of truth, abandonment of traditional view which will not endure the test of truth, is a sacred duty, and element of the genuine fear of God. 'Will ye be God's partisans?' exclaims Job indignantly to his friends, who assume to him the part of advocates for God, while they distort the facts on which the issue rests in *maiorum Dei gloriam*."

DIE MONISTISCHE SEELENLEHRE. Ein Beitrag zur Lösung des Menschenräthels. Von Carl du Prel, Ph. D. Leipzig: 1888. Ernst Günther.

Carl du Prel has made his name famous through his essay "The Struggle for Existence in the Skies," (*Der Kampf um's Leben am Himmel*), which has appeared in its third edition under the title, *Entwicklungsgeschichte des Weltalls* (Evolution of the Universe). Du Prel has thus introduced Darwinism into Astronomy, showing that the stars also have to struggle for the space they occupy and only the fittest will survive. Carl du Prel has in his latest publications ventured upon the dangerous ground of mysticism. He published in 1885 his *Philosophie der Mystik*, and in the work before us he has incorporated his ideas upon the nature of the soul. The author objects to Materialism and Spiritualism by attempting to conceive the idea of the soul monistically. But his idea of the soul is a materialistic spiritualism. He considers the soul as the thinking and organizing principle and deduces from his definition that the soul must find an embodiment of some kind. On this ground he builds his conception of an astral body (p. 154). Du Prel accepts also the idea of 'one's double' and explains it as an appearance of the astral body (Chap. VII, *Der Doppelgänger*; VIII, *Gelegenheitsursachen der Doppelgänger*; IX, *Die psychischen Ursachen der Doppelgänger*; X, *Die Thätigkeit des Doppelgängers*; XI, *Die Solidarität der Phantoms mit dem Körper*). In the last two chapters Du Prel discusses Death. *Die Entseelung des Leibes*, the disappearance of the soul in the body (disempsychosis) is the negative aspect of death. On page 280 he says: "In the balance, supersensible life rises according as the sense-life sinks. In sleep, somnambulism, and death we have three degrees of the *Entse-*

*lung* of the body. But these three degrees correspond to equivalent transcendental functions of a disembodiment of the soul (*Entleibung der Seele*). We can not approve of Du Prel's views and must object to his using the unverified reports of too credulous people and statements of somnambulist as established facts. The publisher (Ernst Günther, Leipzig) announces that they have in press another smaller work by Du Prel, which promises to be very interesting. Its title is *Die Mystik der alten Griechen*.

CHEAP BOOKS AND GOOD BOOKS. By Brander Matthews. New York: 1888. The American Copyright League.

This pamphlet is a revision and amplification of an 'Open Letter' published in 'The Century' for December, 1887, and of an address delivered before The Congregational Club of New York on the evening of February 20, 1888, and published in the 'Christian Union' of March 15, 1888. The author advocates an International Copyright. He says: "There are still a few who declare that the People must have cheap books, and that therefore the People will not permit the passage of any bill for International Copyright. \* \* \* But with infrequent exceptions, books are not now cheaper in America because there is free stealing from the foreigner. \* \* \* The books which are made cheaper by piracy are nearly all English novels." In a survey of the conditions of publishing in England, France, and Germany, it is shown that "what might seem, at first sight, to be a paradox, is only the exact truth. In America the cheapest books are not good books, for the most part; certainly they are not the best books. In Europe the best books are the cheapest." Mr. Matthews maintains that "this unfortunate state of affairs in this country is the result of the absence of International Copyright, and the inevitable instability of the book trade;" and he asserts also that "the consequences of the present unhealthy condition are injurious to the character of the American people. We now enjoy the privilege of piracy, as the dwellers on a rocky islet used to enjoy the privilege of wrecking—and we avail ourselves of this privilege only to the perdition of our souls. \* \* \* No one has more nobly spoken of the crime of book-murder than John Milton, and with a quotation from him I may fitly conclude: 'For books are not absolutely dead things, but do contain a potency of life in them to be as active as that soul was whose progeny they are; nay, they do preserve, as in a vial, the purest efficacy and extraction of that living intellect that bred them. I know they are as lively and as vigorously productive as those fabulous dragon's teeth; and being sown up and down may chance to spring up armed men. And yet, on the other hand, unless weariness be used, as good almost kill a man as kill a good book. Who kills a man, kills a reasonable creature, God's image; but he who destroys a good book kills reason itself, kills the image of God, as it were, in the eye. Many a man lives a burden to the earth; but a good book is the precious life-blood of a master-spirit, embalmed and treasured up on purpose to a life beyond life.'" The cover of Mr. Brander Matthews' pamphlet is neatly ornamented with two fac-similes, one an extract from a letter of Longfellow's which reads: "Whatever is just is for the benefit of all; and I wish we could have a law providing, between England and America, that a copyright taken out in either country shall be equally valid in both." The other fac-simile is a verse of J. R. Lowell's:

In vain we call old notions fudge  
And bend our conscience to our dealing,  
The ten commandments will not budge,  
And stealing will continue stealing.

SYSTEM OF ECONOMICAL CONTRADICTIONS; OR, THE PHILOSOPHY OF MISERY. By P. J. Proudhon.

This constitutes the fourth volume of Proudhon's Complete Works, and is uniform in style with the first volume, "What is Property?" The second and third volumes of the Complete

Works have not yet been published in English. The next volume to appear will be the fifth of the Complete Works,—that is, the second and final volume of the "Economic Contradictions." The Complete Works will comprise about fifty volumes, which are being published in quarterly parts of sixty-four pages each, as a periodical under the name of the "Proudhon Library." A prospectus giving full details of the enterprise may be had by applying to Benj. R. Tucker, Box 3366, Boston, Mass. As these are subscription books, no discount on them is given to the book trade, but subscribers to the "Proudhon Library" get them at a saving of about thirty per cent. The publication of Proudhon's Works must be considered as a meritorious act on the part of the editor of *Liberty*. We do not believe in Anarchism, but we acknowledge that the views of the father of Anarchism should be known and appreciated by everybody. Proudhon is a keen critic of the economical evils of his time, most of which are prevalent still. His remedy, however, it is to be feared, will not cure the evils, but will lead society to a speedy dissolution, for his remedy is Anarchism.

THE BEGINNINGS OF RELIGION. An essay by Thomas Skott Bacon. London: 1887. Rivingtons.

A book which deserves the attention of those who believe that they serve God in unreservedly accrediting what they think has been written by his authority. Instead of faithful investigation of facts, the author essays to state "what we ought to think of the beginning and course of Religion." Other Bible interpretations than submissive acceptance is declared to be "the very height of self-deluding folly." Mr. Bacon says on p. 209: "The more I think of it, the more I am persuaded that we can only wisely and safely take it as it reads and wait until God shall reveal to us more than thus appears." Max Müller is often quoted and severely criticised; the latter rejects for instance the notion of Hebrew being the original language of mankind and does not consider it worth his refuting, while Mr. Bacon informs us "that there is a 'real and a very material degree of evidence' for it."

SARA CREWE; OR, WHAT HAPPENED AT MISS MINCHENS. By Frances Hodgson Burnett. New York: 1888. Charles Scribner's Sons.

This book was read to a large family circle and not one of the children missed a syllable of it. If they were always so attentive at school, their teacher would never have any cause to complain. The book is good in every respect.

As the best book for young people who are familiar with German can be recommended the ILLUSTRIRTE WELTGESCHICHTE by Otto von Corvin, the second edition of which is revised by L. T. Diefenbach, published at Otto Spamer's, Leipzig and Berlin. The eight volumes can be had separately. The first volume, which has been received at this office as a specimen, treats of the history of antiquity including the Egyptians, Indians, Hebrews, Greeks and a great part of Roman history. It contains illustrations, six charts and nine plates. The language is excellent and can serve throughout as a specimen of fluent, narrative style. The price of each volume varies according to size from \$2 to \$3.

ALLERLEI DEUTSAMES. Bilder und Geschichten von Hans Grasberger. Leipzig: 1888. A. G. Liebeskind.

Hans Grasberger is a Vienna journalist and art-critic. His former publications are mostly original Austrian, and partly written in Austrian dialect. We mention *Nix für ungut*, *Schnaderhüpfeln* and *Plödersan Geist'n Geschichte'n* (both published by A. G. Liebeskind, Leipzig). The title of his latest publication, *Allerlei Deutsames*, is one of those phrases that cannot be translated. It means: 'All kinds of things that set us a-thinking.' The little vol-

ume contains twenty short and suggestive tales, some of them are phantastic, some humorous, some traveler's adventures, and almost all exhibit a vein of fine and poetic sentiment.

DER ALTINDISCHE GEIST. In Aufsätzen und Skizzen von Michael Haberlandt. Leipzig: 1887. A. G. Liebeskind.

Mr. Haberlandt is a member of the editorial staff of the *Neue Freie Presse* of Vienna and has published many essays and sketches on early India in the columns of this journal. They are now gathered in a neat little volume of 352 pages in large 12mo. The book contains fifty-seven articles; all of them are popular and many extremely interesting. Among other things we learn that the biblical expression "I am Alpha and Omega, the beginning and the end, the first and the last," is of Hindoo origin. Certainly it is not a Greek, nor a Jewish, nor a peculiarly Christian idea to employ a grammatical simile for describing the omnipresence and eternity of God. This is the method of the contemplative and philosophical Indian. We read in the *Rigveda-Gita*, the song of Solomon in the philosophical literature of India: "I am the A among the letters and the bond of union in their composition (viz., in the word), I am the eternal fate and the omnipresent creator. And the Upanishades praise the name of *Purā-purā-vastu* as the first and the last, 'the beginning and the end of the eternal Brahman.'

CHIPS FROM A TEACHER'S WORKSHOP. By L. R. Klemm, Ph. D.

Formerly Supervisor of German Department Public Schools, Cleveland, O.; Principal of a Normal Department, Cincinnati, O., etc. Boston: 1888. Lee & Shepard.

A meritorious book, the author of which shows great discretion and sound judgment. We quote from p. 126 the following passage: "There is in every nation, as in the life of every individual, a time of plasticity. During this time the human being develops his individuality. The English settlers in America adapted themselves to surrounding circumstances and developed a type peculiarly American. In the same way the mode of teaching and learning had developed certain peculiar traits, had become typical. We all know what caused the great abundance of *self-made men*: they were, and still are, typically American. Now, the typical American boy gained his knowledge as the man gained his fortune,—namely, without assistance. What he is and has, he is and has by his own exertion, attended by much waste of time and energy. That the typical American teacher of *your kept school*, *heard recitations*, *assigned lessons*, *examined*, and *tested daily and hourly*, we can comprehend—and pardon. But life, and the American people have changed. The old American type is fast receding, since untold millions of immigrants have arrived. The Union is a gigantic crucible, within which the representatives of the different nations are fused to a homogeneous whole. Each nation adds some of its virtues, and, alas! some of its vices, to the fusion. We are at present in a second era of plasticity. When the great influx of foreign elements ceases, the mixture in the crucible will become clear, and the future type of the American school will have been developed. It will not be European, rest assured; neither will it be American, as that term is now understood. It is devoutly to be hoped that the pernicious marking system, immoral competition, constant testing, and soulless memorizing of the printed page, will not be leading features of the new American school."

GUATEMALA THE LAND OF THE QUETZAL. A sketch by William T. Brigham, A. M. New York: 1887. Charles Scribner's Sons.

Guatemala and Honduras are countries strangely neglected by the American traveler as well as by the American merchant. There are thousands of square miles of wholly unexplored territory between the low Isthmus of Tehuantepec and the Lake of Nicaragua. And yet, Mr. William T. Brigham says: "No country on the

northern half of the American continent has a finer climate or more beautiful and varied scenery, or is a more attractive field for the genuine traveler." Mr. Brigham believes in the increasing importance of Central America, both geographically and politically. He has collected for his own use and printed for the use of others notes made during three journeys in Guatemala and Honduras. In his book he seeks also to awaken among Americans greater interest in a land which was the cradle of a peculiar civilization on this continent, and whose recently explored monuments are most justly claiming the study and admiration of archaeologists in Europe as well as in America. The illustrations of this book are made from photographic plates taken by the author himself, so that accuracy has been secured. The book is soberly written and free from sensational stories, hair-breadth escapes and other things which spoil many accounts of travelers. The charts are valuable additions, and as a whole the neat and stately volume deserves the attention of parents and school librarians.

Under the title of "A Printer's Paradise," Theodore L. De Vinne, the printer of *The Century*, has contributed to the June number of that magazine a highly interesting, illustrated article on the Plantin-Moretus Museum at Antwerp.

FIRST STEPS WITH AMERICAN AND BRITISH AUTHORS. By *Albert F. Blaisdell, A. M.* Boston: 1888. Lee and Shepard.

The purpose of this book is to provide students with a judicious and methodical introduction to the English classic texts. The plan is practical and the selection of pieces is a good one.

NEXT DOOR. *Clara Louise Burnham.* Paper Series. Boston: Ticknor & Co.

A light novel, with no seriously objectionable features perhaps, but on the other hand with nothing sufficiently strong or sensible in the plot, neither careful or finished in the execution to repay the reading. C. P. W.

ZOOLOGICAL SKETCHES. A Contribution to the Out-door Study of Natural History. By *Felix L. Oswald.*

Is one of the most interesting books of juvenile literature, which should not be missing even in the most limited nursery-libraries of American children. It is fascinating from the beginning to the end and teaches Zoölogy by way of entertainment. It is a pleasure to look at the many illustrations which have evidently been selected with great care, for all of them are characteristic of the psychical life of animals and many possess an additional zest of humor which will make the book the more dear to children.

THE MINISTER'S CHARGE. *W. D. Howells's* Paper Series. Boston: Ticknor & Co.

The Minister's Charge stands at the head of Mr. Howells's second-best stories, classing A Modern Instance, and Silas Lapham among the best. It is not only marked by the author's well known felicity of style, delicate humor and photographic reality, but by a serious moral purpose which is oftener manifest in Mr. Howells's works than his critics are willing to admit. In the principal character of the book, Lemuel Barker, we have one of the author's finest pieces of characterization, a raw, untutored country youth, fired with a noble ambition for the delights and opportunities of the cultured life of his social superiors, yet having a plain and devout integrity within his bosom that prevents him from ever basely truckling to unworthy motives, or ignobly yielding his ideal of right and goodness for any worldly gain or advantage. The character of Mr. Sewall, the accomplished, refined but over-scrupulous Unitarian minister, is also marvelously well drawn. C. P. W.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

### CHAPTER XVII.

THE DECEPTION OF MR. HUMMEL.

In the houses of the park there reigned peace, forbearance and secret hope. Since the arrival of Ilse the old strife seemed to have ceased, and the hatchet to have been buried. It is true that Mr. Hummel's dog snarled and snapped at Mr. Hahn's cat and was boxed on the ear in return; and that the porter, Rothe, of A. C. Hahn, declared his contempt of the storekeeper of the factory of Mr. Hummel. But these little occurrences passed away like inoffensive air-bubbles which rise in the place where there has been a whirlpool of enmity. The intercourse between the two houses flowed on like a clear brook, and forget-me-nots grew on its banks. If a misanthropical spell had adhered to the ground at the time when Madame Knips ruled there alone, it had now been expelled by female exorcists.

One morning, shortly before the fair, a book-seller's porter placed a pile of new books on the Doctor's writing-table; they were the advance copies of the first great work he had written. Fritz opened the book and gazed at the title-page for a moment in quiet enjoyment; then he hastily seized his pen, wrote some affectionate words on the fly-leaf and carried it to his parents.

The book treated, to use Gabriel's expression, of the old Aryans as well as of the old Germans; it entered into the life of our ancestors before the time in which they took the sensible resolution of making pretty nosegays on the Blocksberg and rinsing their drinking horns in Father Rhine. It was a very learned book, and so far as the knowledge of the writer reached, it revealed many secrets of antiquity.

It was not necessary for strangers to inform the father and mother of the importance of the book which Fritz now brought them. The mother kissed her son on the forehead, and could not control her emotion when she saw his name printed in such large and beautiful characters on the title-page; but Mr. Hahn took the book in his hands, and carried it into the garden. There he laid it on the table of the Chinese temple, read the dedication several times and took a turn or so about the pavilion, looking in again occasionally, in order to observe whether the style of building harmonized well with the book; then he cleared his throat in order to master his joyful emotions.

Not less was the pleasure in the study of the Professor; he went hastily through the book from beginning to end. "It is remarkable," he then said, much pleased, to Ilse, "how boldly and firmly Fritz grapples with the subject; and with a self-control, too, for which I should not have given him credit. There is

\* Translation Copyrighted.

much in it that is quite new to me. I am surprised that he should have concluded the work so quickly and quietly."

What the learned world thought of the Doctor's book may be known from many printed eulogies. It is more difficult to determine what effect it had in his own street. Mr. Hummel studied a detailed review of the work in his paper, not without audible marks of disapprobation however; he hummed at the word Veda and grumbled at the name Humboldt, and he whistled through his teeth at the praise which was accorded to the deep learning of the author. "When at the conclusion the reviewer formally thanked the Doctor in the name of science, and urgently recommended the work to all readers, Mr. Hummel's humming broke into the melody of the old Dessauer, and he threw the paper on the table. "I do not intend to buy it," was all that he vouchsafed to say to his wife and daughter. But in the course of the day he cast an occasional glance at the corner of the hostile house where the Doctor's room was, and then again at the upper story of his own house, as if he wished to weigh the comparative merits of both the learned men and their abodes.

When Ilse told Laura her husband's opinion of the book, Laura colored a little, and replied, throwing back her head: "I hope it is so learned that we need not meddle with it." Yet this disinclination to meddle with the book did not prevent her some days later from borrowing the book from the Professor, upon the plea that she wished to show it to her mother. It was carried to her own little room, where it remained for a long time.

Among the other inhabitants of the street, the importance of the Hahn family—whose name had acquired such renown, and whose Fritz was praised so much in the papers—was greatly increased. The scales of popular favor sank decidedly on the side of this house, and even Mr. Hummel found it expedient not to object to his family's speaking with moderate approbation of their neighbor's son. When Dorchien, as sometimes happened, met Gabriel in the streets, she even ventured to accompany him for a few minutes into the courtyard of the enemy, in spite of the growling of the dog and the sinister frowns of the master.

One warm evening in March she had said a few civil words to Gabriel in passing and was tripping neatly across the street to her own house, with Gabriel looking after her full of admiration, when Mr. Hummel came out just in time to witness the last greeting.

"She is as pretty as a red-breast," said Gabriel to Mr. Hummel. The latter shook his head benevolently. I well see, Gabriel, how the wind blows, and I say nothing, for it would be of no use. But one piece of

good advice I will give you. You do not understand how to deal with women; you are not gruff enough with the girl. When I was young they trembled at the faintest movement of my handkerchief, and yet they swarmed about me like bees. This sex must be intimidated and you'll spoil all by kindness. I think well of you, Gabriel, and I give you this counsel therefore as a friend. Look you, there is Madame Hummel. She is a strong-willed woman, but I always keep her under restraint; if I didn't growl, she would. And, as there must be growling, it is more agreeable for me to do it myself."

"Every animal has its ways," replied Gabriel. "I have no talent for acquiring the habits of a bear."

"It can be learnt," said Mr. Hummel, benignantly. He raised his eye-brows, and made a sly grimace. Something is in progress in the garden over there; they are probably speculating again on some new arrival, to which I, in due time, shall take upon myself, under all circumstances, to give the right name—he lowered his voice—; "something anonymous has been unpacked, and brought out into the garden." With a feeling of indignation at his own caution, he continued: "Believe me, Gabriel, the world is growing cowardly from this over-production of children; and people are so crowded that freedom ceases to exist; life is now slavery from the cradle to the grave. Here I stand on my own ground, and if I choose to dig a hole on this spot to the centre of the earth, no man can prevent me; and yet, on my own property, we cannot express an outspoken opinion; and why? Because it might be heard, and displease the ears of strangers. To such a point have we come; a man is the slave of his neighbors. Now, only think, I have but one neighbor opposite; on the other side I am protected by the water and the factory, yet I must swallow the truth, as I dare not speak out beyond my boundary. He who is surrounded on all sides by neighbors must lead a lamentable life; he cannot even cut off his head in his own garden without the whole neighborhood raising a cry because the sight is not pleasing to them." He pointed with his thumb to the neighboring house, and continued, confidentially: "We are reconciled now; the women would not rest until we were. I assure you they lacked the true spirit to carry on a quarrel over there; the affair became tedious and so I gave in."

"Yet it is well that all is settled," said Gabriel. "If the fathers quarrel, how can the children meet on good terms?"

"Why shouldn't they make faces at each other?" returned Mr. Hummel, crossly. "I can't bear this everlasting bowing and scraping."

"Every one knows that," replied Gabriel. "But if

Miss Laura meets the Doctor in our house, which often happens, she surely cannot growl at him."

"So they meet often?" repeated Hummel, thoughtfully. "There again you have an instance of this overcrowding; they can't get out of each other's way. Well! I can trust to my daughter, Gabriel; she has my disposition."

"I wouldn't be so sure of that," replied Gabriel, laughing.

"I assure you she is quite of my mind," affirmed Hummel, decidedly. "But, as to this cessation of hostilities, you need not rejoice so much at it; for, depend upon it, it cannot last long between our houses. When the ice has thawed, and the garden amusements begin, there will be trouble again. It has always been so and I do not see why it should not continue so, in spite of reconciliations, and in spite of your new mistress, for whom I nevertheless have great respect."

The conversation, which had been carried on in the garden, was interrupted by a dark, solemn-looking man, who presented a large letter in a tinted envelope, and introduced himself to Mr. Hummel, bringing him an invitation for his absent daughter to undertake the office of godmother to a baby that had just been born to limit the space in the world still more. To this invitation no objection could be made; the young mother, the wife of a lawyer, was Laura's friend, and the daughter of her godmother. It was an old connection of the family, and Hummel, as father and citizen, duly accepted the invitation.

"For whom is the other letter you have in your hand?" he asked of the messenger.

"For Doctor Hahn, who is to stand with Miss Laura."

"Indeed!" said Hummel, ironically; "matters are going at a great pace. Take your letter over there. Did I not tell you so, Gabriel?" he added, turning to his confidant. "Scarcely reconciled before the tribunal, and at once sponsors together; who may know but that to-morrow morning the old scare-crow himself will come over and offer to be 'hail fellow well met' with me. There again you have the consequences of over-crowding, and of Christianity too. This time my poor child is the victim."

He took the letter into the room and threw it on the table before his wife and daughter.

"This comes from reconciliation, weak women," he cried, ill-naturedly. Now you will have nurse, midwife, godfather, and all, about your heels."

The ladies studied the letter, and Laura thought it inconsiderate in her godmother to have chosen just the Doctor for her partner.

"That's to accommodate the sponsors' carriage," exclaimed Mr. Hummel, mockingly, from the corner. "It was made to carry two at once. Now, that fellow

Humboldt will come over here in white gloves in order to fetch you to church, and I believe he has impudence enough to send you a sponsorial present."

"If he did not do so, it would be an insult," replied the wife. He must do it, or it would give occasion for people to talk. We cannot object to it; he will send a basket of flowers with gloves for the god-mother, and Laura will send him in return the pocket-handkerchief, as is the custom among our acquaintances. You know that Laura's godmother thinks a great deal of these things."

"His flowers in our house, his gloves on our fingers, and our handkerchief in his pocket!" said the master of the house, querulously; "that will be right merry."

"I beg of you, Hummel," rejoined his wife, displeased, "do not annoy us by finding fault with the civilities which are unavoidable on such an occasion, and of which no one takes advantage."

"I thank you for your civilities which one cannot avoid, and to which no one attributes anything. Nothing is so insupportable to me, among the people here, as their eternal obeisances before one's face, whilst they pull one to pieces behind one's back."

He left the room and slammed the door behind him.

The mother then began:

"He has nothing really to say against it; he only wishes to maintain his character for sternness. It is not absolutely necessary that you should send the Doctor a present on this occasion, but you still owe him some little attention from that encounter with the shepherd."

Laura was reconciled to the thought of becoming godmother with the Doctor, and said:

"I will make a design for the corner of the handkerchief, and will embroider it."

The following morning she went out to buy cambric. But Mr. Hummel also went out. He visited an acquaintance who was a furrier, took him confidentially aside, and ordered a pair of gloves of white cat's skin for a small hand; he directed that a cat's claw be fastened at the point of each finger. But he wished it to be a delicate one of an unborn cat, or failing in that, of a very young kitten, and that the claw should stand out stiffly. Then he entered another shop and asked for some colored printed cotton pocket-handkerchiefs—such as one buys for a few pennies—and chose one black and red, with a frightful portrait, that just suited his frame of mind. This purchase he put in his pocket.

The morning of the christening arrived. In the house of Mr. Hummel the flat-irons clattered; the mother added some last stitches; and Laura tripped busily up and down the stairs. Meanwhile, Hummel

wandered back and forth between the door of the house and factory, watching every person that entered. Spitehahn was sitting on the threshold, growling whenever the foot of a stranger approached the door of the house.

"Show yourself as you are, Spitehahn," grumbled Hummel, approaching his dog; "and catch hold of the woman from yonder by the dress; she will not venture in if you keep watch."

The red dog answered by showing his teeth maliciously at his master.

"That's right," said Hummel, and continued his walk.

At last Dorchen appeared at her own house-door, and tripped with a covered basket in her hand to the steps of Mr. Hummel's house. Spitehahn rose grimly, uttered a hoarse growl, and bristled his hair.

"Call the frightful dog away, Mr. Hummel," cried Dorchen, snappishly. "I have a message to Miss Laura."

Hummel assumed a benevolent expression, and put his hand in his pocket.

"The ladies are at work, my pretty child," he said, drawing out a heavy piece of money; "perhaps I can attend to it."

The messenger was so startled at the unexpected politeness of the tyrant, that she made a mute courtesy and let the basket slip out of her hand.

"It shall be attended to carefully," said Mr. Hummel, with an engaging smile.

He carried the basket into the house, and called Susan to take it to the ladies; after which he went into the hall again, and stroked the dog. It was not long before he heard the door of the sitting-room fly open and his name called loudly in the hall. He entered cautiously into the ladies' room, and found them in a dreadful state of disturbance. A beautiful basket was standing on the table, flowers lay scattered about, and two little fur gloves, with large claws at the ends of the fingers, lay on the floor, like paws cut from a beast of prey. Laura was sitting before them sobbing.

"Holloa," cried Mr. Hummel, "is that one of the sponsorial pleasantries."

"Henry," cried his wife, vehemently, "your child has received an insult; the Doctor has dared to send these to your daughter."

"Ha!" cried Hummel; cat's paws, and with claws! Why not? They will keep you warm in church; you can lay hold of the Doctor with them."

"It must be a joke," cried Laura, with the hot tears flowing down her cheeks; "it is because I have sometimes teased him. I should never have believed him capable of such rudeness."

"Do you know him so well?" inquired Mr. Hummel.

Well, if it is a joke, as you say, take it as a joke then; this emotion isn't necessary."

"What is to be done now?" cried the mother; "can she still stand godmother with him after this insult?"

"I should think so," replied Mr. Hummel, ironically; "this insult is a childish affair compared to others—compared to house-building, bell-ringing, and dog-poisoning. If you can stomach all that, why not cats' paws, too?"

"Laura has hemmed and embroidered a handkerchief for him," exclaimed the mother; "and she had taken the greatest pains to finish it in time."

"I will not send it to him," cried Laura.

"So you hemmed and embroidered it yourself?" rejoined Hummel. "It is charming to live in friendship with one's neighbors. You are weak women-folk, and you take the matter too seriously. These are courtesies which one cannot avoid, and to which no importance is attached. Do as you said you would. You must just send the thing over to him. You must not give him or any one else occasion to make remarks. Keep your contempt to yourself."

"Father is right," cried Laura, springing up; "away with the handkerchief, and my account with the Doctor will be closed for ever."

"That's right," assented Hummel. "Where is the rag? Away with it."

The handkerchief lay ready on a plate, wrapped up in fine blue paper, and also covered with spring flowers.

"So this is the hemmed and embroidered thing? We will send it over immediately."

He took the plate from the table, and carried it quickly into the factory; from thence the blue packet went, with many compliments, to the godfather in the house of the enemy.

Mrs. Hahn brought the card of greeting and the present to her son's room.

"Ah, that is a charming attention," remarked the Doctor, closely examining the flowers.

"It is not so customary now-a-days to send presents to the gentlemen too," said the Doctor's mother. "I always thought it such a pretty custom."

She unfolded the paper inquisitively, and looked up in astonishment. A printed cotton handkerchief lay within, as thick as leather and woven with coarse threads. It might be a mask only, and in this hope she unfolded it, but a frightful caricature alone appeared in diabolical colors of red and black.

"That is not a nice joke," said the mother, vexed.

The Doctor looked downcast. "I have sometimes teased Laura Hummel. This probably has reference to some bantering that has passed between us. I beg of you, mother, to place the flowers in a glass."

He took the handkerchief, concealed it in a drawer, and again bent over his writing.

"I should not have expected this of Laura," continued the mother, much disturbed. But as her son did not encourage further complaints, she arranged the flowers for him and left the room, pondering upon the mortification of her child.

The carriage drove up and the Doctor got into it to fetch the godmother.

"Our doors are so near together," said Hummel, who was standing at the window, "that he will only just have time to creep out from the other side."

After some difficulty in turning, the carriage arrived at the steps of Mr. Hummel. The servant opened the door, but before the Doctor could jump down Susan appeared on the steps and called out:

"Do not take the trouble of entering, the young lady will come immediately."

Laura swept down the steps, all in white as if veiled in a snowcloud; and how pretty she looked! Her cheeks were indeed paler than usual, and her brows were gloomily knit, but the sad expression gave an enchanting dignity to her countenance. She avoided looking at the Doctor, only slightly moving her head at his greeting, and when he offered his hand to assist her, she passed by him and seated herself in her place as if he were not there. He had some difficulty in finding room next to her; she nodded, ignoring him, to Mr. Hummel, who was standing on the steps looking far more cheerful than his child. The horses trotted slowly on; Laura looked neither to the right nor to the left. "It is the first time she officiates as godmother," thought the Doctor, "that causes this solemn mood; or perhaps she is repentant because of the colored handkerchief!" He looked at her hands; the gloves that he sent were not to be seen. "Have I offended against etiquette?" he thought again, "or were they too large for her little hands?"

"He is silent," she thought, "that is his bad conscience; he is thinking of the cat's claws, and has not a word of thanks for my pocket-handkerchief; I have been sadly mistaken in him." This consideration made her so sorrowful that tears again rose to her eyes; but she pressed her lips tightly together, squeezed the thumb of her right hand, and silently counted from one up to ten, an old recipe she had formerly used for restraining vehement feeling.

"Things cannot go on so," thought the Doctor, "I must speak to her.—You have not been able to use the gloves that I ventured to send you," he began modestly; "I fear I have made a bad selection."

(To be continued.)

And what is reason? Be she thus defined:  
Reason is upright stature in the soul.—Young.

### Three Introductory Lectures

## The Science of Thought.

Delivered at the Royal Institution, London, during the month of March, 1887.

First published in THE OPEN COURT of June, July, and August, 1887.

BY F. MAX MÜLLER.

Chicago: 1888.

THE OPEN COURT PUBLISHING COMPANY.

Neatly Bound in Cloth. Price, 75 Cts.

## THE OPEN COURT,

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE OPEN COURT is devoted to the work of conciliating Religion with Science. The founder and editor have found this conciliation in Monism—to present and defend which is the main object of THE OPEN COURT.

THE OPEN COURT has for contributors the leading thinkers of the old and new world.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social and economic questions.

TERMS, \$2.00 PER YEAR. \$1.00 FOR SIX MONTHS.  
\$0.50 FOR THREE MONTHS. SINGLE COPIES, 10 CTS.

All communications should be addressed to

THE OPEN COURT,

(Nixon Building, 175 La Salle Street.)

P. O. DRAWER F,

CHICAGO, ILL.

### Contents of Recent Numbers.

#### REFLEX MOTIONS.

G. H. SCHNEIDER.....In No. 24.

G. H. Schneider's book, *Der Atmanische Willkür*, is one of the most prominent delineations of modern psychological research. The essay on Reflex Motions is a translation of the basic chapter of Schneider's work. It contains the fundamental propositions of physiological psychology.

#### EVOLUTION AND IDEALISM.

PROF. E. D. COPE.....In No. 23.

A very able statement of Positivism and scientific inquiry versus the imagination of a wrong Idealism. Prof. Cope treats this subject with perspicuity and strength. His essay should be compared with the Editorial of No. 33 "Idealism, Realism and Monism."

#### TRUSTS AND UNIONS AND

#### IS THE BANKING SYSTEM A MONOPOLY?

LYMAN J. GAGE.....In No. 38 and 39.

These two essays contain the subject-matter of the author's lecture in the Economic Conferences. Mr. Gage is one of the most prominent bankers in the financial world. His view of the banking system in reference to the social problem deserves the attention of all parties. An answer to his propositions from the standpoint of a laborer will be given by Wheelbarrow in No. 40.

## BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.

BY FELIX L. OSWALD, M. D.

Part IX.

### EDUCATION.

In the specific development of individuals, education plays the part which artificial selection plays in the development of the race; and there is an unmistakable analogy in the phenomena of physical culture and of moral training. The inculcation of moral (or immoral) principles is a mental grafting process. The type of the preceptor's mind not only impresses itself upon the mind of the pupil, but the mental scion grows and develops with the growth and development of the receptive brain. "An idea in the brain," says Oliver Wendell Holmes, "is not a legend carved on a marble slab; it is an impression made on a living tissue, which is the seat of active nutritive processes. Shall the initials I carved in bark increase from year to year with the tree? and shall not recorded thought develop into new forms and relations with my growing brain?"

That growth may even transcend the development of the parent-tree. New principles and new tendencies expand from generation to generation, and a fructifying thought may bear its fruit in subsequent ages and propagate a more and more abundant crop, by the same law of survival which favors the propagation of the most vigorous plants and the "fittest" competitors in the arena of animal life.

An even more striking analogy in the process of physical and moral development is the superior efficacy of early training. The *Ur-formen*, the primordial types of life, are reproduced in the germs of every new birth, and the development of individual organisms can be modified by varying educational influence almost as strangely as varying circumstances modified the development of the species—the *lower* forms, *i. e.* those nearest the earlier type, being in both cases the more plastic ones. Mosses and grasses undergo curious variations under varying conditions of soil and climate; fungi derived from the seed of the same parent-plant, diverge according to their incidental base of development, so much, indeed, that the germ fastening upon decaying animal tissue will produce forms differing beyond the possibility of identification from the forms developed from a sister-germ, nourished by the de-

composition of vegetable tissue. Lubbock's researches have established the equally curious fact that modifications of food alone are sufficient to develop a queen-bee from the *larva* of any working-bee, but that no change of diet will ever modify the organism of a fully-developed worker. And only in childhood the brain seems capable of receiving impressions which modify the moral tendencies for better or worse and give arbitrary dogmas the force almost of congenital instincts. Arthur Schopenhauer held that the human mind, like a flowering plant, has only a brief spring-time of development and that all moral and mental results of after-life are only the fruits of germs sown in childhood. "Hence," he adds, "the educational solicitude of dogma-mongers who renounce the hope of converting fullgrown skeptics, but perpetuate their power by monopolizing the training of youth, well knowing that early impression will secure the reception of any tenet, no matter how extravagantly absurd."

Artificial selection has varied the *Ur-form* of certain domestic animals to a degree almost precluding the belief in the possibility of a common origin of such divergent types as those of the Italian dwarf greyhound, for instance, and the gigantic mastiff, or the smallest varieties of Thibetan ponies compared with the largest breeds of Norman cart-horses. Yet hardly less striking moral contrasts have been evolved from a common ancestral type, often by historically demonstrable influences of contrasting education.

Extremes of magnanimity and intellectual vigor may characterize individuals whose near relatives have been degraded to ultra-bestial extremes of vice and superstition:

"Higher than Indra's you may raise your lot,  
Or sink it lower than the worm and gnat."—

by the influence of education, as well as by the persistent efforts of self-devotion. The very standards of good and evil may be modified by early training, and what Emerson calls "the influence of the social atmosphere." "The legal sanction of slavery," says Henry Thoreau, "seems to me as preposterous as a plan for turning our fellow-men into sausages," yet the "social atmosphere" of the cotton-states had imbued thousands of intelligent natives with a radically opposite view. The necessity and propriety of this "peculiar institution" seemed to the children of the south-

ern planter so self-evident that they saw no alternative of the current theory which associated the doctrine of abolition with all sorts of ignoble motives, beyond doubt from an inability to realize a degree of intellectual aberration sufficient to explain a theory so glaringly at variance with the logic of facts. "Willful blindness" seemed the only adequate explanation for a reluctance to relinquish such absurdities.

Our aversion to the strict enforcement of Sabbatarian "Blue Laws" is far exceeded by the proclivities of our Spanish-American neighbors, and the storm of indignation provoked by every attempt to interfere with their bull-fights is countenanced by the sympathy of some of their foremost philanthropists. "Are they really crazy, those Yankee bigots," asked a Mexican alcalde of my acquaintance, "or is all that rant only a pretext for fastening a quarrel, and skinning us out of another strip of territory? What in the name of common sense can be their real objection to the pastime of witnessing a *matanza*, or even a cock-fight? Don't they know that a bull would a hundred times rather die fighting than to be helplessly chained and butchered in a slaughter-house? A man wounded in a rough-and-tumble fight hardly feels his injuries in the excitement of the scuffle; but ask him how he feels if the Indians tie him to a stake and whet their butcher-knives. And where is the "cruelty" in permitting a man to risk his life for the amusement of his patrons? Do they suppose that we force our bull-fighters and make them fight against their will? Gran Dios! There are five-hundred applicants for every vacancy! The glory of an arena triumph is the day-dream of our young men, and I have seen one of them shed tears of mortification at the failure of his candidacy for the position of an assistant-matador. The same about cock-fights. Is it possible that those moralists of yours have never seen a couple of roosters volunteer a duello on their own dunghill? Can there be a doubt that Nature prompts them to fight? And are they any the worse for an assembly of spectators?... And, aside from all that, every open-eyed observer ought to know that circus games keep the rabble from much worse pastimes. Close the arena and you open a dozen rum-shops."

A good deal, of course, might have and has been said on the other side; and the charge of "willful blindness" would be exactly analogous to the recriminations of Christian Wolff's disputants who argued the color of a landscape which the one was contemplating through a pair of red, the other through a pair of blue spectacles. Education thus will bias the judgment of the most honest inquiries after the lessons of truth or of righteousness, and moral obtuseness in one respect may be offset by the activity of moral sympathies in many others. The same Spaniards, for instance, who utterly fail to comprehend the objections of our

anti-circus moralists relieve the wants of human distress with a heart-born compassion as different from our Northern "charity on general principles" as the emotional fervor of their piety differs from the routine-religion of our Sabbatarian stock-jobbers.

Education has specialized their sympathies; and is it not possible that the same explanation might refute a plurality of the favorite arguments against the brutalizing influences of that Paganism that countenanced the mutual butchery of the Roman gladiators? The circus-combats of ancient Italy were developed from the public contests of military champions, who gloried in their disregard of wounds and death, a form of stoicism, then valued as the very superlative of manly virtue. The author of "Latin Christianity" admits that the passion for *circenses* was shared by some of the noblest men of Imperial Rome, poets, philosophers, and patriotic statesmen; and many of the sport-loving pagans who failed to understand the motives of the Christian clamor for the abolition of their favorite pastime would have been equally unable to comprehend the inhuman fanaticism which soon after impelled those same moralists to drench the land with the blood of freethinkers and dissenters. Lecky has collected conclusive evidence in support of his theory that the "Persecution" of Christians by their Pagan rivals was prompted by purely political motives. The anti-physical tenets of the Galilean Messiah were dreaded as subversive to the basis of social welfare, but the most zealous persecutors of his followers extended their traditional tolerance of foreign religions to all other creeds of the superstition-teeming East: fire-worshippers, Brahmins, and Egyptian mystics flocked by thousands to the capital of the universe and exercised their *rites* with a freedom often denied by the despots of their native lands. Only a few weeks ago (April 25, 1888), a rope-dancer at Steubenville, Ohio, met her death by the sudden breaking of the wire-rope; yet half a week after her employers resumed their exhibition with a new performer. When a similar accident happened in the streets of pagan Rome, the protests of the populace induced the Government to interdict exploits of that sort, unless the performer would obviate the risk by means of a stout net, spread out beneath the entire length of his rope. Children were treated with leniency, the disciples of skeptic philosophers enjoyed an abundant measure of tolerance, and altogether the humanitarian spirit of pagan civilization compares favorably with that of Christianized Europe during the thousand years following the conversion of Constantine. Even the sternest disciplinarians of republican Rome yielded to appeals that would have failed to move the fanaticism of mediæval Inquisitors. Their instinctive love of benevolence erected altars to the genius of Mercy, but education trained the mani-

festations of that instinct to specific standards of right and wrong.

The mental and moral disposition of individuals may be regarded as a result of a struggle for supremacy between the influence of hereditary tendencies and the influence of education, in that widest sense including the "discipline of circumstances." The relative predominance of those factors depends generally on the earlier or later incipience of systematic education. History abounds with instances of "renegades" abandoning their civilized educators and rejoining their barbarous kinsmen. Herman the Cheruscan, Spartacus, and Abd-el-Kader led the revolt of their oppressed countrymen and taught them to fight despotism by its own system of superior strategy, but their defection was the natural result of *earlier* educational influences, reacting successfully against the training of later years: They had passed their childhood in the atmosphere of freedom. Australian savages who had been attracted by the *cuisine* of the English mission-houses and were entrusted with the duties and privileges of assistant missionaries, almost invariably whittled their crosses into boomerangs and returned to the bush. Prince Wittekind, after being forced to "crawl to cross," was even persuaded to attend the convent school of the Frankish colony, but smashed the skull of the first abbot who undertook to enforce the by-laws of monkish discipline, and fled to the fastnesses of the Westphalian forest. The posterity of those stiffnecked Westphalians, by the clerical control of infant-schools, have since been converted into the most submissive followers of the infallible church. The Turks, too, knew to appreciate the value of early training. For nearly a century their Janitzares were recruited from the infant sons of their Christian captives, and by a peculiar combination of religious and military training were transformed into zealous and valiant champions of the Crescent.

#### THE INDIVIDUALITY OF ATOMS AND MOLECULES.

BY REV. R. H. HIGGINS, M.A.  
MOLECULES.

The molecule of water  $H_2O$  has a *bios*\* of its own, which, as we have seen, does not extinguish the *bios* of the oxygen atom, or the *bios* of the double hydrogen atom. We are satisfied that the *bios* of the molecule  $H_2O$  is in some way derived from its component atoms. Yet they have not, in combining, destroyed their respective *bioi*. Surely, this looks very much like life *which can spend and not be spent*; but not in the least like mechanical action, which can do no such thing.

Add a single incandescent lamp to a series of a

thousand, adjusted so as to use up the current supplied by a dynamo; all the other lamps must suffer a corresponding loss. It is not uniformly so with life, which in its lower powers is indeed spent in spending. A plant sacrifices its life for the seed. In a living organism, reproduction is often naturally associated with death. But in the higher powers of life is realized the adage "there is that scattereth and yet increaseth." In the teacher, the composer, the artist, the poet, and the lover, the goings forth of life have for their issue the power of living more abundantly.

It may be replied: Why use such a term as *bios*, and why not at once say the "properties" of the atom? Because a mass that is a mere quantity or a fragment and has no individuality, may have properties. Our contention from the first has been that we are speaking of individuals, not of bits or of fragmentary masses.

The molecule of water is a simple example, but it will suffice to illustrate certain features in the relations between atoms and molecules.

1. The resulting molecule,  $H_2O$ , is as purely an individual as the atom H, or O.
2.  $H_2O$  derives its *bios* from the *bioi* of H and O.
3. No one from his present acquaintance with H and O could predict the characters of the *bios* of  $H_2O$ , resulting from their combination.
4.  $H_2$  and O do not extinguish their *bioi* whilst entering into the constitution of another *bios*.

Such are features in the process of chemical combination.

In the above list, substitute the term Animal, or Plant, for  $H_2O$ ; and the terms Sperm-cell and Germ-cell for H and O, leaving out the words molecule and atom. All the predications will hold good, and be fairly descriptive of features in the process of fertilization.

1. The animal or plant is as purely an individual as the sperm-cell or the germ-cell.
2. The animal or plant derives its *bios* from the *bioi* of the sperm-cell and the germ-cell.
3. No one ignorant of the history of the cells could, from ever so searching an investigation into the sperm-cell and the germ-cell, predict the characters of the *bios* of the animal or plant resulting from their combination.
4. The sperm-cell and the germ-cell do not extinguish their *bioi* whilst entering into the constitution of another *bios*—that of the resulting animal or plant; for inherited characters transmitted through the sperm-cell or the germ-cell sometimes do not make their appearance till life is far advanced.

It seems a reasonable inference that what occurs in the comparatively simple molecule,  $H_2O$ , occurs also in the highly complicated molecule of the carbon products, in which perhaps twenty or more atoms

\* The *bios* is intended to denote that primordial potency, by virtue of which the atom possesses and exercises elective affinity, and whatever else may unite to make up its idiosyncrasy as an individual.

combine to form an individual molecule. It seems also probable that not one of these atoms wholly loses its *bios*; but it is quite plain that a new *bios* and a new individuality have made their appearance in the new complicated molecule.

A single molecule may contain atoms in number from 2 or 3 up to 300 or 400.

The highly compound molecule of the carbon product has, therefore, not only a peculiar *bios* of its own, it is full of constituent *bioi*, and probably reaches the highest form of individuality capable of being possessed by a molecule.

There are, it may be, seventy kinds of atoms; but the number and variety of molecules exceed all computation or conception.

It is one of Nature's ways to multiply individuals immeasurably in excess of the kinds of elementary constituents. It is so amongst the highest known individuals, the members of the animal and vegetable kingdoms. There are frequently more living individuals in a wayside pool of water than there are diverse kinds of animals and plants known in the whole world.

We may now proceed to consider the combination of molecules in the simplest organism—the amœba. The still more primitive moneron, if not wholly a hypothetical animal, is very unfamiliar to us in this country; but most of us have seen an amœba.

The size of the amœba, or of the most minute organism made visible by the microscope, is such as to indicate that it consists of an immense number of molecules; and the character of its matter shows that these molecules are highly compound, being individuals themselves, and containing hosts of *bioi* belonging to molecules of a lower rank, or to atoms. Yet the amœba is an individual, and has a life unit of its own. Wondrous indeed is the succession of life within life, in the ascending series which is here indicated; at the summit being the life unit of the amœba, the lowest known animalcule. Yet here, apparently, we may detect a missing term—an indication of that hiatus which has been supposed to mark the distinction between living and lifeless matter. We have seen some reason for holding that no matter is lifeless. There is an ascending progress from the *bios* of an atom to that of such a molecule as  $H_2O$ , and thence to that of the highly compound molecule, a little world in itself; and yet it must be admitted that the series scarcely seem to lead up without a break to life as found in the amœba.

Biologists, who acknowledge a physical basis of life, may find in protoplasm a link between lifeless and living matter. But protoplasm is altogether on the living side; for no one ever saw an example of general

protoplasm, but only the protoplasm of some special living thing.

The first appearance of life has been regarded as unquestionably involving a break in the continuity of Nature. Mr. Darwin writes: "It is mere rubbish thinking of the origin of life; one might as well think of the origin of matter." (*Life*, Vol. III, p. 18.) But the individuality and periodicity of the atoms, on which the *bios* theory rests, was not established when Mr. Darwin wrote, *i.e.*, in 1863.

The generation of a molecule from the combination of atoms, *mechanically considered*, is a break in continuity, and the *bios* theory has been interposed, not to explain the phenomenon, but because a process, somewhat analogous, is general in the animal and vegetable world.

On the basis of mechanics, the old break in continuity at the origin of life still remains, and will remain; and it seems to me that Evolutionists have to choose between discontinuity and the recognition of a universal principle of life, which may be regarded not as mechanical, but as inherent in the primordial atom, and inherited in the molecule, in the lowest organism, and in the man, so far as they are individuals.

Perhaps no better place than this may be found for a reference to certain cognate difficulties.

I. Wishing to profit by a great example, I may here refer to a weighty discrepancy between chemical combination and fertilization. The molecule, once formed, remains unaltered; the organism never ceases to undergo changes during the whole cycle of its existence. Perhaps, however, it may not be strictly accurate to say the molecule remains unaltered, for its environments are ever inconstant as the ages run; and very low organic life partakes almost of molecular uniformity. Mr. Ruskin points out that—"far above, among the mountains, the silver lichen-spots rest, star-like, on the stone; and the gathering orange-stain upon the edge of yonder western peak reflects the sunsets of a thousand years.—*Modern Painters*."

To have any meaning worth contending for, the term *bios* must imply a certain amount of spontaneity. If, therefore, an atom possess a *bios*, it is difficult to conceive of the entire constancy of its behavior.

Yes, if the *bios* of an atom must in all its properties resemble the *bios* in the higher forms of life. This great difficulty I must attempt to meet.

Life then, seems to me to be one of Nature's agents found in vast ascending series, the extreme terms of which are hidden. Take, for example, the most intense cold ever produced—that attending the vaporization of liquefied hydrogen. There is no such thing as cold; it is a purely negative term. That which is present as temperature in a particle of frozen mercury, is denoted by a very low term in an ascending series, of

which the heat of Sirius is a very high term. To take another instance. Darkness is not an entity, a darkness that may be felt is, really, a very low term in that series of gradations in which light reaches an effulgence which the eye cannot receive.

These series, and there are others, transcend our knowledge at both extremes; yet all the intermediate terms differ only in order and degree. The *bios* in the atom may no more resemble the central *bios* in man than darkness resembles light; yet the *bios* series may be one throughout. It may not be unreasonable to assume that in the gradation by which life advances, from its status in the amœba to its more highly developed form in man, we have just the middle terms only of a life series, corresponding in some measure with the series which we know in heat and light; and that, below the amœba and above the man, the life series extends, we know not how far, the highest and lowest terms having positions in the universe further asunder than the extreme terms in the series for light and heat. If it be thus—spontaneity in the *bios* of the atom may be only such as is adapted for its sphere, and need not affect the constancy of its behavior.

II. It has been claimed that the *bios* theory, if I may be permitted the use of such an expression, is the result of modern researches into the individuality of atoms and molecules. Yet there is probably no subject more perplexing in some of its aspects than individuality.

The Hydra may be divided into a hundred pieces, each of which will develop into a perfect Hydra. Is there a life unit in each of the pieces; but if not, when does it enter?

There are also compound animals, and colonial animals, such as sponges and corals; and compound plants, such as merisporae, in all or any of which it is hard to say what constitutes individuals; even the existence of individuality has been denied.

I would not make light of such difficulties, or exceptions, or denials, for they are certain, when properly treated, to prove instructive. But, after all, individuality stands out in the system of Nature with an overwhelming prominence. Unity, with individuality for its complementary feature, is the chief character of the universe. And the weakest point in the *bios* theory will not, I think, be found in the indefinable character of the individual.

It would weary you if I were to dwell upon the grades of life in the series ascending from the amœba, yet they are of much importance in support of the *bios* theory; and it is hardly possible to appreciate the relations of this theory towards the highest known term in the life series without, at least, a glance at the number and variety of the intermediate terms.

But at all events, we must now pass on to man.

If the inference drawn from the molecule of water,  $H_2O$ , be sound, every atom and molecule in our physical frame is an individual and has its *bios*.

But, beside these, the human body contains many whole systems, consisting of formed and formative matter, arranged in distinct histological constituents. Such are the cells of the various tissues and vessels, the lymphatic bodies, and the corpuscles of the blood.

Each of these may be compared with a complete organism having its molecular *bios* and dominant life unit.

The subject does not require me to enlarge on the countless assemblages of living communities gathered within the empire of the human body.

The point calling for attention is the immensity of the interval between our living constituents, and the human life-unit that is at the head of such an empire.

We seem to be repeating the story of our first pages respecting the atoms and the molecule of water. We saw that in no degree could our knowledge of the atoms enable us to predict the *bios* of the molecule,  $H_2O$ , or the consequences of its multiplication to compose the oceans, seas, rivers and clouds of our world.

The *bios* of the atom may be a term in the same vast series with soul or spirit, and though we must not go down to the primordial atoms and their ways to be *outside* wonderland, yet every other wonder sinks into insignificance before the human *bios*, soul, spirit, or life-unit, in its living kingdom, the physical frame of man.

If it be said—Heredity hath done this. Fully admitted. But if we had toiled upward from the amœba—not through Haeckel's twenty-two stages, but through twenty-two thousand stages—and if we could have seen first one and then another increment, in succession, raising the unit of life to its present human elevation, should we be less impressed with the mighty interval between the life-unit that governs, and the *bios* which subserve, in man?

For the *bios* remain as they were from the beginning, only they are true *bios*, not mere symbols but sources of the hardness, and the fusing point, and the specific gravity, and the elective affinity in the atom of an element; and their peculiarity is this, that ever as they combine, grade above grade, in molecule or organism, there comes in something, not supernatural but supra-mechanical and unforeseen.

It has been thus a thousand times repeated, till on the scene has appeared the life-unit capable of sustaining in Nature the part borne by nations and communities, but chiefly by individuals, constituting the glory of our race.

In conclusion, let me press the final enquiry I have to bring before you—Is it so very wild a speculation that a world which is made up of living constituents should, as an individual, have a *bios* of its own?

I once saw in Venezuela a tree, popularly called Humboldt's tree, which carries a botanic garden on its head, and can shelter an army beneath its branches. It is an individual, and has a *bios*, for it is the product of a single bud or seed by orderly development.

Our world, as a whole, is the result of development, and, as an individual, is a member of a planetary family in which every heavenly body feels where the rest are, and would be missed by them if its place were no longer filled.

Professor Huxley, in his *Critiques and Addresses*, thus writes, p. 309:—"It is a probable hypothesis that what the world is to organisms in general, each organism is to the molecules of which it is composed."

The cold of Neptune in those far-off regions at the limits of our planetary system cannot destroy or even starve the *bios* of its atoms. The heat of the sun leaves the *bios* of the hydrogen atom, and the iron atom, and the sodium atom unaffected in the fierce ragings of the photosphere.

Need we stay our enquiry at this point? The universe has systems as countless as the atoms in our globe, and there is sympathy between them, for they move together and life is everywhere.

May not the universe itself have a *bios*, a central life-unit, as far transcending the whole cosmos of gravitating bodies as the human life-unit exceeds, in noble capacities, the living cells, and vessels, and corpuscles of our physical frame?

We are, hereditarily, in matters relating to the inner life, so disinclined to receive grave instruction from Nature, that even if the *bios* theory and its inferences could be rendered far more clearly valid than they are shewn to be, nothing more seems possible at present than their extremely limited acceptance. Yet the train of thought to which we have been led, culminating in a single, central, supreme, sympathising and sustaining life—suggests, feebly indeed, but, it may be, not falsely, something of the anarchy of Polytheism, with its discordant government; of the vagueness of Pantheism, with diffused life everywhere, and true life not anywhere; of the presumption of Positivism, in assuming that the laws of Nature, as known in 1888, are sufficient for all that is needed, or indeed possible, to be known; of the needless reserve of Agnosticism, (for how much do Agnostics expect to know of the supreme life of the universe, before they are content to admit that they know anything at all?); of the delusiveness of rigid Determinism, seeing that some degree of spontaneity, sufficient for its sphere, lies within the atom at the very base of all.

I doubt not that many wise and noble minds have found refuge in all these, as also in other and greater "phases of faith," and have thought them to be final;

but faith cannot be stereotyped whilst knowledge is progressive.

Lastly, if my paper be said to be an attempt at a forensic treatment of a scientific subject, may it not be replied that in the true relation between the life-unit in man and the Supreme Life-unit are bound up verities which will not yield themselves to be expressed in scientific terms? Such constituents in man's idiosyncrasy are his affections, emotions, passions; his love, hope, veneration. For all these a higher sympathy is needed than can be found in the logic of science. Even if by scientific terms an infinite force, or power, or intelligence, could be represented, the thought conveyed would indeed be amazing and sublime, but man, after all, might be left with the feeling of being absolutely without a friend.

In reading the life of Darwin (Vol. III), I have been much interested with his strong regard for the theory of Pangenesis, his own child he calls it; and he seems to have fondly clung to it till persuaded by his friends Lyell, Hooker, Huxley, and Asa Gray, to give it up as a speculation likely to damage his chief work on the *Origin of Species*.

From its first appearance I was deeply impressed by Pangenesis, and, besides advocating a discussion upon it at the Glasgow Meeting of the British Association, I read a paper upon the subject to the Liverpool Naturalists' Field Club for 1868 (*vide Proceedings*). If Mr. Darwin had known what is now known of the individuality of the atoms; far more, if he could have seen in Nature sufficient reason for assigning to an atom a place in the lowest term of the life series, it is probable that nothing would have induced him to give up his cherished hypothesis of Pangenesis. The enquiry how the *bios* theory and Pangenesis afford mutual confirmation must be postponed for the present. Darwin writes to J. D. Hooker, 1868:—"You will think me very self-sufficient when I declare that I feel *sure* if Pangenesis is now still-born it will, thank God, at some future time reappear, begotten by some other father, and christened by some other name."—*Life of Darwin*, Vol. III, p. 78.

I have now only to add that in writing of the "*bios* theory," as if it held an acknowledged place, a sense of crudity has oppressed me, as, I fear, it may also have occurred to some of my friends. The avoidance of intolerable circumlocution may be my apology. The theory, taken by itself, seems to propose that we may derive some apprehension of the Supreme Life from the life of the atom, by a process of working from the circumference towards the centre. Admitted. But the theory is not to be taken by itself, and I venture to submit that it is not for us to begin with working from the centre; otherwise, our centre might be a mere irrational creation of superstition and im-

agination, as have been so many centres around which hosts of devout worshippers have been, and still are, assembled.

In early days, most of us were carefully taught the omnipresence of the Supreme; and I know not any thought more awe-constraining than the recognition of the presence of One, unseen, to whom the darkness and the light are both alike. Perhaps such a submission in religion to impressions of high reference towards an Unseen Eternal may be a very special need of our day. Yet I cannot agree with an aphorism delivered by Goethe, and twice quoted by the late Matthew Arnold in a recent number of the *Nineteenth Century*—

"The thrill of awe is the best thing humanity has."

Not so. The rarest, perhaps, but not the best. The spirit of alliance—call it love if you will—does most of the good work that is done upon earth.

The character of the material aspect of the cosmos appears to be individuality, segregation, separation. The character of the life aspect of the cosmos is combination, or the spirit of alliance, which, in man, is the inner angel that prompts him to do well for the sake of those he loves. But not even an atom lives for itself alone.

#### PLANTATION FOLK-LORE.\*

L. J. VANCE.

'Buh Alligator nebber does trubble Buh Mash-hen an eh chillen,' so says the negro Æsop, beginning a tale which we happened to read first in Mr. Jones's collection of "Negro Myths." And why? In reply, Old Daddy Jack goes on to tell a fable as ancient as Mrs. Malaprop's celebrated 'Allegory on the Nile'; an abridged account of which may be given in the exact language of the aged negro:

'One time Buh Alligator, him been er eat crab. Him bin had one teet wuh hab hole in um. Dat teet duh hot um berry bad. Wen eh der eat dem crab, one er de claw fastne in him rotten teet, an hot um so bad eh mek um holler. Buh Mash-hen pass by. Buh Alligator hail um an tell um wuh happne, an eh bague um fuh pull de ting out wid eh bill. Buh Mash-hen eh fade fur trus eh head between Buh Alligator jaw. But Buh Alligator schway to Buh Mash-hen dat ef eh would bleege um an pick de ting out eh would be fren teu um an eh fambly all dem life.

'Wen Buh Mash-hen see Buh Alligator dub bague so harde, eh tek pity on um, an eh pit eh head in eh mouf an eh pull out de crab-claw wid eh bill. Buh Alligator him keep eh wud. Ebber sence Buh Mash-hen kin walk bout de mash an de ribber, an buil nes, an ketch fiddler an schimp all round Buh Alligator an eh yent try fuh bodder um.'

Here, then, in Georgia, we have the details of a story which is familiar to every reader of Æsop. In the Greek fable it is the crane that pulls out a bone which had stuck in the wolf's throat. However, this is only one story out of a hundred which has been carried across the Atlantic ocean, and at last found a dwelling-place by the fireside in the negro's slowly cabin.

In number 23 of THE OPEN COURT for January, 1888, we had occasion to briefly refer to the existence of this class of stories (animal fables) among the Southern negroes. It does not seem to have occurred to any one 'befo' de wah' to write down the stories told by plantation dorkies. The earliest notice of negro fables, so far as I am aware, was by a writer in the *Riverside Magazine* for November, 1868, and March, 1869. We find, after that, a few stray stories appearing almost by suzerainty in papers (*New York Independent*, September 2, 1875,) and in periodicals (*Lippincott's Magazine*, Vol. 6, and also for December, 1877). Little was done to secure the scientific satisfaction of curiosity (as Mr. Lang would call it) about negro legends, till Joel Chandler Harris made his noteworthy collection of over thirty plantation stories under the name of "Uncle Remus," (1881). About this time Mr. Herbert H. Smith had collected in South America a number of Indian myths for publication in his book, "Brazil, the Amazons, and the Coast," the proof-sheets of which he kindly sent to the author of 'Nights with Uncle Remus.' Mr. Harris noted, with considerable surprise, that a number of stories in his collection were almost identical with stories collected by Mr. Smith, and also some stories collected by the late Prof. C. F. Hartt. ("Amazonian Tortoise Myths.") Very naturally Mr. Harris inquired (see preface to 'Uncle Remus'), 'When did the Negro come into contact with the tribes of South America?' In the *Popular Science Monthly*, April, 1881, that acute and accomplished student of folk-lore, Professor Crane of Cornell, set about to answer the question. He accounted for the remarkable similarity by holding that a large stock of myths and tales had been originally brought from Africa by the Negroes, and that the Indians visited by Prof. Hartt and Mr. Smith had heard these stories from African slaves in Brazil. He went further, and pointed out that, by far a greater portion of 'Uncle Remus's fables were more or less similar to the *Märchen*, or *contes*, or household tales of modern European peasantry. In some cases the negro story-teller had directly borrowed from Æsop and La Fontaine, "adapting" (like a French play) the story to local circumstances and to local scenery. Such is the place of negro tales in the world's folk-lore. The question, as to how these stories came to be so widely diffused all over the world, may be left unanswered for the moment.

\*Negro Myths from the Georgia coast, told in the Vernacular. By Charles C. Jones, Jr., Boston: 1888. Houghton, Mifflin & Co.

We have now to examine a collection of "Negro Myths from the Georgia Coast." In his book, Mr. Jones has brought together some fifty-seven negro myths and fables of very unequal value. Some of them do not properly belong in a collection of native negro lore, others are simply variations of familiar and time-worn themes; others, again, are really genuine contributions to the comparative study of American folk-lore. The stories to which Mr. Jones now acts as introducer were current on the Georgia coast. Yet, they do not differ much from the stories found by Mr. Harris in Middle Georgia. There is, however, a noticeable difference between the lingo of the negro on the coast and his sable brother in the interior. Mr. Jones has succeeded in noting down some of the queer turns of darky expression, and the reader would do well to go over the glossary, which has thoughtfully been added to the book. We doubt if any writer, save and except Mr. Harris of course, has been more successful than Mr. Jones in catching the sound and color of Negro-English, which is so racy and piquant as mouthed by a "New Nigger."\*

There is one striking peculiarity in these "Negro Myths." The *dramatis personæ* are animals. They are all dignified with the title of *Buh* (or *Brer*) which is generally supposed to be an abbreviation of the word 'Brother.' With the exception of the 'buckra' (white) man, who is introduced now and then in a perfunctory sort of a way, these myths have scarcely one human figure to show. Buh Elephant, Buh Lion, Buh Tiger, Buh Wolf, and Buh Rabbit, go and come, act and talk, in such a way as to out-Æsop Æsop.

Clearly, then, these negro fables take us back to a time when beasts spoke as never man spake before. "Le temps où les bêtes parlaient," says Gérard de Rialle, "est sans contredit la période fétichique." Mr. Tyler has adduced an immense mass of evidence to show that there is a stage of human intellectual development in which the savage draws no psychical distinction between man and beast.† (Primitive Culture, I, pp. 167-169.) Or, to quote De Rialle again: "Pour le fétichiste, l'animal se comporte comme l'homme; il est doué de la parole, il chasse, il pêche comme lui, il lui arrive les mêmes aventures. Tout, en un mot, est confondu."‡ People in this stage of primitive culture naturally tell tales in which beasts, and birds, and fishes do most wonderful things, and in which human forms are disguised like the ass in the Peau d'Ane. To the ear of the untutored negro the animals certainly seem to talk.

"I doom-er-ker-kum-mier-ker! I doom-er-ker-kum-mer-ker!"

"What is that?"

"Dat," says Uncle Remus to his astonished listener,

"Dat's Tarry pin talk. W'en you git ole ez me—w'en you see w'at I sees, en year w'at I years," continued the old man, "de creeturs dat you can't talk wid 'll be mighty skase,—dey will dat."

I think that the *conversations* between Brer Terray pin and Brer Frog in "Uncle Remus" would have delighted Sydney Smith who used to say that 'if lions would meet and growl out their observations to each other,' they might have better manners. Again, closely connected with the negro belief in feticism and anthropomorphism is the belief in "sperits," "cunjur" men, and supernatural beings in general. We may take the following dialogue from Mr. Jones's "Negro Myths." On one occasion, the author asked an old negro, called July, whether he believed in ghosts and could see spirits (loc. cit., p. 163). "Yes, Massa," was his reply, "me kin shum."

How do they look? "Same luk wen dem bin live, ceptin dem look lucker shadder, an dem walk backwuds, an dem face tun backwud, an de heel teh eh foot day way eh toe order be. Dem dont tetch de groun wid dem foot, but dem sorter dis skim pon topper de grass." Then July goes on to describe the kind of "cloze" worn by the "sperits." There is not a particle of doubt but that July knows a spirit when he sees one. "Me kin see dem dist es plain as me kin see you now." But it is not necessary to consider further the "sperits," which July, "like an exorcist, has conjured up."

With regard to the negro belief in magic and sorcery the case is not essentially different. "The potency of charms and philters was freely admitted." Again, we learn that the fabrication of Feticiches and their sale were monopolized by old negro women—conjurers as Mr. Jones calls them—"who derived considerable gain from this calling." Thus, "the ordinary Feticich consisted of a bunch of rusty nails, bits of red flannel, and pieces of brier-root, tied together with a cotton string." So too, "a toad's foot, a snake's tooth, a rabbit's tail, or a snail's shell," was sometimes used. According to Mr. Jones, the interference of the 'cunjur' man frequently gave rise to disturbances and promoted disquietude on the plantation. Many minor negro beliefs might be mentioned, such as the common faith in signs and omens, in lucky and unlucky days, in methods of work, and in colors of dress or costume. We find the belief that the plantation-witch has the power to vex horses and cattle (cf. "The Plantation Witch in Uncle Remus, p. 131").

"This is that very Mab  
That plats the manes of horses in the night,  
And bakes the elf-locks in foul sluttish hairs  
Which, once unangled, much misfortune bodes."

Enough has been said, I think, to show that the mental status of the negro is truly mirrored in his animal fables. We can readily see why the negro has such an immense advantage over us as a story-teller. He can

\* "A negro fresh from Africa." See Mr. Jones's glossary.

† See also Sir J. Lubbock's "Origin of Civilization," pp. 33-35, for additional evidence.

‡ La Mythologie Comparée, p. 101.

introduce beasts and birds, speaking in human fashion, with less compunction and less hesitation than our own Hawthorne felt in introducing the Marble Faun. Indeed, among fable-making negroes the powers of a witch are far more real than those possessed by "She," and to them the magic of the "cunjur" man is far more than that of the celebrated "Dr. Jekyll." Let anyone hear, (as we have heard,) the old myth-making darky tell of the wonderful things he has seen, of the "sperits" he has met, of the witches who fly in the air and who walk at midnight, of the conjurers who can control storm and sunshine, and who can work miracles—let him hear these things, then he will understand better than ever before, what stuff myths and fables are made of. He will readily believe that negro fables of Buh Terrappin, Buh Rabbit, Buh Fox, Buh Elephant, and all the rest of the Buhs, would naturally spring out of a condition of human belief and human intellect in which the metamorphoses of men into animals, and the agencies of magic and of spirits are regarded as possible incidents of daily human life. In other words, the raw materials of negro myths are to be found in that state of savagery where "shape-shifting," miraculous powers, Totemism, and Sabæism are accepted as an every day and working belief.

Now, be it observed the materials of comparative mythology or Folk-lore are not all of the same make or kind. Mr. Lang has divided the materials of mythology into two classes: "Nature Myths," and *Märchen*. The first class includes all those myths which explain the facts of the visible universe. The second class includes all those popular tales, or *Märchen* which, as far as can be discovered, have no obvious explanatory element.\*

In briefly examining "Nature Myths," we observe that they attempt to answer some question about Nature. "These myths range," says Mr. Lang, "from tales about heaven, day, night, the sun, and the stars, to tales accounting for the red breast of the ousel, the habits of the quail, the spots and stripes of wild beasts, the formation of rocks and stones, the foliage of trees, the shapes of plants. In a sense these myths are the science of savages; in a sense they are their sacred history; in a sense they are their fiction and romance."† What are the stars? According to the Greek myth the star called the *Bear* was once a woman, the daughter of Lycaon, King of Arcadia; while the seven stars of Pleiad were seven maidens, daughters of the giant Atlas. Our North American Indians, as Schoolcraft says, hold many of the stars "to be transformed adventurers." The Iowas "believed the stars to be sort of living creatures." Thus, where we see a 'Man in the Moon,' the *Èskimo* sees a girl, who is fleeing

from her cruel brother, the sun, because he disfigured her face. Why has the woodpecker red feathers on its head? Because the bird told Monabozho (the chief deity of the Algonkin tribes), when engaged in mortal combat with a great Manitou (or spirit), the spot where the latter, like Achilles, was vulnerable, and for reward had his head rubbed with the blood of the slain Manitou. Why is the Bear so fat? Because Monabozho killed a great fish, and with its oil made a small pond. He invited all the birds of the air, and the beasts of the field, decreeing that the fatness of each would depend upon the order in which they arrived at the feast. The bear "got there" first. Oddly enough the myth says that the hare arrived very late to the banquet, and that is the reason why he is so thin. Why is the bear stumpy-tailed? The Iroquois story is; that the fox induced the ancestral bear to put his tail in a hole in the ice, where it froze fast, and the bear had to pull his tail off to get away.\*

Such tales have survived in Negro folk-lore. To bring out this into clearer light, we may give the Negro version of the reason why Buh Rabbit has no tail, and also why Buh Elephant's ears always hang down. Mr. Jones gives the version of the first-named myth as follows:—Buh Bear had a fine well of water to which Buh Rabbit helped himself without asking. But Buh Bear took a big crawfish and dropped it into the well. So the next time Buh Rabbit came to get water the crawfish grabbed him by the tail, and in pulling away his tail came off. "An dat de way Buh Rabbit come fuh loss eh tail." (Cf. Negro Myths, p. 91.)

Did you ever notice that the elephant's ears always hang down? Do you know how that came about? If you do not, let me tell you:—One day when Buh Elephant was out hunting he stepped upon a nest containing Buh Rabbit's children. Buh Rabbit came home and found "eh chillem squash flat." He could not get any satisfaction out of Buh Elephant, so lays a plan "fuh git eeben" with him. One day while Buh Elephant was sleeping Buh Rabbit started a great fire about his ears. Now, 'befo de fire done out eh bun de hinge er all two eh yez (ears) so eh couldn't liff uny up no mo. An dat de reason huccum Buh Elephant hab flop yez tel ter-day' (p. 93).

"Dat de reason." In this way Negro philosophy seeks to satisfy the curiosity of the human mind. The following nature myths are simply guesses at knowledge by people in a state of ignorance. Why does Buh Alligator never sleep far from the river banks? Why does Buh Fowl-Hawk like chickens? Why is Buh Turkey Buzzard afraid of the crab? The answer is that, Buh Alligator never sleeps far from the river bank because one day Buh Rabbit treated him to a

\* Myths, Ritual and Religion, vol. II, p. 289.

† Loc. cit. I, p. 124.

\* See No. 23 of THE OPEN COURT for different versions.

big bonfire while he was sleeping in the marsh, and he barely had time to reach the bank in order to save his life. Buh Fowl-Hawk likes chickens, because Buh Rooster, in order to play a joke, told him that if he would watch the Sun, and catch him in bed, he would keep him in victuals. When Buh Hawk finds out the trick he made up his mind that hereafter he would find victuals by taking Buh Rooster's children. Buh Turkey Buzzard is afraid of the Crab, because one day Buh Buzzard was so greedy as to take dead fish from the Crab, but the latter got hold of the Buzzard's leg and almost drowned him before he let loose.

This class of Negro myths, like those of the Greeks and the Indians, give a "reason why" for the existence of some aspect in Nature. Such tales are the natural outcome of those "obstinate questionings,"—the outcome of a desire to *know*. "The Indians," said Schoolcraft, "conveyed instruction—moral, mechanical and religious—through traditionary fictions and tales" (*Algonic Researches* I, p. 12). There is but little doubt that Aesop's Fables were put together for this main purpose—namely, instruction. As Carlyle says, "Fable may be regarded as the first attempt of Instruction clothing itself in Fancy." Among the lower races of man these tales take a silly, senseless, or absurd form.

Yet, the question might be asked, why bother with these simple, childish fables? What difference is it to us whether Buh Rabbit and Buh Fox are always at sword's points? Why should we be asked to listen to the story of Buh Alligator and his friendship for Buh Mash-hen? What do we care about the likes or dislikes of Buh Fowl-Hawk, and Buh Turkey Buzzard? Surely, these outlandish stories have not the remotest literary value?

It seems to us that the whole answer to these questions has been stated as clearly as possible by Prof. Crane in the first number of the new *Journal of American Folk-Lore*:—

"The widespread interest in popular tales which has produced within the last twenty years an amazing number of collections from all parts of the world, is not wholly due to their intrinsic worth, great though in some cases it may be (notably in the collection of the Grimms, and of Asbjørnsen and Moe), but largely to the fact that they are supposed to possess a scientific value for the comparative mythologist, ethnologist, and student of comparative literature."\*

(To be concluded.)

#### THE MECHANICAL MEMORY OF THE PHONOGRAPH.

Mr. Thomas A. Edison announces in the June number of the *North American Review* that his predictions of ten years ago concerning the phonograph are now fulfilled. "The phonograph," he says, "knows more than we do ourselves. For it will re-

tain a perfect mechanical memory of many things, which we may forget, even though we have said them." The invention of the phonograph, it is to be hoped, will not only benefit mankind in many practical ways, it will also prove of theoretical importance as regards the explanation of the human soul. Mr. Edison's expression that the phonograph is "a perfect mechanical memory" reminds me of a passage in Mr. Hegeler's essay, "The Soul," p. 394 of the *OPEN COURT*. Mr. Hegeler says:

"I had read in an article in the Berlin *Gegenwart* on *The Origin of Reason*, by Noiré, 'Man thinks because he speaks; he has concepts, because he has words;' and how simply does the phonograph record words! That man's brain can record language in as simple a way as the phonograph is undoubtedly one foundation of the progress of man over the animal. I have overcome any hesitancy to pronounce this my opinion (which is likely shared by many others) so positively, by the course our increase of knowledge of the working of the eye has taken. That the eye works like a photographer's camera we learned already at school; that in addition a liquid analogous to the photographer's chemicals was active in the retina, fixing there for a short time pictures thrown on it by the lens of the eye, we learned not many years ago."

The form of the vibrations, the indentations in the tin-foil, Mr. Hegeler would call the soul of the phonograph.

There is no theoretical discovery which will not sooner or later become practically useful, and there is no practical discovery which will not be valuable to theoretical enquiry as serving to explain processes which hitherto we have been unable to understand. By the invention of photography we learned that the eye, the most wonderful organ of the human body, is not only like the *camera obscura* of a photographer, but that it *is* one, indeed. The apparently unexplainable had been explained. And now the invention of the phonograph shows that receiving and retaining sounds in some plastic substance can be effected very easily. There is only one difference between the photographer's plate and the retina, between Mr. Edison's wax cylinders and the auditory nerve: the plate and the wax are what we call dead matter, while our brain-substance is alive and endowed with sensation. The mechanical and chemical process of fixing pictures upon the plate and the retina, and the mechanical process of fixing sounds in the wax and in the gray matter of the auditory nerve and brain are analogous. They are possible through the very same mechanical laws which produce the nodal lines of Chladni.

The importance of Mr. Hegeler's application of the phonograph to explain the process of recording language in our brains is corroborated by a passage in Mr. I. G. Vogt's lately published book: "*Die Geistesthätigkeit des Menschen*." Vogt says:

"Upon the whole, the phonograph affords us an excellent point of vantage for the understanding of the intricate processes here treated of, although like all illustrations, it too is deficient. The

\* *Journal Am. F.-L.*, p. 9.

phonograph, an accidental invention of Edison, consists of a wooden\* cylinder into the surface of which is cut a spiral groove or hollow which continues around the cylinder without a break. Over this grooved surface is wrapped a thin sheet of tin-foil which gives to the whole the appearance of a tin-foil cylinder. In front of the cylinder is placed a so-called mouth-piece, which consists of a thin diaphragm stretched over a ring. In the centre of this diaphragm is fastened a small delicate pencil or metallic style, the point of which rests close upon the tin-foil directly over the groove. The mouth-piece is stationary, whereas the cylinder is fixed so as to revolve and at the same time to move along in the direction of its axis; thus, starting at one end of the spiral groove the style of the mouth-piece may be carried over the entire length of the groove until it reaches the other end of the revolving cylinder. If a person talk or sing into the mouth-piece while the cylinder is being turned about its axis, the sound-waves naturally set the diaphragm into vibration and these vibrations are transmitted through the style to the surface of the cylinder in the form of points or slight indentations of the tin-foil which at the spots touched lies over the hollow made by the groove. In this way, a conversation or a song may be stamped upon the surface of the tin-foil cylinder.

But it is just at this point that the remarkable peculiarity of the phonograph comes in. The conversation or song thus impressed upon the tin-foil may be reproduced at any time, simply by turning the cylinder in the opposite direction over the course traversed. During this process every indentation or mark made upon the tin-foil causes a rapid depression or elevation of the pencil fixed to the mouth-piece; in consequence whereof the diaphragm is set into vibration, and of necessity exactly the same vibrations are induced as caused the original indentations. Exactly the same sound-waves are again produced; and we have before us the phenomenal fact that an exceedingly simple apparatus of mere wood, tin-foil, etc., can talk, sing, and play with a purity of tone which easily enables us to distinguish between the most delicate shades of vocal and instrumental expression. In the reproduction there is a loss in intensity only.

Now we may now apply this phenomenon of the phonograph as a fitting illustration of the point in question. Let us compare the function of the sensory cells to the part acted by the mouth-piece in the phonograph. The vibrations of the diaphragm, the actual soul of the apparatus, clearly represent the trans-formative activity of the sensory cell. In the same manner as the diaphragm receives a spoken word or a song and transmits it to the tin-foil, in a like manner does the sensory cell receive the sensory irritations of the material world, transform them into sense-products or mental images and at the same time transmit these sensory irritation to the cortex or envelope of the brain to be stamped in the memory cells. Furthermore, just as the mouth-piece reproduces anew the sound-waves stamped upon the tin-foil, in the same manner does the sensory cell always reproduce the images corresponding to the sensorial irritations stored in the memory cells, so soon as the memory cells exercise their active function, that is, transmit their irritations to the sensory cell. And last not least, in the same manner that millions of words and melodies may pass through the single pencil of the vibratory diaphragm and millions of words may be reproduced anew through the same medium, in like manner may millions of images be reproduced and made perceptible through the one sensory cell, the point where consciousness is located."

Without going into the details of Mr. Vogt's explanation, we shall point out only one thing of which we can be certain, viz., that our most subtle sensa-

tions are mechanically explainable, and that there is no doubt but that physiology will solve one problem after the other until a comprehensive solution be attained. The images and words recorded in the memory of our brains are mechanically produced photographs and phonograms.

But we can go one step further on the way which has been pointed out by Mr. Hegeler. Our ideas, viz., our conceptions of abstracts or generalizations, are also produced mechanically. We find the fittest explanation of this process in the composite photograph. Mr. Hegeler says on this subject in a foot-note on page 393 of the OPEN COURT:

"I am told that what I call an abstraction is usually called a generalization, but abstraction is the more correct word. If a generalization is made, many things having something in common are put together and what they have in common is specified in words. It is then forgotten that what they do not have in common disappears in the generalization. The same takes place in Galton's composite photographs of the members of a family. Only that remains of the several faces what they have in common. This implies that the composite photograph is entirely contained in each of the single photographs of each member, each is the complete composite with additions. So in reality the composite photograph is an abstraction—a part—of each of the single photographs.

"If of a bronzestatue and a bronze cube and a bronze sphere I make the generalization *bronze*, I in reality make an abstraction—the bronze is in each of them—the form is not noticed. If of the words bronze, lead, iron, and copper I make the generalization *metal*, I again make an abstraction. What the word metal implies is in all of them; the other characteristics are omitted. If again of the words metal, wood, water and air I make the so-called generalization *matter*, I again in reality make an abstraction, what is meant by matter is completely found in each of them." •

The photographs of many horses are recorded on the retina of the eye and registered somewhere in the living memory cells of the brain. All together form a composite picture, which is our abstract conception of a horse. By this mechanical process, in the most simple way, all the complicated structures of human ideas are built up. How wonderful is the simplicity of the human mind notwithstanding all its apparent complexity.

P. G.

#### MY PHILOSOPHY.

LOUIS BELTROSE, JR.

I saw good men at strife because a creed

That half held sacred, half had learned to shun;

And while their bodies rotted in the sun

I thought;—I thought of all the strength we need

To war with nature;—how men's interests, freed

From misconception, still must ever run

Athwart; and ere my pondering was done

I heard from lips of wounds that seemed to plead,—

"Teach fact and judge not. Let the world have light.

Show all to all, that all men's eyes may see

The best and worst; that stamped on all men's sight,

\*The details of construction as now perfected by Mr. Edison and described in the *North American Review* for June, differ from those of the models exhibited in 1878. Instead of tin-foil a cylinder of wax is now used for receiving the record of sound pulsations.

Some sharp, some dull, the selfsame star may be  
The guide for all. Facts and not creeds unite."

Which forms the whole of my philosophy.

PARIS, during the Commune.

## CORRESPONDENCE.

### THE PHYSICAL BASIS OF MIND.

Number 40 of THE OPEN COURT contains, in answer to Prof. Cope's essay "What Mind is," the following editorial passage:

"But we are at a loss how to conform this monistic view with other propositions which must be considered as unequivocal dualism. Although consciousness, it is maintained, does not exist apart from energy and matter, Prof. Cope objects to the view 'that with the disappearance of protoplasm from the universe, mind would disappear; and that the development and extension of mind depend on the production and distribution of protoplasm.' Protoplasm, it must be mentioned, means the living substance which is the basis of organic life. On other planets may be found other kinds of protoplasm, but we do not expect to find mind independent of living substance. Moreover, when Prof. Cope speaks of 'a primitive or supreme person,' he can only mean a supernatural God, whom, as I judge from other publications of his, he considers as absolute mind. With such contradictory statements it is natural that Prof. Cope ends in occultism, etc."

In reference to this passage Prof. Cope writes the following letter to the Editor:

WASHINGTON, D. C., June 6, 1888.

DR. CARUS. *My Dear Sir:*—I have the proof of your criticism on my article, "What Mind is." I reply at once that you have misapprehended me on one point, that is as to the physical basis of mind outside of protoplasm. By denying that mind other than terrestrial human mind is not a property of protoplasm, I do not divorce it from a physical basis or introduce an inconsistent dualistic idea into the proposition. I hold on the contrary that according to the pointings of the "Doctrine of the Unspecialized" there is probably physical basis of mind not protoplasm, which may exist in other places in the Universe, and which may have generally similar capacities to protoplasm under different conditions of temperature, etc. It is not likely that this small planet on which we live is the only habitat of consciousness.

This explanation will, I hope, relieve me of the charge of inconsistency or of self-contradictoriness. Very truly yours,  
E. D. COPE.

### MATTER AND REALITY.

PHILADELPHIA, May 27, 1888.

To the Editor of THE OPEN COURT:

In replying to the letter of Mr. L. A. Fisher (the points of which letter I confess seem to me to be well taken) you say in one place: "We believe that spirit, life, feeling, are qualities of reality which are not included in matter and which cannot be explained from matter either"; and in another place you say: "From the standpoint of monism we maintain that the elementary conditions of life, especially those of feeling, must be inherent in matter." To my untutored\* mind these two statements of belief involve a contradiction. I beg leave also to heartily concur in the views expressed by Mr. Otto Weissstein in his letter in the same Number of THE OPEN COURT, and to say that if the Editor of THE OPEN COURT in his interpretation of "religion" includes the idea of worship I differ from him radically. Respectfully,

C. F. WOODWARD.

[The writer of this letter sees a contradiction where there is none. We present two similar statements:

\*We beg our correspondents to omit words like "untutored." Answers to questions, and replies to criticisms shall be given as much as our space allows if they are properly and intelligently presented.

"The notion of fire is not included in the concept wood, and cannot be explained from wood either," and at the same time we maintain that "the conditions of burning, viz., inflammability must be a quality inherent in wood."

Where is the contradiction? Can I explain fire (which is a process, or a mode of motion) from wood—or from wood and the oxygen of the surrounding air. Wood and air are matter, and their conceptions do not contain any notion of a process or of a mode of motion. Fire is as different from wood as life is from matter. But wood (if dry) is combustible, which means, it has qualities which will under proper conditions make it burn. Similarly we declare that matter has qualities which under proper conditions produce feeling, consciousness, spirit, psychical life, etc. The elementary conditions of feeling are inherent in matter.

Materialism identifies *matter* and *reality*, and concludes that all is matter and everything must be explainable from matter. However, matter is only one part of reality. The notion of matter is abstracted from reality in so far as surrounding objects materially affect our senses. We understand by matter what is material in things, and non-material qualities (e. g. form) are explicitly excluded from the term matter.

Prof. Max Müller says in his latest publication\* on p. 86:

"From this point of view I call materialism no more than a grammatical blunder," and on p. 87, "Matter and spirit are correlative, they are not interchangeable terms." "And the same blunder underlies Spiritualism."

For further information we refer to the passages quoted from Max Müller's lectures (OPEN COURT, p. p. 366 and 367), to our statement on Matter and Form (OPEN COURT, p. 933), and to the Editorial "Idealism, Realism and Monism."

What we think of worship has been stated on p. 890 of THE OPEN COURT.]

### NOTES.

In the issue of next week the OPEN COURT will discuss editorially the Field-Ingersoll Controversy.

"The Popular Science Monthly" for July contains the concluding essay of the remarkable series on "Darwinism and the Christian Faith."

In *Wide Awake* for June, Edward Everett Hall begins "The Story of Boston Common," and tells of the Massachusetts Witches of the Seventeenth Century, delightfully treating the historic incidents with which this old park is associated.

VOLAPÜK, 'the universal language' which is spoken nowhere, is beginning to be studied more and more in America. The publishing house of C. N. Caspar, 437 East Water Street, Milwaukee, is preparing an English Volapük Dictionary.

Herbert Spencer had to print most of his publications at his own expense; Schopenhauer's publisher disposed so slowly of his books that he thought of sending them as rubbish to the paper-mills, while Zola received \$20,000 on an average for each of his novels.

Upon June 28th, the Chicago Waifs' Mission will afford an opportunity to persons interested in the homeless children of Chicago, to contribute to the movement by taking part in the annual picnic which has been planned for that date. Many a bright boy or girl may be rescued from a wretched fate by the timely help of this mission. Tickets may be obtained for \$1.00 on application to Superintendent T. E. Daniels, Calvary Armory, Telephone No. 2337.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XVII.—Continued.

This was too much; Laura turned her head sharply toward the Doctor. For a moment he saw two flashing eyes, and heard the contemptuous words: "I am no cat." Again her lips were compressed, and she clenched her hand convulsively.

Fritz reflected with astonishment whether gloves that wrinkle could ever have been considered a characteristic sign of our domestic animal. He thought the remark incongruous. "What a pity she is so whimsical!" After a time he began again: "I fear you will feel the draught; shall I close the window?"

"Not at all," answered Laura, with icy coldness.

"Do you know what the baby is to be called?" continued the doctor.

"He is to be called Fritz," returned Laura; and for the second time a flaming look of anger met his spectacles, then she turned away again.

Ah! in spite of the lightning that flashed from her eyes, the Doctor could not deny but that she was at this moment wonderfully lovely. She also felt obliged to say something now, and began, over her shoulder:—

"I think the name a very common one."

"It is my own name," said the Doctor; "and as I hear it every day, I must agree with you. It is at least a German name," he added, good humoredly. "It is a pity that they are so much neglected."

"As my name is a foreign one," replied Laura, again over her shoulder, "I have a right to prefer foreign names."

"If she continues like this the whole day," thought Fritz, discouraged, "I shall have a very pleasant time of it, indeed."

"I must sit next him at dinner, and bear the insult," thought she. "Ah! life is terrible."

"They arrived at the house, both glad to find themselves among others. When they entered the room, they hurried to different parts of it; but, of course, being obliged to greet the young mother, they again had to meet. When Laura turned to her godmother, the Doctor also approached from the other side, and the good lady called to mind the day when they had come together to her summer residence, and she could not refrain from exclaiming: "That portends something; you have again come together, dear children."

Laura raised her head proudly, and replied: "Only because you have wished it."

They went to church. The little Fritz tossed about in his godmother's arms, frightened at the baptismal font; but when he was handed over to the tall Fritz, he broke out into an angry cry; and Laura observed with contempt how disconcerted the Doctor was, and

what awkward efforts he made, by raising and lowering his arms, and by his looks, to appease the little squaller, till at last the nurse—a very resolute woman—came to his assistance.

With the approach of sunset the duties of the day became more insupportable. At the christening feast all Laura's most gloomy anticipations were fulfilled, for she was seated beside the Doctor; and, for both, it was a most disagreeable meal, indeed. The Doctor once more ventured to make some advances, hoping to break through her incomprehensible mood, but he might as well have attempted to thaw the ice of a glacier with a lucifer match, for Laura had now become an adept in the expression of social contempt. She conversed exclusively with the father of the child, who sat at her other side, and encouraged by his cheerful gossip she recovered her wonted elasticity of spirit; while Fritz became more silent, and noticeably neglected a pleasing young woman, his left-hand neighbor. But things grew still worse. When the proper time approached, the other godfather, a city councillor, a man of the world and a good speaker, came behind the Doctor's chair, and declared that he could not undertake to bring the christening toast as he was suffering with a headache, which drove away all his thoughts, and that the Doctor must speak in his stead. The possibility of this had never occurred to the Doctor, and it was so unpleasant to him in his present mood that he quietly, but firmly, refused his consent to the proposal. Laura again listened with deep contempt to the discussion between the two gentlemen about an oratorical exercise which was not even to be put in writing. The master of the house also observed it, and a feeling of awkward expectation threw a gloom over the society, which is not calculated to encourage unwilling after-dinner speakers, but rather to depress them, and scatter their thoughts. Just, however, as the Doctor was on the point of performing his duty, Laura, after giving him another cold look, rose and clinked her glass. She was greeted with a loud bravo; and she then said, to the astonishment of herself, and delight of all present: "As the gentlemen sponsors are so little inclined to do their duty, I beg pardon for undertaking what they ought to have done." Thereupon, she bravely proposed and led the toast; it was a bold undertaking, but it was successful, and she was overwhelmed with applause. On the other hand, sarcastic speeches were made against the Doctor by the gentlemen present. Nevertheless, he extricated himself tolerably, the situation being so desperate that it restored to him his powers; nay, he had the impudence to declare that he delayed intentionally, in order to procure for the society the pleasure which all must have experienced in listening to the eloquence of his neighbor. He then made an amusing speech on every pos-

sible subject; and all laughed, but they did not know what he was aiming at, till he adroitly turned it upon the godfathers and godmothers and in particular proposed the health of his charming neighbor who sat beside him. This answered well enough for the other guests, but to Laura it was insufferable mockery and hypocrisy; and when she had to clink glasses with him, she looked so indignantly at him, that he quickly drew back from her.

He now began to show his indifference after his fashion; he talked loudly to his neighbor, and drank many glasses of wine. Laura drew her chair away from him; fearing that he might drink too much, he became an object of annoyance to her, and she gradually relapsed into silence. But the Doctor took no heed of this; again he clinked his glass, and made another speech, which was so comical that it produced the happiest effect on the company. But Laura sat as stiff as a stone image, only casting an occasional stolen glance towards him. After that the Doctor left her side; his chair stood vacant, but, figuratively speaking, the cotton pocket-handkerchief and the small fur gloves still lay upon it, and it seemed quite uneasy under its invisible burden. The Doctor, meanwhile, went about the table, stopping here and there to pay his respects; and wherever he stopped there was laughing and clinking of glasses. When he had finished his round, he approached the host and hostess; and Laura heard them thank him for the merry evening, and praise the gaiety of his spirits.

He then returned to his place; and now he had the impudence to turn to Laura, and, with an expression in which she clearly perceived a sneer, he held out his hand to her under the table, saying, "Let us make peace, naughty godmother; give me your hand." Laura's whole heart revolted, and she exclaimed, "You shall have my hand immediately." She put her hand quickly into her pocket, put on one of the cat's-skin gloves, and scratched him with it on the back of his hand. "There, take what you deserve."

The Doctor felt a sharp pain; he raised his hand, and he perceived it was tattooed with red streaks. Laura threw the glove into his lap, and added: "If I were a man, I would make you feel in another way the insult you have offered me."

The Doctor looked about him; his left-hand neighbor had risen; and on the other side, the master of the house, bending over the table, formed a convenient wall between them and the outer world. He looked in astonishment at the challenge in his lap; it was all incomprehensible to him; he was conscious but of one thing, that Laura, in spite of her passion, was enchantingly beautiful.

He too put his hand into his pocket, and said: "Happily, I am in a position to bind your present of

this morning about the wounds." He pulled out the red and black handkerchief, and began to wind it round his wounded hand; in doing which, it could not fail being seen that the hand had a most uncanny and murderous appearance. When Laura saw the bloody scratches, she was shocked, but she bravely concealed her repentance, saying coldly, "At least it would be better for your hand if you would take my handkerchief as a bandage, instead of that stiff clumsy thing."

"It is your handkerchief," replied the Doctor, sorrowfully.

"This is worst of all," cried Laura, with quivering voice. "You have behaved towards me to-day in a manner that is highly humiliating to me, and I ask you what have I done to deserve such treatment?"

"What have I done to deserve such reproaches?" asked the Doctor, in return. "This morning you sent me this with your compliments.

"I?" cried Laura; "you sent me these cat's paws. But I did not send that handkerchief. My handkerchief had none of the beauty of this colored print—it was only white."

"I may say the same of my gloves; they were not blessed with claws—they were plain kid."

Laura turned to him, anxiously gazing into his face. "Is that true?"

"It is true," said the Doctor, with convincing sincerity; "I know nothing about these gloves."

"Then we are both victims of a deception," cried Laura, confounded. "Oh, forgive me, and forget what has passed." Guessing the state of the case, she continued: "I beg of you to say no more on the subject. Permit me to bind your hand with this handkerchief."

He held out his hand; she stanchd the blood with her handkerchief, and hastily wound it about the scratches.

"It is too small for a bandage," she said, sorrowfully; "we must put your own over it. This has been a disagreeable day, Doctor. Oh, forget it, and do not be angry with me."

The Doctor was by no means inclined to be angry, as might be perceived from the eager conversation into which they now fell. Their hearts were lightened; they vied with each other in their efforts at sincerity; and when the carriage set them down at their own doors, they bade each other a cordial good-night.

The following morning, Mr. Hummel entered Laura's private room, and laid a blue paper upon the table.

"There was a mistake yesterday," he said; "here is what belongs to you."

Laura opened the paper quickly; it contained an embroidered handkerchief.

"I have also sent back the gloves to the Doctor,

with my compliments, informing him that there was a misunderstanding, and that *J.*, your father, Hummel, sent him what was his own."

"Father," cried Laura, going up to him, "this new insult was unnecessary. Upon me you may inflict whatever your hatred to your neighbors prompts you to do, but that you should again wound another after what has passed yesterday, is cruel of you. This handkerchief belongs to the Doctor, and I shall give it him at the first opportunity."

"Exactly," said Hummel; "it is hemmed and embroidered by your own hands. You are responsible for whatever you do now. But you know, and he knows too, how I feel about these exchanges of civilities. If you choose to act contrary to my expressed wishes, you may. I will not consent to our house being upon terms of exchanging presents, either small or great, with the Hahns; and since you, as I hear, often meet the Doctor at our lodgers', it will be as well for you to bear this in mind."

He went out of the room complacently, and left his daughter in revolt against his harsh commands. She had not ventured to contradict him, for he was unusually calm to-day, different from his ordinary blustering manner, and she felt there was a meaning in his words that checked her utterance and sent the blood to her cheeks. It was a stormy morning for her journal.

Mr. Hummel was busy at his office with a consignment of soldiers' caps, when he was disturbed by a knock at the door, and, to his surprise, Fritz Hahn entered. Hummel remained seated with dignity, till his caller had made a respectful bow, then he slowly rose, and began, in a business tone:

"What can I do for you, Doctor? If you need a fine felt hat, as I presume you do, the salesroom is on the floor below."

"I know that," replied the Doctor, politely. "But I am come, in the first place, to thank you for the handkerchief you so kindly selected and sent me as a present yesterday."

"That's pretty good!" said Hummel. "Old Blücher was painted upon it; he is a countryman of mine, and I thought on that account the handkerchief would be acceptable to you."

"Quite right," answered Fritz. "I shall be careful to preserve it as a keepsake. I must, at the same time, add to my thanks the request that you will deliver these gloves to Miss Laura. If a mistake occurred yesterday in the delivery, as you kindly informed me, it was not my fault. As these gloves already belong to your daughter, I, of course, cannot take them back."

"That's better still!" said Hummel, "but you are in error. The gloves do not belong to my daughter; they were bought by you, and have never been seen

by her; and early this morning they were returned to their possessor."

"Pardon me," rejoined Fritz, "if I take your own words as testimony against you; the gloves were yesterday, according to the custom of the country, sent as a present to Miss Laura; you yourself received them from the hands of the messenger, and, by your words, acknowledged them. The gloves, therefore, by your own co-operation, have become the property of the young lady, and I have no claim to them."

"No advocate could put the case in a better light," replied Hummel easily. "There is only one objection to it. These gloves were non-apparent; they were covered with paper and flowers, like frogs in the grass. Had you come to me openly with your gloves, and requested to be allowed to give them to my daughter, I should have told you yesterday what I now say, that I consider you a worthy young man, and that I have no objection to your standing as godfather every day in the year, but I do very much object to your showing my daughter what hereabouts are called attentions. I am not kindly disposed towards your family and, what is more, I do not wish to be; therefore I cannot permit that you should be so towards mine. For what is right for one is fitting for the other."

"I am placed again in the unfortunate predicament of confuting you by your own actions," rejoined the Doctor. "You, yesterday, honored me with a mark of civility. As you have made me a present of a handkerchief, in token of your favor, to which, as I had not stood godfather with you, I had no claim, I also may say that what is right for one is fitting for the other. Therefore you cannot object to my sending these gloves to a member of your family."

Mr. Hummel laughed. "With all respect to you, Doctor, you have forgotten that father and daughter are not quite the same thing. I have no objection that you should occasionally make me a present if you cannot resist the inclination to do so; I shall then consider what I can send you in return; and if you think that these gloves will suit me, I will keep them as a token of reconciliation between us; and if ever we should stand together as godfathers, I shall put them on and exhibit them for your benefit."

"I have delivered them to you as the property of your daughter," replied Fritz, with composure; "how you may dispose of them I cannot decide. You know my wishes."

"Yes, perfectly, Doctor," assented Hummel; "the affair is now settled to the satisfaction of all concerned, and there is an end of it."

"Not quite yet," replied the Doctor. "What now comes is a demand I have upon you. Miss Laura, as godmother with me, prepared and sent me a handkerchief. That handkerchief has not come into my

hands, but I have undoubtedly the right to consider it as my property, and I beg of you most humbly to send it to me."

"Oho!" cried Hummel, the bear beginning to stir within him, "that looks like defiance, and must be met with different language. With my good will you shall not receive the handkerchief; it has been given back to my daughter, and if she presents it to you she will act as a disobedient child, contrary to the commands of her father."

"Then it is my intention to oblige you to recall this prohibition," replied the Doctor, energetically. "Yesterday I accidentally discovered that you exchanged the gloves I sent to Miss Laura for others which must have excited in her the belief that I was an impertinent jester. By such deceitful and injurious treatment of a stranger, even though he were an adversary, you have acted as does not become an honorable man."

Hummel's eyes widened, and he retreated a few steps.

"Zounds!" he growled, "is it possible? Are you your father's son. Are you Fritz Hahn, the young Humboldt? Why you can be as rude as a boor."

"Only where it is necessary," replied Fritz. "In my conduct towards you I have never been deficient in delicacy of feeling; but you have treated me with injustice, and owe me due satisfaction. As an honorable man you must give me this, and my satisfaction will be the handkerchief."

"Enough," interrupted Hummel, raising his hand, "it will all be of no avail. For, between ourselves, I have nothing of what you call delicacy of feeling. If you feel yourself offended by me, I should be very sorry, in so far as I see in you a young man of spirit, who also can be rude. But when, on the other hand, I consider that you are Fritz Hahn, I convince myself that it is quite right that you should feel aggrieved by me. With that you must rest content."

"What you say," replied Fritz, "is not only unconvincing, but unjust. I leave you, therefore, with the feeling that you owe me some reparation; and this feeling is, at all events, more agreeable to me than if I were in your position."

"I see we understand each other in everything," replied Hummel. "Like two business men, we both seek our own advantage. It is agreeable to you to feel that I have injured you, and to me that is a matter of indifference. So let it remain, Doctor; we are at heart, and before all the world, enemies; but for the rest, all respect to you."

The Doctor bowed and left the office.

(To be continued.)

The one thing in the world, of value,  
Is the active soul.—Emerson.

### Three Introductory Lectures

on

## The Science of Thought.

Delivered at the Royal Institution, London, during the month of March, 1887.

First published in THE OPEN COURT of June, July, and August, 1887.

BY F. MAX MÜLLER.

Chicago: 1888.

THE OPEN COURT PUBLISHING COMPANY.

169-175 La Salle Street.

Neatly Bound in Cloth. Price, 75 Cts.

## THE OPEN COURT,

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, President.

DR. PAUL CARUS, Editor.

THE OPEN COURT is devoted to the work of reconciling Religion with Science. The founder and editor have found this conciliation in Monism—to present and defend which is the main object of THE OPEN COURT.

THE OPEN COURT has for contributors the leading thinkers of the old and new world.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social and economic questions.

TERMS, \$2.00 PER YEAR. \$1.00 FOR SIX MONTHS.  
\$0.50 FOR THREE MONTHS. SINGLE COPIES, 10 CTS.

All communications should be addressed to

#### THE ANIMAL SOUL AND THE HUMAN SOUL.

CARUS STERN. In Nos. 37 and 41.

An essay full of fine thought and psychological depth.

#### THE QUESTION OF IMMORTALITY

It is treated in the Editorial of No. 25, "Evolution and Immortality." It is shown that immortality according to the Monistic view is imminent; it is a continuance of ourselves in our children, in our ideas and in the work we have done during life. Rudolf Weyler in his essay "THE PROCESS OF PROGRESS" in No. 24 speaks of death as a mere transition and C. Billups in a letter of No. 25 criticises the wrong notion of a transcendent immortality as taught by Dualism.

#### THE ETHICAL BASIS OF CHARITY.

W. ALEXANDER JOHNSON.

The Editor of *The Republic*, an organ of Organized Charity, Chicago, speaks not only from experience but takes the scientific aspect of this most vital problem. The basis of Charity must not be sought for in the sustenance of a pauper class who would not exist but for charity. The basis of Charity must be sought for in ourselves and our ethical nature. To this truth the principles and methods of doing the work of Charity must conform.

## The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
  2. The Identity of Language and Thought; and
  3. The Simplicity of Thought.
- With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.
- THE OPEN COURT PUBLISHING CO.  
169-175 La Salle Street, Chicago.  
Neatly Bound in Cloth. Price, 75 Cts.

The study of language is of interest to the lawyer as well as the clergyman, the scientist as well as the teacher, and no education is complete without it.

Max Müller says in this most instructive and interesting book:

"Try to reckon without numbers, whether spoken, written, or otherwise marked, and if you succeed in that, I shall admit that it is possible to reason or reckon without words, and that there is in us such a thing, or such a power or faculty, as reason apart from words. \* \* \*

"People do no longer believe in witches nor in ghosts. But the belief in disembodied thought will die very hard. \* \* \*

"As little as we possess a thing called hunger because we are hungry, do we possess a thing called reason because we are rational. Why, then, should we write it with a Capital R, and make a goddess of Reason and worship her, as she was actually worshipped in the streets of Paris? \* \* \*

BLESSED BE DRUDGERY. A sermon, 2c. mailed, Charles H. Kerr & Co., Pub's., Chicago.

# THE OPEN COURT.

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING COMPANY.

CHICAGO, ILL.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE READER will find in THE OPEN COURT an earnest, and, as we believe, a successful effort to conciliate Religion with Science. The work is done with due reverence for the past and with full confidence in a higher future.

THE OPEN COURT unites the deliberation and prudence of conservatism with the radicalism of undaunted progress. While the merits of the old creeds are fully appreciated, their errors are not overlooked. The ultimate consequences of the most radical thought are accepted, but care is taken to avoid the faults of a one-sided view.

## THE QUINTESSENCE OF RELIGION

is shown to be a truth. It is a scientific truth (a reality) which has been and will remain the basis of ethics. The Quintessence of Religion contains all that is good and true, elevating and comforting in the old religions. Superstitious notions are recognized as mere accidental features of which Religion can be purified without harm to the properly religious spirit.

This idea is,

### FEARLESSLY AND WITHOUT RESERVATION OF ANY KIND,

presented in its various scientific aspects and in its deep significance to intellectual and emotional life. It fully grasped, it will be found to satisfy the yearnings of the heart as well as the requirements of the intellect.

Facts which seem to bear unfavorably on this solution of the religious problem are not shunned, but openly faced. Criticisms have been welcome, and will always receive due attention. The severest criticism, we trust, will serve only to elucidate the truth of the main idea propounded in THE OPEN COURT.

THE OPEN COURT holds that Religion and Science, rightly understood, do not contradict each other. The apparent divergencies have arisen from the false dualistic conceptions of world and life; and the Conciliation of Religion with Science is to be found in *Monism*—to present and defend which is the main object of THE OPEN COURT.

*Monism* is that view which recognizes the Oneness of All-Existence.

As a Philosophy, *Monism* is the basis of modern science. It teaches that truth is one and the same. One truth can not contradict another truth. Cognition must agree with facts and be free from self-contradiction, constituting a clear and systematic conception of Reality.

As a Religion, *Monism* teaches that the individual is a part of the whole. The individual must conform to the laws of the All in order not only to live, but also to lead a moral life—a life that is worth living.

The religion of *Monism* thus becomes the scientific basis of Ethics which regulates the relations of the individual to his fellow-beings as well as to the cosmic laws of the All.

The work of THE OPEN COURT covers a wide field of study and intellectual enjoyment, embracing the whole domain of Moral Philosophy, of Religion, Social Economics and Science. While speculative thought is allowed its proper place in the search after truth, all claims are brought as close as possible to the test of scientific analysis and proof. The articles have been selected carefully from a large number contributed by some of the most eminent men known to the literary world of America and Europe. The translations of the German and French authors have been made by competent scholars, and these translations form a valuable connecting link between the latest philosophic thought of the Old World and the New.

## RECENT CONTRIBUTIONS TO "THE OPEN COURT."

### THE PSYCHIC LIFE OF MICRO-ORGANISMS.

ALFRED BINET. In Nos. 49, 50, 51, 52, 56, 57, and 58.

Mr. Alfred Binet, the collaborator of Ribot and Féré, and one of the most eminent representatives of the French School of Psychology, has presented in this series of articles the results of the most recent investigation into microscopic life. Every phenomenon that the improved methods of microscopic research have shown to be indicative of an exercise of intelligence, will, or feeling, in proto-organisms is fully discussed and analyzed. Mr. Binet has added much by these articles to the psychology of the microscopic world; he has opposed many theories, confirmed others, and advanced many conclusions of his own. The correspondence elicited in France by these essays is published in No. 67.

The essays will be published during the month of January, 1899, in book-form: parts that have not appeared in THE OPEN COURT, with new explanatory cuts, and a preface especially written by the author, will be added.

### TRANSFORMATION AND ADAPTATION IN SCIENTIFIC THOUGHT.

PROF. ERNST MACH. In Nos. 46 and 48.

Ernst Mach, Professor of Mechanics at the University of Prague, author of several works explanatory of the history and philosophy of mechanics, and the first authority in his branch, discusses in this essay an idea that conditions the development of modern scientific thought. The article was delivered as an address by Prof. Mach upon assuming the rectorate of the University of Prague.

### ORIGIN OF REASON.

LUDWIG NOIRÉ. In No. 33.

An essay of great importance; will greatly help to explain the views of Max Müller. The same number contains an editorial upon Monism and Philosophy, in which is discussed the Identity of Language and Thought, the theories of Noire and Müller, and the proof with which modern philology has corroborated the monistic conception.

### THE HIBBERT LECTURES AND THE GAULISH PANTHEON.

BY S. ARTHUR STRONG. In No. 63.

An instructive essay upon the purposes of the Hibbert Foundation, with a review of the recent lectures by Prof. John Rhys upon the religion of the ancient Celts. The original investigations of Prof. Rhys have thrown a new and welcome light upon the forms of belief in ancient Gaul, Wales, and Ireland, and they are regarded as a monumental work in the province of philological archaeology.

### CHRISTIANITY AND RELIGION.

BY DR. GUSTAV CARUS. In No. 70.

Dr. Gustav Carus, Superintendent General of the State Church of Eastern Prussia and one of the most prominent clergymen of Germany, criticizes the work of THE OPEN COURT. The principles of the monistic and melioristic philosophy are discussed in their relation to Science and Christianity. The criticism is pervaded by an earnest, thoughtful, and religious spirit.

In the same number, under the title "The Religious Character of Monism," appears an editorial

reply to the above criticism. The position of THE OPEN COURT is defended, its tenets justified, and its principles more fully explained.

### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.

FELIX L. OSWALD, M. D. In Nos. 27, 29, 31, 33, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53 and 57.

The Science of the thousand-fold *moral effects of physical causes* is still a sealed book to a large plurality of our fellow-men. The ethics we have inherited is biased by the tenets of an anti-physical and anti-natural philosophy, and the tendency of the latter has even been to sanction and exaggerate the *physical effects of moral causes*. Dr. Oswald says: "Our entire system of moral education needs a thorough revision, and the success of urgent social and ethical reforms depends on the radical reconstruction of moral philosophy on a basis of natural science." The subject is treated in the graphic manner which has ever characterized Dr. Oswald's contributions to the Literature of Natural History and Anthropology. It is marked by the usual wealth of illustration and abounds in felicitous and pertinent citations of historical and natural evidence.

### THE UNIVERSAL FAITH.

BY T. B. WAKEMAN. In No. 71.

### THE FOUNDER OF THE NINETEENTH CENTURY CLUB.

BY MONTEGUE D. CONWAY. In No. 71.

Two important and interesting articles upon the life, work, and influence of the late Mr. Courtland Palmer, of New York, the liberal and high-minded founder of The Nineteenth Century Club.

# THE OPEN COURT.

## WHAT MIND IS.

PROF. E. D. COPE.....In No. 40.

## THE NATURE OF MIND.

By THE EDITOR OF THE OPEN COURT. No. 40.

Professor Cope gives in clear and comprehensive outlines his view of mind; he opposes Materialism and Dualism, stating that "the situation is monistic." However, "as the amount of thought can most assuredly be measured, but the quality of thought can not," the eminent American scientist concludes that "consciousness has a field of its own where it ranges free from the bonds of energy." The directive element (will and mind) is qualitative not quantitative and controls the movements of the non-mental environment. "This statement may be called occultism," Prof. Cope adds, "and I suppose justly. But such is the fact."

In opposition to Prof. Cope, the Editor explains his view of mind. The qualitative faculties are a matter of form. Form is the essential characteristic of mind, and a superior mind indicates a superior form of brain structure. Form is an abstraction from reality and has by itself no efficacy. M. Ribot, the founder of the French school of experimental psychology, is quoted in support of the fact that consciousness by itself is not an effective factor in the motion of our limbs. "The consciousness of mental states may be indispensable for a proper direction of our will, but it does not possess motive power. Prof. Cope's view is considered inconsistent because leading to dualistic statements and to occultism."

A letter from Prof. E. D. Cope, which has reference to this discussion, is published in No. 42.

## FREE-WILL A MECHANICAL POSSIBILITY.

XENOS CLARK.....In No. 39.

Mr. Xenos Clark here presents in an interesting and attractive manner certain scientific analogies bearing upon Free-Will and Determinism. A novel and ingenious application is here made of the theory of linkages and link-work which of late has so interested mathematicians and been developed with such striking success by Prof. Sylvester. The article will be found to be unusually suggestive, although it is not in concord with THE OPEN COURT, which, in an editorial of No. 33, admits the truth of both *Free-Will* and *Determinism*.

## THE FUNDAMENTAL PROPERTIES OF MATTER.

J. G. VOGT.....In Nos. 29, 31, and 34.

To the *kinetic* conception of the world's mechanism Vogt opposes his hypothesis of a *continuous* world-substance completely filling space and whose sole manifestation of power consists in *contraction* or *condensation*. He claims that the kinetic or mechanical theory, which explains organized and spiritual phenomena from inelastic atoms and a purposeless force, is untenable; and that pseudo-morphism, which transforms the most complex conditions and processes of physical life into the elementary substance itself, involves the fallacy of idealism and dualism. As opposed to both views Vogt propounds his conception, which he calls *Monism of Reality*. He attributes to matter two fundamental properties, motion and sensibility, and deduces from these elementary properties the higher phenomena of intellectual life.

## ETHICS AND PUBLIC LIFE.

W. M. SALTER.....In No. 43.

The well-known lecturer of the Society for Ethical Culture in Chicago bravely probes the wounds of our public life and shows his patriotism by boldly denouncing the evils and wrongs of American politics. But he is no pessimist; he does not despair of improvement and progress. He knows very well that men "of Roman virtue" still exist. Mr. Salter wants to elevate our conception of politics, so that the best men in the community would lose their repugnance to public life; that they would enter it once more to make it great and illustrious.

## THE PROBLEM OF CAUSALITY.

In No. 35 is an editorial discussion of The Problem of Causality. The surpassing importance of this subject renders a clear conception of it absolutely indispensable to correct observation and sound reasoning. Despite this the problem has been unbecomingly neglected, and this neglect has given rise to innumerable errors and to an astounding lack of lucidity in scientific discussion. The problem is treated with clearness and precision; simplicity of presentation being especially aimed at.

The comments and discussions elicited by the article on "Causality" will be found to be especially instructive and elucidative. In Nos. 38, 39, and 60, Mr. William M. Salter advances a series of critical remarks, which are replied to in the same numbers by the articles, "Causes and Natural Laws" (No. 50), "Is There Anything Unknowable in Causation" (No. 59), "Is Nature Alive," and "The Stone's Fall" (No. 60). In No. 58, Mr. M. A. Griffen writes a letter upon the same subject; in No. 60, Dr. Edward Brooks, of Philadelphia comments upon the standpoint taken: all of which are accompanied by editorial comments.

## REMINISCENCES OF MR. ALCOTT'S CONVERSATIONS.

MRS. EDNAH D. CHENEY.....In Nos. 49 and 50.

In Nos. 49 and 50 THE OPEN COURT publishes a paper upon Mr. Alcott's conversations, read by Mrs. Ednah D. Cheney, before the Memorial Meeting of the Concord School of Philosophy. Mrs. Cheney's recollections of Mr. Alcott lead us back as far as the year 1840. The reminiscences cover almost a half a century of Mr. Alcott's intellectual life. Abstracts are given of his conversations, incidents described in which noted contemporaries figured, and anecdotes told illustrative of Mr. Alcott's life and thought.

Wheelbarrow, in No. 52, contributes an additional reminiscence of this "amiable philosopher and venerable man."

## DETERMINISM VERSUS INDETERMINISM.

PROF. GEORG VON GIZYCKI.....In Nos. 25 and 26.

Georg von Gitzky is Professor of Philosophy at the University of Berlin. His name is well known beyond the boundary of his country. The problem of the Freedom of the Will has perhaps never been treated in a clearer and more forcible manner. Contributions on the same subject have been published from L. F. Powell and Xenos Clark.

## THE BASIS OF ETHICS.

### THE SOUL.

### FREE TRADE AND PROTECTION.

By EDWARD C. HEGGLER.....In Nos. 1, 15, and 62.

## THE FIELD-INGERSOLL CONTROVERSY

An editorial discussion of the Field-Ingersoll Controversy and of Mr. Gladstone's Remarks upon the same, will be found in Nos. 43 and 44. The questions and issues involved are treated from an independent and impartial standpoint. The inefficiency of Agnosticism to approach a solution of the religious problem is shown; Agnosticism being but a negative view of the world. The true position and significance of both parties in the development of the religious ideas are pointed out and each is recognized as important and necessary to the ultimate synthesis of religious truth, a religion which will in clude what is good in all.

## ECONOMIC CONFERENCES.

WHEELBARROW.....In Nos. 37, 40, and 47.

The Economic Conferences of Chicago may be hailed as a significant indication of a breach in the barrier between Labor and Capital. The conferences have served as a medium for the open exchange of opinion, where both sides are fairly represented. Wheelbarrow's criticisms are acute and pithy; and merit a careful perusal. The author unites Old Saxon simplicity, sincerity of heart, the truthfulness of honesty and warm sympathy for justice and right.

## THE ANIMAL SOUL AND THE HUMAN SOUL.

CARUS STERNE.....In Nos. 37, 41, and 43.

An essay full of fine thought and psychological depth. Carus Sterne well understands to follow a subject as historically developed in the realm of human opinion and as ultimately affected by the light of Modern Science. The question of the relation of the animal to the human soul has ever been of interest and in this essay we find it attractively yet accurately treated.

## THE SPIRITUALIST'S CONFESSION.

By MONCURE D. CONWAY.....In No. 63.

An interesting article upon the recent confession of the Fox Sisters at the Academy of Music, N. Y., with a short historical sketch of the Spiritualist movement in America and England.

## PLANTATION FOLK-LORE.

L. J. VANCE.....In Nos. 41, 45, and 46.

Mr. Vance reviews and discusses the movement and widespread interest in popular tales which has produced the recent collections of Negro Myths by Joel Chandler Harris ("Uncle Remus") and Mr. Charles C. Jones. These tales form an important addition to the Folk-Lore of the New World, and Mr. Vance's review will be welcomed by all who wish to acquire a comprehensive estimate of the significance of these Myths to comparative literature and the science of comparative ethnology.

## PUBLICATIONS OF "THE OPEN COURT."

Three Introductory Lectures

—03—

## The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

By F. MAX MÜLLER.

1. The Simplicity of Language;
  2. The Identity of Language and Thought; and
  3. The Simplicity of Thought.
- With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.
- Neatly Bound in Cloth. Price, 75 Cts.

## The Marriage Problem.

By E. D. COPE, Ph.D.

PRICE, 15 CENTS.

A scientific discussion, from a practical standpoint, of the question now engrossing the public attention.

## THE IDEA OF GOD.

By PAUL CARUS, Ph.D.

PRICE, 15 CENTS.

Being a disquisition upon the development of the Idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Entheism, the Monistic Conception of God.

## THE ANIMAL SOUL AND THE HUMAN SOUL.

BY CARUS STERNE.

Part III.

Translated for THE OPEN COURT by *sq.*

A comparative analysis of the structure of the organ of thought teaches us with even more certainty than does the analysis of the internal processes, that, in the line of vertebrate development which culminates in man, the changes leading from the lowest cerebral forms to the highest structure of the human brain are very gradual,—so gradual, indeed, that no leap in development is perceptible. Even in the lowest vertebrate forms, the structure of the brain is essentially the same as in man; the anterior portion of the spinal cord is divided into five parts, lying one behind the other, termed, according to their locations, the fore-brain, the intermediate brain, the mid-brain, the cerebellum, and the medulla oblongata.

Of these divisions the posterior ones, which control the lower and indispensable functions of the animal body, are first developed, while the anterior portion, which we with good reason believe to be the organ of consciousness, remains, for the time being, so small that the other parts greatly exceed it in size; while in the higher classes of vertebrates it is much the largest of all the parts, and is called the cerebrum or brain proper.

There is a similar relation between those organs of the brain which control the senses. In the human being we regard smell and taste, when compared to sight and hearing, as inferior senses; but in the brain of the lowest vertebrates the olfactory lobes, which are in direct communication with the nostrils, are conspicuous by their size, whilst in the higher animals they are quite insignificant. In the lower animals this sense is apparently the most important; one might say, they scent their way through life. But we know that with the human being the most delicious odors suggest nothing more than the source from which they have originated; they excite the palate only and not the mechanism of the intellect.

In birds and reptiles, also, the relative development of the mid-brain and of the cerebellum is greatly advanced beyond that of the fore-brain, and it is only in mammals that the predominance of the fore-brain, the sphere of the intellect, over the organs of simple

sense, becomes noticeable. But even in this instance differences are perceptible among the various divisions. In the lowest mammals, *e. g.*, water-moles, opossums and edentates (sloths), a very essential part of the brain of higher animals is scarcely indicated, viz., the *corpus callosum*, a callous mass which unites the two hemispheres of the cerebrum.

In this connection, it is most instructive to compare the intelligence of these animals with the imperfect construction of their brains, and upon this point a report of Dr. F. L. Oswald who has given especial attention to the care of sloths, is of great interest. He says:

"Though fed daily by the same hands, the sloth still fails to identify his benefactor or to recognize his obligations in any way. To his ear the human voice in its most endearing tones is a grunt *et præterea nihil*: you might as well appeal to the affections of a cockroach. You may frighten a pig, a goose, a frog, and even a fly, but you cannot frighten or surprise a sloth. On my last trip to Vera Cruz I procured a pair of black tardos, full-grown and in a normal state of health, so far as I could judge, but after a series of careful experiments I have to conclude that their instinct of self-preservation cannot be acted upon through the medium of their optic or acoustic nerves. They can distinguish their favorite food at a distance of ten or twelve yards, and the female is not deaf, for she answers the call of her mate from an adjoining room; but the approach of a ferocious-looking dog leaves her as calm as the sudden descent of a meat-axe within an inch of her nose. The he-sloth witnessed the accidental conflagration of his couch with the coolness of a veteran fireman. War-whoops do not affect his composure. I tried him with French-horn-blasts and detonating powder, but he would not budge. One of my visitors exploded some pyrotechnic mixtures of wondrous colors and infernal odors, but the tardo declined to marvel; he is a *nil admirari* philosopher of an ultra-Horatian school."

Not alone in the vertebrates does the brain plainly show an ever-increasing development to higher forms, and an unmistakable increase in mass; we find also in the individuals of a single species a similar change, proving an increase of intelligence, with time, in the same

\* F. L. Oswald, *Zoological Sketches*, Lippincott & Co., 1883, p. 69.

genus. Thus most of the reptiles of the Secondary Age possessed a much smaller brain than do their direct descendants of like size at the present day. In the case of fossils and living animals of the same family a similar increase is proved by impressions taken of the brain-pan, which the brain completely fills; the increase in direct descendants is thus seen to be marked.

The investigations instituted within the last decade by O. C. Marsh, Filhol, and other palæontologists, concerning the skulls of tertiary mammals, have proved beyond a doubt that the organ of psychical activity, the size of which can be minutely determined from skulls now extant, has developed with startling rapidity and oftentimes increased in volume to a much greater degree than the body, with whose increase in size the brain generally keeps comparative pace. O. C. Marsh has been able to offer a striking instance of this in the equine species, which are well known on account of their appearance in great numbers during the entire tertiary age; the horse of the present age being connected by almost imperceptible degrees with its five-toed ancestor of the Eocene period, which was related to the tapir tribe, to-day so totally different. Now, while in the horse the brain has developed comparatively much faster than the body, yet in the tapir which is so little altered in its osseous structure that it bears a greater resemblance to the ancient equine than does any other equine of the present day, the brain has remained small, and is quite in accordance with the limited intelligence of these animals. An Indian tapir which has been closely observed in one of the zoological gardens, has indeed accustomed itself to the society of man in so far that it will follow him like a dog, will stop when he stops, is troubled if its companion should hide behind a tree-trunk, gives vent to its delight by sidling up to him when he reappears, but yet is unable to distinguish its friend from any stranger, and will go through the same performance with any one who will take the trouble to try it. Its intelligence seems to correspond with its pre-historic brain in dimensions; it has recognized that man in general is worthy of emulation and that he is inclined to be a friendly playmate, but it is incapable of distinguishing one of these two-legged beings from another.

While the tapir is a fair representative of the average intelligence of mammals of the Eocene period, the brains of its near relatives have in the intervening ages doubled, tripled, yes, even tenfold increased in size, and, what is perhaps most remarkable in the matter is, that their extraordinary development is not uniform in all parts of the brain but is confined principally to the two hemispheres of the cerebrum, which all modern psychologists believe to be the seat

of intelligence. The striking similarity of the structure of the brain in the higher mammals (and particularly in monkeys) to that of man, the homology of the different parts of the brain proven by experiment, indicate that man has inherited not only his other parts and organs from the animal, but also his organ of intelligence, and that therefore his intelligence does not differ from that of the animal in kind, but only in degree. Were there any further doubt about it, it would be dispelled by observing the development of the brain in the human infant, which begins with the same primitive forms as those of the lowest vertebrates, then increases, and shortly before birth bears a remarkably close resemblance to the brain of the anthropoid. Preyer has demonstrated, in his excellent work upon "The Soul of the Infant," how limited the intelligence of the human being is, even after birth; and how little it exceeds that of an intelligent animal when lacking a systematic education, is proven by savages in their lowest stages.

If we wish to be honest then, we must admit that man has brought with him from his former animal existence the foundation of his present mental superiority. The brain of man does not, in either form or size so greatly exceed that of his nearest relative in the animal world, as does the brain of the mammal of the present age exceed that of its early tertiary ancestors. The animal period has thus afforded the instrument for a development beyond the point attained by the animal, and it is probable that at the present time it works according to the same fundamental laws as it did formerly, and that however much the present progress may be in advance of the average former development, these advantages have been gained only by bringing into the light of consciousness internal processes which had before been at work in the dark, and thus making them accessible to observation and refinement. These processes and the art of language, which so greatly fashioned the realm of thought, necessitated, we may assume, the enlargement of the two frontal hemispheres of the human brain; but it was a question of the development of an already existing structure, planned with regard to the minutest details, and not of a new structure.

We cannot, therefore, recognize any essential difference between human and animal thought, even in the above mentioned probable difference; the line of division is very uncertain, and they who deny that the animal possesses consciousness err quite as much as they who attribute to it an intellectual capacity equal to their own. When we observe how animals, devoid of all consciousness, are able to assert themselves in the struggle of existence quite as well as those that act with the greatest deliberation, the question forces itself upon us whether consciousness in its first obscure

phases is not a mere attendant phenomenon of life, and whether it is not a self-deception to regard the *ego*, that latest product of development, as having a separate and independent existence, and to believe that it controls the organ upon which it after all proves itself to be dependent. It must engender a mistrust in us to find this proud subject constrained to admire its own doings, simply because it cannot trace their origin or even comprehend it. It is a melancholy truth that our best ideas are brought to light in very much the same way, as a fisher, throwing out his line at random, suddenly draws forth a speckled trout. This very fact alone, that our intellect is unable to comprehend its own action and processes, ought to warn us to seek its origin, not in higher and loftier spheres, but in low and limited circumstances.

All those who have ever closely observed themselves while thinking will acknowledge the justice of the proposition made by the witty Lichtenberg, when he suggests that, instead of saying "I think," we had better say "it thinks,"\* just as we say "it lightens" or "it storms." The new idea generally comes so suddenly that, with all our consciousness, we do not know where it has come from. The cause of this startling fact is that it was physically conceived in the physical organ, and first came to light (i. e. to consciousness) only after its completion. We know from experiences in dream-life that the organ continues its operations without conscious stimulus, and when not under vigilant control, it will even form the boldest combinations. There are then "unconscious ideas" just as there are "slumbering recollections;" consciousness of the operations of the brain is not an indispensable necessity, it is not their constant companion, and there are many persons whose actions are altogether the result not of clear and conscious deliberation but of vague impulses. They act in accordance with their entire character or, we might say, with their brain-constitution, without asking themselves why they act so, and without the thought ever occurring to them that they might act otherwise.

With regard to dreams we are more willing to admit the passive part we play in the operations of the brain. We also unwillingly acknowledge our impotency to clearly remember or define what is but a vague recollection; thus we say: "it seems to me," "it appears to me," or when a name has escaped our memory we say: "it is on the tip of my tongue." In short, the *ego* is not a sovereign ruler in its palace, it cannot think how and what it will, and even in poets and in professional thinkers it must "list to the higher inspiration" and await "the hour of ecstasy"; it is a rider borne by an obstinate steed, and obliged to let

the latter carry him whither it will, unable to command it.

A very good proof of the fact that we do not think but "are thought" is found in dreams from which we are awakened by a sudden noise. A generally very clever rider, whose steed, however, carries him unnecessarily far into labyrinthian mysteries has recently made use of these dreams to prove thereby the depth of the human soul-life. Because in certain conditions of excitability we think and dream faster than usual, because the noise which awakens us from slumber rapidly arouses in us a phantasy which the sound itself seems to complete, Du Prel concludes that there is also a transcendental, super-human kind of thought in man which is not dependent upon the material nerve apparatus, and therefore does not require the length of time that a nerve-act generally does. It is far more probable, however, that there is not so much time required for illogical dream combinations, for vague recollections, etc., as for logical thought and systematic efforts of memory, and that we deceive ourselves in imagining that we are suddenly awakened from a dream which we must complete before awakening. We probably never awaken from a deep dream to full consciousness suddenly; on the contrary, we calmly continue and complete our dream before fully awakening. Yes, we sometimes unconsciously finish the dream, and the apparent suddenness then lies only in the fact that we become suddenly conscious of the dream which has lain buried in the memory, just as we may suddenly recall our entire past life; for it is not a case of forming new ideas, but one of reviving existing recollections.

However, it is not our intention to assert here that the operations of the human intellect are an altogether comprehensible phenomenon; it is at present in the first stages of self-comprehension, and it will do well not to attempt to explain that which is itself difficult to understand, by something still more difficult. The worst chase of all is the chase of the will-o'-the-wisp.\*

#### THE ANÆSTHETIC REVELATION.

BY XENOS CLARK.

Dr. Felix Oswald's account, in No. 38, of the drugs which artificially stimulate various emotions, does not include sulphuric ether, probably from want of space. Within a few years it has been discovered that this anæsthetic often produces a most singular effect on the mind of the patient or experimenter who has taken it, giving rise to what has been called the "anæsthetic revelation." Just as the experimenter recovers from the anæsthetic, and before wide-awake consciousness fully returns, he has an intense perception of what seems to him at the time the philosophic secret of

\* Compare editorial "It Thinks" in No. 22 of THE OPEN COURT.

existence—the true explanation of the universe. This singular impression, though intense, does not last long, and in spite of the subject's strongest effort to carry the "revelation" out into wide-awake consciousness, he finds himself unable to do so, but is left full of awe by his strange experience, and wonder at the nearness of the solution which for so many ages has been sought so far afield. The present brief account has been gathered from the literature of the subject, which grows yearly. Mr. Benj. Paul Blood, of Amsterdam, N. Y., the discoverer of the phenomenon, originally made it known to psychologists in a pamphlet entitled *The Anæsthetic Revelation*, and he has since discussed its philosophical bearings in the *Journal of Speculative Philosophy*, January, 1886. The most scientific account appears in the *Therapeutic Gazette* for August, 1886, where Dr. Geo. E. Shoemaker of Philadelphia relates his "Recollections After Ether-Inhalation." MIND discusses it in Vol. IV, p. 345, and Vol. VII, p. 206. Dr. Oliver Wendell Holmes mentions the experiment in his "Mechanism of Mind and Morals" (p. 46); a letter from the poet Tennyson concerning his own experience has recently reached the press; and valuable newspaper accounts of the phenomenon may be found in the *New York Tribune*, September 3, 1886, the *New York Evening Post*, October 30, 1886, and the *Utica Herald*, September 15, 1886.

The abstract, philosophic nature of the ether dream gives it a special interest to students of philosophy and psychology. By its intensely specific character it differs entirely from the opium or hashish hallucination. The opium-eater may dream of a thousand different things; but the ether patient invariably has one fixed impression, a belief that the ultimate secret and explanation of existence stands revealed to him as finite knowledge never has and never could reveal it. The singular thing is that this impression may happen to a man who has never given one thought to philosophy, and whose mind therefore is devoid of material for this impression. This fact, and the specific likeness of effect of the ether on all who have made the experiment, has led some psychologists to declare the impossibility of considering the phenomenon a dream, and to claim place for it as genuine philosophic insight. Further and more accurate experimenting will throw clearer light on what is one of the most singular discoveries known to modern psychology.

#### PARABLES.

Translated from the Arabian by HENRY BYRON.  
II.

#### THE BREAD OFFERING.

In my childhood I was one day playing in the kitchen when mother entered.

The new cook, who was busy baking bread, was

just going to throw a large piece of dough, the burnt offering, into the fire,\* when mother said:

"Bake bread also of this part of the dough; we will give it to the poor. It is thus that the bread-offering has always been offered up in my house. Listen, my daughter, to what I tell thee: Give thy bread to the poor and thy heart to God!"

#### III.

#### THE CONSPIRACY.

My grandmother, who lived to be over ninety years of age, retained a degree of bodily and mental vigor which was truly marvelous at such an age. But as time, however gracious and lenient it might be, will—like a mighty sovereign upon his vassals—impose upon us some tribute, and were it only as a sign of our dependence and submission, the poor old lady, too, had to pay a tax to this all-powerful Sovereign. It consisted in the weakness growing on her in her high old age of allowing her usual love of cleanliness to become exaggerated and morbid. She began showing an aversion to any food, for the preparation of which the hands had to be directly used, unless she prepared it herself. Thus she objected to eating any bread not kneaded by her own hands, and resolved to make the bread for our household herself. In vain did mother try to dissuade her from it; in vain my eldest sister offered to do the work under her direction, at the same time, partly in joke, partly in earnest, holding up her extremely delicate white little hands for examination; the old lady persisted in her resolution.

Then we all entered into a great conspiracy against grandmother. She was allowed to knead the dough, which she invariably did in the evening shortly before going to bed; but as soon as she had retired we children gave a signal to mother or eldest sister, and the actual kneading then began—for, poor grandmother, how could, we have told her! Poor grandmother had not the strength to knead all the dough in the capacious trough for our numerous family.

That is the only conspiracy I ever took part in and I pray to God that if ever I participate in another it should not have a less good object, nor leave behind it less agreeable recollections.

#### AGNOSTICISM AND RELIGION.

##### A DISCUSSION OF THE FIELD-INGERSOLL CONTROVERSY.

In Dr. Johannes Ranke's most excellent work on anthropology† man and mankind are compared to a wave. A wave appears to the eye as a material unit. Its form travels along on the surface of the water, ever one and the same; but its substance is constantly changing. It is the mere expression of a number of rhythmical motions, and there are not two consecutive

\*A practice common with many Oriental nations. (The Translator.)

† Dr. Johannes Ranke; *Der Mensch*, p. 1.

moments in which the constituent particles are the same. The drops which one moment are seized by the approaching wave, rise in the next to its crest and then glide gently back on the other side of the billow to the quiet surface of the ocean.

The body of the wave is formed by the atoms of water which enter into and pass through the wave. Similarly the human body, like a wave of water, is a certain form of rhythmical motions. Material elements, the air we breathe, the food we take, are seized upon, only to pass through and leave the body, whose form continues and appears to the unknowing as the same material unit.

The same simile is true of mankind as a whole. The activity of the human race, as we observe it in history, rolls onward like a huge wave over the surface of the habitable globe. It incorporates and transforms the organic materials in its way only to give them back to the ocean of organic substance from which they were taken. In the onward course of human evolution, the generations of which it consists rise into existence and sink back as the wave of humanity rolls on. The generation of to-day is different from the generations of former centuries, but humanity is one continuous whole throughout all of them. It began with the origin of life on our planet and its onward movement will continue as long as the organic substance of the earth will afford sufficient material to renew its form.

The changeability of form constitutes what we call evolution. Evolution indeed means 'change of form according to certain laws.' Laws of form are geometrically demonstrable and laws of the changes of form can be ultimately accounted for with mathematical precision.

From this point of view the intellectual development of the human race, is the sum total of certain ideas which are transmitted from one generation to another. These ideas, the rhythmical undulations of a spiritual wave, travel along over the ocean of the human mind and seize upon the coming generations whose intellectual life they form. But as the form of a billow changes in its course, as it increases and reaches its climax in the foam and tumult of the breaking surge, so too have ideas their history; they develop and grow and pass away; they heave and swell in a ceaseless struggle until they sink back into the depths from which they have risen.

From this point of view, the swelling and sinking, the rising and falling, the current and the undertow, do not appear as two different things which perchance have met, and being of a different nature counteract one another; from this point of view they appear as a unity—as two stages of one and the same undulation or motion and as two complementary con-

stituents of one and the same wave. Single human individuals are not separate independent beings. Their likes and dislikes, their characters and personalities can be accounted for in and through the transmission of ideas. From this point of view adversaries appear as counterparts which do not exist but for one another and through one another. An idea may pass through the most different and antagonistic phases, even through its own negation, and yet remain one and the same idea. It is created by the same cause and will take its course through all differentiations in the regular evolution of all its forms.

Hegel formulated one law of the intellectual development of ideas as *thesis*, *antithesis*, and *synthesis*.

The solution of a problem is attempted by some philosophers in one way, while others try the very opposite method; then a third party comes and proposes to combine both. The Eleatic school conceived abstract existence as unchangeable, eternal, and immutable. They proved that even an arrow in its flight was at rest. Heraclitus on the contrary taught the eternal restlessness and mutability of existence in his famous axiom: *πάντα ῥεῖ*, "all is in motion." Plato succeeded in combining these contradictions in his Doctrine of Ideas, which in the perpetual flow of life represent the unchangeable forms of existence.

The truth that adversaries are but two aspects of one and the same movement has been realized by political leaders. A political movement wants opposition for the sake of its own existence. Those issues are dead which meet with heedless indifference and a great politician advised his partisans if they did not find opposition to create opposition.

A dim recognition of this truth has induced those who wage the battles of intellectual life to do honor to each other. They instinctively feel that they honor themselves in honoring their adversaries. And this is easily explained since their adversaries are real parts of themselves. The ideas in the brains of opponents have been produced by the same cause; they attempt to solve the same problem and they merely represent opposed aspects. The one must contend with the other, until both are merged into a new form. The directive principles of both, notwithstanding their irreconcilable enmity, are preserved; the contradictory elements disappear and from the fusion of two one-sided truths a new and greater truth is born.

From this objective standpoint of scientific observation the articles of the Rev. Henry M. Field and the Hon. W. E. Gladstone on the one side, and Col. R. G. Ingersoll on the other, do not appear as opinions of which the one must be true and the other must be false; they appear as the expressions of one and the same idea in two aspects. It is the *thesis* and the *antithesis*, the positive statement and its negation. The

one has been written to antagonize and contradict the other; but truly it would not exist without the other; it exists because of the other. And as the wave of the religious idea passes onward over the great ocean of human development, both will merge into one and give rise to a new form of the same old religious idea which will represent its *synthesis*, combining in a higher union the truth of both statements.

The contest is not a personal duel between Mr. Gladstone and Col. Ingersoll, it is an ideal conflict and behind the champions stand millions who are represented by the one or the other. We have learned from the published articles that the two parties are as different as can be; one party means to annihilate the other, and looks upon it as the exponent of unspeakable absurdity and arrogance.

It has always been the rule for the believer to call the unbeliever names, and the latter has never hesitated to repay him with ridicule. Col. Ingersoll has been regarded as a flippant blasphemer and a superficial scoffer while 'Ingersollians' freely speak of clergymen as hypocrites and impostors. The champions on both sides of this recent controversy happily refrain from direct personal insults. But we are told from the one side that Mr. Field is glad to know his adversary, "even though some of his brethren look upon him as a monster because of his unbelief." And from the other side we are informed that the believer is superstitious; he is addicted to convictions which are designated as the infamy of infamies and devoted to a most unnatural and cruel deity. A serious attempt is made by both parties to treat one another with due respect and consideration, but neither can the believer suppress his contempt for reckless unbelief—unbelief reckless in offending the feelings of others, nor can the unbeliever disguise his hatred of the existing creeds; certainly he does not hate the Presbyterians, but he hates Presbyterianism.

In spite of this hatred and contempt, in spite of all difference, both parties are much more like one another than they are themselves aware of. Both belong to one another, and as soon as the one shall pass away the other party must go also, not to disappear entirely but only to reappear, the one reconciled to the other, the one being transformed and purified through the other, in a nobler and grander *synthesis*.

The first step in solving the great religious problems must consist in an amicable exchange of opinion; and this amicable exchange must rest on the confidence that both parties are honest in their convictions and that both have something to say. Clergymen are but too prone to denounce the unbeliever from the pulpit; the infidel rejects belief, they say, because he wants to free himself from moral authority in order to live the licentious life of a libertine. And on the

other hand free-thinkers are too much inclined to picture the clergy as a hypocritical set of men who live upon the folly and ignorance of their fellow beings. Both parties are in this respect narrow and wrong, for the orthodox believers should know that the heretic as a rule has pure motives for his dissent, and the free-thinker could easily be informed that there are clergymen who devote all their time, and their labor, and their interest to the afflicted and sorrow-laden, who are true pastors of their congregation and faithful physicians of the soul, attending on those who are in need of their care.

The clergyman who unjustly suspects the infidel of bad motives does not promote true religion, he panders to prejudice and injures religion; and the free-thinker who reviles religious people as fools or hypocrites does not enhance truth and free thought, he prevents the progress of radical free-thought by setting an example of judging others from a prepossessioned opinion.

But an honest and amicable exchange of opinion, it must be well understood does not mean peace; it means fight, an honest fight for the sake of truth. And by our explanatory remarks on the principles at stake we do not wish to stop the fight but to call attention to its importance and prepare the minds of bystanders to judge impartially and to sympathize with the champions on both sides.

Ingersoll and his adversaries are wonderfully alike. They are alike in the style and pathos of their diction, in their method of reasoning and in the zeal for their cause. But substantially also they agree on the most essential points; they teach the same ethics, and they declare that they have no positive knowledge about God or a future life and cannot have any.

Mr. Field became personally acquainted with Col. Ingersoll and found out that two souls must reside within his breast. He says:

"I could not reconcile the two, till I reflected that in Robert Ingersoll (as in the most of us) there are two men, who were not only distinct, but contrary the one to the other—the one gentle and sweet-tempered; the other delighting in war as his native element. Between the two, I have a decided preference for the former. I have no dispute with the quiet and peaceable gentleman, whose kindly spirit makes sunshine in his home; but it is that other man over yonder, who comes forward into the arena like a gladiator, defiant and belligerent, that rouses my antagonism."

If Col. Ingersoll became acquainted in a similar way with an earnest Christian, he also would find two souls in his breast, and indeed Col. Ingersoll states that Christ himself is such a man. And, strange to say, the belligerent Ingersoll also gives preference to the gentle Jesus. "To that great and serene peasant of Palestine" he "gladly pays the tribute of his admiration and his tears." And at the same time, Col. Ingersoll severely censures the belligerent reformer who

has said: "I come not to bring peace but a sword."

This similarity of the predilection of the gentle soul in other people's bosoms prevents both Mr. Field and Col. Ingersoll from appreciating the militant and warlike character of their opponents. If Mr. Ingersoll were attached to any religious creed, he also (like the gentle Jesus) would have turned the money-changers and those who bought and sold, out of the temple, the house of prayer; and if Mr. Field were an unbeliever like Col. Ingersoll, would not he also denounce the belief of the orthodox as monstrously immoral and their deity as a personification of vices? We believe they would.

Neither the champions on the one side, nor those on the other trouble much about arguments. They are satisfied with assertions, and each one easily tears the counter-assertions of his enemy to pieces by giving some imperceptible turn to the words of his adversary and deriving therefrom the most absurd consequences. Col. Ingersoll for instance says, "that Christ offered a reward not only in this world but in another to any (!) husband who would desert his wife," and Mr. Field infers that according to Col. Ingersoll "he who sacrifices his life for a faith, or an idea is a fool," and that "family life" must wither under his "cold sneer."\* There are innumerable insinuations of a similar kind on both sides and indeed both parties make for this special purpose an enemy of straw and belabor him soundly. What Col. Ingersoll says against Christianity will please many prepossessed free-thinkers but it will induce no believing Christian to abandon his faith, for Christianity is not such as Col. Ingersoll depicts it in his articles. And Mr. Field may be comforted for the sake of civilization and society—"the destructive creed or no creed" does not take away "the support of morality." Mr. Ingersoll's unbelief is more moral than the belief of many a good Christian.

Mr. Gladstone is very indignant about the flippancy, the lack of calmness and sobriety which are essential in the discussion of important questions. But he forgets that Col. Ingersoll pays in the same coin as scientists have been accustomed to be paid by theologians. Col. Ingersoll is one of the first free-thinkers to use the most effective weapons of the clergy against their churches and creeds. Col. Ingersoll's diction is not that of a logician or a patient teacher, it is that of a preacher. The flow of his words and the brilliancy of his style are more impressive than his arguments. How beautiful are passages such as the following:

\* "Solemnity need not be carried to the verge of mental paralysis. In the search for truth—that everything in nature seems

to hide—man needs the assistance of all his faculties. All the senses should be awake. Humor should carry a torch, Wit should give its sudden light, Candor should hold the scales, Reason, the final arbiter, should put his royal stamp on every fact, and Memory, with a miser's care, should keep and guard the mental gold. \* \* \*

"I beg of you not to pollute the soul of childhood, not to frown the cheeks of mothers, by preaching a creed that should be shrieked in a mad-house. Do not make the cradle as terrible as the coffin. French, I pray you, the gospel of intellectual Hospitality—the liberty of thought and speech. Take from loving hearts the awful fear. Have mercy on your fellow men. Do not drive to madness the mothers whose tears are falling on the pallid faces of those who died in unbelief. Pity the erring, wayward, suffering, weeping world. Do not proclaim as 'tidings of great joy' that an Infinite Spider is weaving webs to catch the souls of men. \* \* \*

"The idea of immortality, that, like a sea, has ebbed and flowed in the human heart, with its countless waves of hope and fear beating against the shores and rocks of time and fate, was not born of any book, nor of any creed, nor of any religion. It was born of human affection, and it will continue to ebb and flow beneath the mists and clouds of doubts and darkness as long as love kisses the lips of death.

"I have said a thousand times, and I say again, that we do not know, we cannot say, whether death is a wall or a door—the beginning, or end, of a day,—the spreading of pinions to soar, or the folding forever of wings—the rise or the set of a sun, or an endless life, that brings rapture and love to every one."

Is the diction of these passages that of argument or the rapture of a seer who is full of his subject and carries his hearers along with the stream of music and poetry in his utterance?

When Gretchen asked Faust whether he believed in God, he answers her with these beautiful words:

Who can name him, and, knowing what he says,  
Say, "I believe him?" And who can feel,  
And, with self-violence, to conscious wrong  
Hardening his heart, say, "I believe Him not!"  
The All-embracing, All-sustaining One,  
Say, doth He not embrace, sustain, include  
Thee?—Me?—Himself?—Bends not the sky above?  
And earth on which we are, is it not firm?  
And over us with constant kindly smile,  
The sleepless stars keep everlasting watch!  
Am I not here gazing into thine eyes?  
And does not All, that is,  
Seen and Unseen, mysterious All—  
Around thee and within,  
Untiring agency,  
Press on thy heart and mind?  
Fill thy whole heart with it—and when thou art  
Lost in this blissful consciousness—  
Then call it what thou wilt,  
Happiness!—heart!—love!—God!  
I have no name for it—Feeling is all;  
Name, sound and smoke  
Dimming the glow of heaven!

Gretchen hears only the music of his words and answers:

This is all good and right;  
The priest says pretty much the same,  
But in words somewhat different.

The case is quite similar with Mr. Ingersoll. He sets forth the cause of unbelief after the methods of a zealous and enthusiastic preacher. Instead of advancing arguments he intoxicates with poetry, and theologians should be the last to blame him for that. The most prominent theologians have been flippant so far as scientific facts were concerned which they could not reconcile to their views. We do not say this to censure them, but to state a fact; and we do not speak of inconsiderable men, but of the most prominent in history, men who command the respect of both parties, the free-thinkers and the orthodox. One citation may serve for many. Luther said about Copernicus, the famous canon of Frauenburg:

"Mention was made of a contemporary *astrologus* who claimed to prove that the earth moved and turned about, but not the Heavens, nor the Firmament, nor Sun, nor Moon; just as when a person is seated in a wagon or on a boat and is in motion, and fancies he is sitting still and at rest while the earth and trees do seem to pass along and be in motion. But the whole matter is just this: whensoever a person means to be smart, he must perforce make up something of his own, which has to be the best that is, just as he makes it. This fool will upset the whole Science *Astronomicæ*. But the Holy Scriptures tell us, Joshua bade the *Sun* stand still and not the *Earth*."<sup>\*</sup>

We have never doubted Luther's greatness, but all the strength of his character which enabled him to become the great Reformer of the Church does not acquit him of having shared the one great theological fault of sometimes being flippant with great truths. Copernicus had devoted a whole life-time to the study of astronomy, but Luther "disposed in half an hour"† of any astronomical problem.

If Col. Ingersoll is too hasty in forming his opinion on certain subjects, if he forms his opinion in accordance with pet prejudices, he certainly shares this fault with his enemies, and has, perhaps, unconsciously adopted this method of keen sarcasm and active aggressiveness from his theological adversaries.

Preachers have the habit of appealing to their hearers' sympathies rather than to their reason. They picture pitiful sights and touch the hearts of their listeners. We read on p. 493:

"Only the other day I saw a beautiful girl—a Paralytic, and yet her brave and cheerful spirit shone over the wreck and ruin of her body like morning on the desert. What would I think of myself,—"

Dr. Field would continue:—

"What would I think of myself, should I take away the comfort of religion from her who, being incurably ill, has to resign all earthly hope?"

But Col. Ingersoll continues:—

"What would I think of myself, had I the power by a word to send the blood through all her withered limbs freighted again with life, should I refuse?"

The sad picture does not prove anything, neither in favor of Mr. Field, nor in favor of Col. Ingersoll.

We read in Mr. Field's letter on page 138 the following passage:

"Take another case—alas! too sadly frequent. A man of pleasure betrays a young, innocent, trusting woman by the promise of his love, and then casts her off, leaving her to sink down, down, through every degree of misery and shame, till she is lost in the depths which plummet never sounded, and disappears. Is he not to suffer for this poor creature's ruin? Can he rid himself from it by fleeing beyond 'the bourne from whence no traveler returns?' Not unless he can flee from himself: for in the lowest depths of the under-world—a world in which the sun never shines—that image will still pursue him. As he wanders in its gloomy shades, a pale form glides by him like an affrighted ghost. The face is the same, beautiful even in its sorrow, but with a look upon it as of one who has already suffered an eternity of woe. In an instant all the past comes back again. He sees the young unblest mother wandering in some lonely place, that only the heavens may witness her agony and her despair. There he sees her holding up in her arms the babe that had no right to be born, and calling upon God to judge her betrayer. How far in the future must he travel to forget that look? Is there any escape except by plunging into the gulf of annihilation?"

Such a story about the seduction of a beautiful girl—pale, "beautiful even in her sorrow"—never fails to carry away popular audiences. The argument in it is zero, but it excites our compassion, so it is serviceable for the purpose. Certainly it is serviceable for the contrary also, and Col. Ingersoll does not hesitate to use the same subject and addresses his opponent with these words:

"You have taught that this poor girl may be tormented forever by a God of infinite compassion. This is not all that you have taught. You have said to the seducer, to the betrayer, to the one who would not listen to her bewailing cry—who would not even stretch forth his hand to catch her fluttering garments—you have said to him: Believe in the Lord Jesus Christ, and you shall be happy forever; you shall live in the realm of infinite delight, from which you can, without a shadow falling upon your face, observe the poor girl, your victim, writhing in the agonies of hell."

One of the great Athenian orators noticing that the jurors did not pay any attention to his logical argument, suddenly changed the subject and told them a story about the shadow of a donkey. The sleepers awoke and listened. Pulpit orators know what effect stories have. And the moral drawn is easily made to fit the circumstances.

The zeal with which the preacher propounds his tenets easily leads him to bold affirmations that seem to afford a plausible basis for his views. This rashness makes him prone to take truths for granted which in other spheres will overturn his own arguments. An orator does not expect any one of his audience to rise and point out his inconsistencies and this security makes him careless. If the great preacher of free-thought, Col. Ingersoll, in his fervid enthusiasm commits similar mistakes, his opponents kindly offer to take the mote out of his eye and forget that they

\* Translated from Luther's *Tischreden*; Ed. Walch, p. 2560.

† Mr. Gladstone's remark, p. 499, upon Col. Ingersoll's methods.

carry beams in their own. We cannot here extract the beam from the eye of dualistic religion, but we feel compelled to show by a few instances what is meant by the mote in Col. Ingersoll's eyes, for motes are not so easily detected as beams.

Col. Ingersoll says: "We think in spite of ourselves" and "no one can justly be held responsible for his thoughts," (p. 476), for "belief is a result" and "the will cannot knowingly change evidence" (p. 633.) But is not action a result also? And could a man of a certain character with a certain amount of knowledge and in a certain condition act otherwise than he does. Certainly he cannot and yet he must be held as much responsible for his actions as Col. Ingersoll is for the articles he has written. A man can act otherwise than he does, if we influence his character or add to his knowledge or change the conditions in some way, but then again his action will be a result, and he will be responsible for it, if it was his free choice, which means if the result has emanated from his character.

A man is responsible for his thought, for the thought of a man is the character of the man; it is the man himself.

If a man *is* not responsible for his opinion, he is not at all responsible. "The scales turn in spite of him who watches." But the scales of our opinion contain our own likes and dislikes. Our opinion is formed under their influence and is the exponent of our character. Col. Ingersoll says in just contradiction to himself: "What would the opinion of a man without passions, affections or fancies be worth?"

For the purpose of undermining the moral value of honest error, Col. Ingersoll declares that: "Acts are good, or bad, according to their consequences, and not according to the intentions of the actor." It would by no means be strange if occasionally he should maintain the contrary. Not the man who unintentionally shoots his brother is a murderer, but he who nourishes the hateful crime in his bosom, who takes his aim but misses. The failure of a criminal plot does not make the evil-doer good, and cannot justify his act.

Whether the English judges in the Popish plot gave judgment in accordance with their opinions and whether Napoleon expressed his real opinion when he justified himself for the assassination of the Duc d'Enghien, are historical questions which if definitely decided may be used as instances of the moral responsibility or irresponsibility of our actions. Mr. Ingersoll declares: "If you (Mr. Gladstone) answer these questions in the affirmative, you admit that I am right. If you answer in the negative, you admit that you are wrong." Is not this dilemma much like the game: "heads I win, tails you lose!" And is not

this sweeping way of arguing much like the dialectics of ecclesiastical preachers from the early fathers down to modern days. Thus, we are told by Augustine that only the Christian has virtues, for the pagans are either downright vicious or, if they have virtues like the noble Greeks and Romans of antiquity, their virtues are tarnished vices. This way of reasoning which leaves only the dilemma "either I am right or you are wrong," has been acquired by pulpit orators who are sure that their auditors heartily concur in every word they say. And is it not natural that an anti-clerical orator should adopt the methods of his adversaries?

How often have free-thinkers been depicted in the pulpit as people who can never enjoy a happy and blissful moment in their lives. Only a true Christian heart, Luther thought, can be right merry and joyful, and only a faithful believer can die in peace. Now we are told that "the Church has always despised the man of humor." But how does this agree with the fact that the jolliest men we have ever met have been Roman Catholic clergymen? It is true that the gloomy Puritan type is prevalent among the clergy of this country, but it is well known that in continental Europe the happiest and merriest family life is that of an idyllic village parsonage. The same is true of the observance of Sunday. The orthodox Sabbath is gloomy only in England, in the English colonies and in America. The Christians of Continental Europe, Catholics and Protestants, and the early Christians too, have always looked upon the Jewish Sabbath as an institution which had been overruled by Christ's word: "That the Son of man is Lord also of the Sabbath."\* And even pious but liberal Jews of to-day look upon the strict observance of the Sabbath as a custom, the enforcement of which has been beneficial in a remoter time but is now no longer necessary.

Both Dr. Field and Col. Ingersoll do not look at religious problems from the impartial standpoint of the scientist. Their discussion is not the co-operation of two truthseekers who approach one common goal from different sides. It is rather a fight, and Col. Ingersoll confesses it in his letter to Mr. Field:

"You say that I ought to soften my colors, and that my words would be more weighty if not so strong. Do you desire that I should add weight to my words? Do you really wish me to succeed? If the commander of one army should send word to the general of the other that his men were firing too high, do you think the general would be mislead? Can you conceive of his changing his orders by reason of the message?"

Both parties fight and they both fight for the truth. For the sake of truth it is not advisable for either to "soften his colors." And the truth is that not

\* See Luke 6, 3-5. The context plainly proves that the expression "Son of man" is not limited to the person of Christ.

only in their methods of fighting but also in the substance of their beliefs they agree more than appears at first sight. They fully agree that of the subject about which they fight, no one either has or can have any definite knowledge. Agnosticism is the common ground upon which both parties stand. Col. Ingersoll confesses his ignorance on the subject and Mr. Gladstone praises his wisdom for doing so. The difference between the two parties is merely that the one believes because we have (as they think) no positive knowledge of the subject, and the other party for the very same reason rejects all belief. Col. Ingersoll confesses the possibility of God's existence. He says:

"I do not say that a God does not exist, neither do I say that a God does exist; but I say that I do not know—that there can be no evidence to my mind of the existence of such a being."

And in a similar manner he does not deny the belief in immortality:

"The belief in immortality is far older than Christianity."

"The hope of immortality is the great oak round which have climbed the poisonous vines of superstition. The vines have not supported the oak—the oak has supported the vines. As long as men live and love and die, this hope will blossom in the human heart."

If things were as Col. Ingersoll declares, if "the world is a mystery," and "every thing in nature is equally mysterious," if "nothing can be mysterious enough to become an explanation" (p. 486), if "the mind is so that man cannot grasp the idea of an infinite personality," and if science "has taught man that he cannot walk beyond the horizon"—most people will consider it advisable to believe in the God of tradition and in immortality with its dangerous correlative idea of eternal damnation, and they will bow down in decent modesty before a problem which we are too weak to solve. If the agnostic side were the ultimatum of science on religious questions, then certainly there would be no use in discussing the subject. But the fact is we *can* know something about religion and religious truths; we *can* find out what is true and what is false.

(To be concluded.)

#### IDOLS.

BY \* \* \* \*

The charming fairy-tales, which gently soothe  
Our childhood's easy griefs, must melt away;  
And sad Reality will soon dismay  
The bright phantasmal idols of our youth.

But from them our Ideals spring! Forsooth  
The childish frolic doth the man display.  
As fruit grows, whilst the blossom must decay,  
Thus from romantic errors springs the truth.

\* Mr. Field expresses himself similarly. He says: "Science can only go a certain way, beyond which we come into the sphere of the unknown, where all is dark as before."

But when the creed of Christianity  
Breaks down, it merely is the husk, which shows  
The evil fate of transient vanity.

Out of the bursting germ the fruit-tree grows,  
And Idols of religion will disclose  
The high Ideal of Humanity.

#### A FABLE.

BY THE DEACON.

A FISH who was of the unfortunate sort,  
And always complaining—a habit unwise,  
Once saw a companion dart after a prize,  
Sent down by some innocent lover of sport.

"He's got it! and so like my luck! I declare,  
He shot right a-past me! Such things are not  
fair!"

Sobbed the fish who had missed it—with other  
remarks

Quite common to fish-folk, from minnows to  
sharks;

But learning, in time, of that cruel hook, baited:  
"Ah, how providential," he cried, "that I  
waited!"

—From "*Jack-in-the-Pulpit*," in ST. NICHOLAS for  
June.

## CORRESPONDENCE.

### THE ORIGIN OF LIFE AND THE PROBLEM OF MEMORY.

TO THE OPEN COURT:

I have read the Rev. H. H. Higgins's essay on "The Individuality of Atoms and Molecules" with great interest, for I aspire to the same goal, which is a monistic explanation of life. The Rev. Mr. Higgins says: "Evolutionists have to choose between discontinuity and the recognition of a universal principle of life, which may be regarded not as mechanical, but as inherent in the primordial atom." It is the same idea which underlies the theory of J. F. Vogt, as propounded in *THE OPEN COURT* (Nos. 29, 31 and 34). He scorns the views which would resort to an origin of first life-cells, and declares that matter must have the two fundamental principles—"motion and sensibility." But while the Rev. Mr. Higgins attributes an individual *bias* (or life-unit) to every atom, J. F. Vogt believes in a continuous, contractile, elastic world-substance; and the atoms of modern chemistry (the existence of which Vogt accepts as a scientific fact) are according to this theory centers of concentration.

Mr. Higgins, as well as Vogt, opposes the view of kinetic materialism which teaches that the atoms are hard, inelastic, ultimate units, and that these atoms, themselves lifeless, produce all the wondrous phenomena of life by their mechanical interaction. I agree with both in so far as I also look upon kinetic materialism as an untenable explanation of the world, and in so far as I take for granted that life must be an inherent quality of the world-substance and its atoms. But I disagree with Vogt and with Mr. Higgins also, as regards their atomic theories. Both their views are speculations, mere conjectures as to what the atom may be; and neither of them can prove by experiment or argument that his view is correct. Both go into their subject dogmatically, and both are confident of having attained a

correct solution of the problem—a confidence which perhaps is justified and easily explained from their conviction of the truth of their monistic principle, for the demonstration of which they have taken the trouble of devising their theories.

With the monistic principle from which both start, I agree. I consider this principle as the basis of modern science, and would fain see it established as an axiom of philosophy. In propounding an atomic theory of my own, I am fully conscious of the fact that although certain arguments are in its favor, it is a speculation which, at present, our scientists can not prove or verify by experiment. If my view is wrong, it will perhaps be easy to refute it.

I imagine that matter in its fundamental properties is homogeneous. The world-substance very probably is continuous, as Vogt declares, and may be identical with what our physicists call ether. The tenuity of ether is such that we cannot with our most delicate instruments verify its presence, and can only infer its existence from such physical phenomena as light and electricity. Whether it consists of discrete units we cannot know; it is possible that it does. But if it indeed consist of minute units, single and uniform, (I should call them with Leibnitz *monads*), it is certain that the world-substance possesses at the same time a continuity which places all these monads in relation to one another.

By continuity of the world-substance I understand a quality which binds all the ultimate units together so that the innumerable monads are not single independent individuals, but integral parts of the whole world—parts which by their positions mutually influence one another according to laws which can be ascertained and mathematically accounted for.

Two or more ether-monads combine into what is known as atoms, two or several atoms into molecules. The ether-monads are uniform, the atoms of the same combination of monads are uniform, and also the molecules of the same combination of atoms are uniform.

The combination of ether-monads into elementary atoms is comparable to the process of crystallization of substances. Certain it is that it must take place according to a mathematical law. The atom must have a crystal-like shape; it must form a geometrical figure consisting of two or more monads.

This explanation of the problem seems to me the only possible solution which agrees with Mendeleeff's law of the periodicity of atomic weights. If the atoms possessed, as Mr. Higgins says, individuality and idiosyncrasy, it would be very strange if not miraculous that one atom of oxygen is exactly like unto every other atom of oxygen. What can be the cause of this, as far as we can judge, absolute identity of all atoms of the same element? Can it really be an individuality and idiosyncrasy from all eternity? If it were, I should be disposed to believe *a priori* (if I did not know anything to the contrary) that no two atoms would be exactly like each other, and that innumerable elements could be found in nature. Facts disprove this.

The absolute identity of two atoms of the same element can be reasonably explained only if we consider their identity as a sameness of form. Suppose, e. g., that two uniform monads of the homogeneous ether, by a certain pressure, at a certain degree of heat, and under other certain yet unknown conditions, crystallized, as it were, into a certain geometrical figure which chemists now call an atom of Hydrogen. Under other conditions thirty-two monads will combine into another geometrical figure, which would be an atom of Oxygen. The substance in the two monads of the Hydrogen atom and the thirty-two ether-monads of the Oxygen atom is supposed to be the same ether; but the combinations are different. If we knew what the geometrical shapes of the atoms were, we would be able to state why in the one case two and in the other thirty-two monads are required to make up one atom.

If the difference of the various elements is a difference of form

only, we can account for their uniformity in all regions of the universe as easily as we account for the spheroid shapes of the heavenly bodies and for their paths in conic sections. Moreover, if such is the case, we understand why the number of the elements is so limited, and why the atomic weights of the elements are so regular and invariable. Perhaps if we had a sufficiently powerful lens we could arithmetically compute and geometrically demonstrate why the atomic weight of iron, for example, is exactly 56, why at the same time an element of one or a few unit-weights more or less cannot exist, and why the periodicity of the atomic weights cannot be otherwise. Perhaps such a *demonstratio ad oculos* of the fundamental chemical law would be as simple as to show that the tetrahedron has four, the octahedron eight, the tetrabexahedron twenty-four equal faces of equilateral triangles, that the cube's faces are squares and those of the dodecahedron, pentagons. We, then, shall see why elements of the atomic weights, 7, 23, 39, etc., exist, and why atoms of intermediate weights are as impossible as, e. g., a heptahedron with congruent faces is a geometrical impossibility.

If the combinations of the monads into atoms are limited to the comparatively small number of about seventy elements, it is natural that the possibilities for molecular combinations increase immeasurably; and the possible combinations of molecules into specific substances must be infinite.

Mr. Higgins's expression "idiosyncrasy" cannot well be applied to the individuality of the ultimate units of matter, as the word denotes "a peculiar mixture of something." If anything is not mixed, it is the elements; and the ultimate units of matter cannot be said to possess an idiosyncrasy. But this is perhaps a mere verbal difference.

The main point, however, is this: the world-substance possesses life as an intrinsic property. The world-substance is not acted upon by pressure, but it acts spontaneously and of itself. This, I should say, is the fundamental thought of Vogt's essay, this is also the main idea of Mr. Higgins's explanation. Our scientists have attempted in vain to explain the origin of life from dead matter. The truth is that life never originated. Life is as eternal as the world and to search for a beginning of life is as wrong as to search for the origin of matter.

It is of little consequence whether we define life in this broader sense of the word as spontaneity or as intrinsic energy or as self-motion (cf. THE OPEN COURT p 971) but we must well distinguish this kind of life (which is the inherent quality of matter) from the psychic life of organisms. The former is elementary and eternal, the latter is unstable because provided by a combination of the former. The life of monads must be considered as uniform and most simple, that of organisms as manifold and highly complex. But if there is an essential difference between both is is not that of spontaneity, or self-motion, which is generally considered as the characteristic of life; the essential difference is the absence of psychic life in the one and its presence in the other.

The basis of psychic life is memory. In the monads, the atoms, and the molecules of organic matter we have not as yet been able to discover memory, but protoplasm, the moners, and the cells of organized matter have memory. Accordingly, the problem of the origin of life is not how to account for spontaneous motion of living bodies, but how to account for the memory of organized matter. All matter possesses spontaneity of motion; but the faculty of remembering is limited to protoplasm.

It is a very strange fact that protoplasm, being a very complex compound exhibits in its first stage a singular sameness wherever it is found. This indicates that here also the solution of the problem must be looked for in the structure of the protoplasm. The shaping of forms follows mathematical modes; and unalterable regularity is always dependent upon the laws of form. Mathematics, I am fully convinced, will explain the nature of the

elements; but mathematics must do more for science, it must also explain the problem of the origin of memory. The question, how matter can remember will become the fundamental and ultimate question of psycho-physiology. c.

## BOOK REVIEWS.

IN NESTING TIME. *Olive Thane Miller*. Boston: 1888. Houghton, Mifflin & Co.

The general character of this author's writings is well understood, and "In Nesting Time" does its part to help establish her well-earned fame. Mrs. Miller is an intelligent and loving observer of nature, has familiar acquaintance with all the feathered songsters of the fields and knows their habits better than it is possible for the human animal ever to know the peculiar traits of its kind. Most of the essays in the present volume have been printed before in the *Atlantic Monthly* and other periodicals, but they deserve their present permanent setting. The publisher's work is done with the usual care and neatness. A pretty design ornaments the cover, and an appropriate selection from some poet introduces each of the fifteen chapters. C. P. W.

THE GAMBLER. *Franc B. Wilkie*. Chicago: 1888. T. S. Dennison, Publisher.

The above is further characterized as "A Story of Chicago Life," and describes the downward career of a young man, born and bred in the country, who, accidentally becoming heir to a large fortune, takes up his home in the city where he falls into evil ways, squanders his fortune, goes headlong to ruin and shame and dies an outcast in the hospital. The story is told with a painful and at times unpleasant realism, and while written for a manifestly good purpose, and to point a moral, its workmanship is so careless, which a style often degenerating into slang makes worse, that the force and dignity of the work is greatly weakened for the more intelligent reader. "The Gambler" belongs to the sensational order of novels so far as its subject-matter is concerned, but a different style of treatment, such as one of the author's reputation must be equal to, would have set it far above that class. Mr. Wilkie doubtless thought to add pungency and truth to his narrative by preserving in his own style much of the vernacular and rhetorical dash of the characters with whom he deals; but this robs the book of all charm of ideality, which may be preserved even in the description of scenes and incidents of the kind with which "The Gambler" deals. But the book has this merit that it nowhere glosses over the social sins which it depicts, nor, according to Tennyson's lately-written line condemning the practices of some of the realists, "paints the mortal shame of nature with the living hues of art." C. P. W.

A PURE-SOULED LIAR. Chicago: 1888. *Chas. H. Kerr*.

A Pure-Souled Liar is, for originality of plot, finished and entertaining style, and high purpose, one of the most notable books of fiction recently issued from the press. Added to this is the wonderful air of reality that pervades the book, especially in the opening chapter. This is due, we think, in part to very cunning art, and also to the circumstance of the author's complete incognito. The story reads in the beginning like a chapter from real life, and though the reader's interest is not held in such startled attention in the succeeding portion of the work yet it seldom flags. Directness of style and sincerity of purpose characterize every page. The *personnel* of the story are chosen from that enticing, perplexing class, marked by aspiring souls and Bohemian instincts—the students of a modern Art Institute; thus supplying an agreeable variety to the motive and characters of the average society novel, of which we are getting rather too many. We could wish, however, that the unknown author had spared us the bit of

moralizing at the end where she draws the unnecessary and unjust deduction which traces the dark and melancholy experience of the principal characters to the influence of the Art Institute. Institutions of that kind doubtless have a certain order of temptations for those who profit by their advantages, but they should not be held too rigidly to account for results in youthful error and misconduct likely to follow youthful folly and inexperience everywhere. We do not like the title of this book, which has an affected sound; neither do we like the circumstance which led to its selection. Much as we admire "A Pure-Souled Liar" for its literary grace and excellence and for the manifest nobility of the author's intention, we find neither reason nor justice in the main *motif*. The lesson which it inculcates is one of a morbid and wasteful notion of self-sacrifice, supported by a rash and weak sense of duty.

C. P. W.

EUGENE BODICHON: ŒUVRES DIVERSES. *Ernest Leroux, Editeur*. Paris: 1886.

About thirty years ago a bridal couple came to America on a visit who attracted much attention in social and artistic circles. Mad. Bodichon was the daughter of a well known liberal member of Parliament, who was herself an accomplished artist in water colors. Her beauty, talent and charming manners at once secured her a welcome in society, and she is still remembered with warm affection. Dr. Bodichon was less generally known, and few of us perhaps were aware of his large claims to our respect and admiration. We are therefore pleased to call attention to this book, which reveals to us something of his beneficent life and high character and aims.

He was born at Mann's (Loire Inférieure) in the year 1810, and died in Algeria in 1885.

A great part of his life was passed in Algeria, where he became a great public benefactor. He practiced his profession there gratuitously, teaching the principles of hygiene and sanitary science both by his practice and his writings. He took an active part in the development of the colony, where he was honored by the name of "l'honnête Bodichon." He was one of the first to point out the importance of the Eucalyptus tree in preventing fever, and devoted much time to its introduction into the colony, and it was due to him that Algeria was included in the decree abolishing slavery.

When the *coup d'état* occurred his name was foremost on the list of those proscribed by the new tyranny, but the general tore up the list with an oath, crying: "Must I exile from Algeria all the most honest men."

The latter part of his life was divided between his home in Algeria and his wife's residence in Sussex. A French writer says:

"When Algeria shall write its golden book the name of Dr. Bodichon will shine on the first page, and his book will remain an indispensable document for him who shall undertake to write the history of the political and social theories of France in the 19th century."

To those who did not know Dr. Bodichon personally this book is still of great interest and value as revealing the deepest thought of a liberal Frenchman of the most advanced school, who writes from no motive but the desire of honestly expressing his thoughts. He is also a man of wide experience and active life, whose observations must be accepted as of value, whether we can accept his conclusions or not.

He himself says:

"He who has formed a conscientious opinion owes an account of it to the public. To be silent is cowardice. Little matter if the author makes a sacrifice of time, labor and money. Let him be approved or blamed, read or disdained, before all he must say what he thinks."

His religious axioms are full of interest; for while he demands

and uses the broadest liberty, he is full of respect for the highest and best in religions. He says noble things of Christianity. "Christianity has raised humanity," but he does not fear to condemn the superstitions that have gathered about it. "Devotees are one of the bad elements of humanity. It is they who are always the impudent fabricators of miracles, frauds, slanders, of pious calumnies."

He distinguishes between religion and the various religions. He says: "The religions have become in the hands of the priests the romance of our relations between God and the unknown world."

"The best prayer, the prayer useful by itself, is labor, is study."

He predicts for Anglo-America that it will become the New Jerusalem \* \* of the seekers if it allows itself to be governed by the puritans and quakers. "Let it read the Bible," he says. "All biblicists are friends of liberty."

These extracts show as many others would, how broadly and tolerantly he looks on all sides while the emphasis he lays on reading the Bible and other points betray his Catholic surroundings whose evil he clearly sees. We must pass over many interesting topics to note the largeness of thought and freedom from prejudice of country, shown in Dr. Bodichon's estimate of the future of Great Britain. He claims that she will be a refuge "for the proscribed of the universe and one of the first people of the world." "For many centuries yet she will march at the head of European civilization." His judgment of his own country is less hopeful, he prophesies that England will rule over her, because she is "the region of positivism, of application, of religious sentiment." But he says "North America is really the queen of the Universe—all the progress of perfected humanity will be made practical there. More than a thousand millions of men will live there, all equal, free, rational, religious workers, serving for an example to the rest of men."

Passing over many a page full of thought and instructions on the great questions agitating society, we must close with speaking of his terrible arraignment of Napoleon Bonaparte. Broad and liberal as he was, he yet lived through the *coup d'état* and the empire of Louis Napoleon, and his feeling against the older and greater representative of that family was doubtless embittered by that circumstance. Nowhere have we ever seen condemnation more fierce and sweeping. He tries him by a sort of subjective analysis, declaring that "history has not painted him as he was." His own summary is that he was "the eldest son of the children of the demons, that is to say the most intense, the most powerful incarnation of the principle of evil which the human form has ever clothed."

We can only say that it seems to us impossible that such a monster could have won the reverence, admiration and personal affection of a people, as Napoleon with all his faults did. The effects are not accounted for by the cause. It is, however, wise to study the portrait painted by this brave and true-hearted even if prejudiced observer.

It is always a gain to know another brave and true soul, and we feel refreshed and invigorated by coming into relation with this upright and intelligent Frenchman who helps us to look at the world of life and thought with his eyes. E. D. CHENEY.

#### NOTES.

The death of the Emperor Frederick III, apart from the sorrow and sympathy awakened for the mourning subjects of a sister nation, will be lamented by all who have at heart the interests of liberal thought and politics in continental Europe. The sterling qualities which marked the hero of Sadowa and Wörth, the singleness of heart and beneficent disposition which so endeared him to the affections of his people, foretold for Germany a reign of

national self-respect and of peaceful, liberal development. We have all followed him in the sad affliction which has at last blasted these promises. We believe that the rumors of William II.'s warlike disposition and selfish ambition will prove unfounded, and hope that the exemplary career and sad fate of his father will influence and determine his policy.

In Frederick III. the Free-masonry of the empire have lost a staunch friend and influential patron. Masonic institutions in Germany differ from the Masonry of our own country, in so far as they embody a more progressive spirit and represent a sturdy, reverent free-thought. Their ideas, their aims and their principles of action have been deepened by the philosophy of men like Goethe, Schiller, and Lessing, and we may therefore well understand the far-reaching influence which the sanction and sympathy of royal patronage have exercised through its foremost exponent of humane liberalism.

We have recently received at our office copies of M. Francois Coppée's appeal in verse to the late Emperor. It is a noble tribute to his character and political intentions, prefacing a request for the restitution of Alsace and Lorraine as the only warranty of international peace and as the fitting crown of a career so glorious. Accompanying the same we received a copy of Ernest Lemcke's response in French verse to the appeal of M. Coppée, written from the German standpoint. Both poems may be obtained from B. Westermann & Co., of 838 Broadway, New York.

George Kennan's Siberian paper in the *July Century* will be called "The Steppes of the Irish," and it will include an account of a long ride in an out-of-the-way part of Siberia, among the Kirghis and the Tartars.

Mr. Louis Prang, the head of the famous Art Publishing Firm of Boston, has contributed to *The American Lithographer and Printer* a concise and excellently written article on *Our Tariff*. He says that his business, according to the principle of protection would derive great benefit from a Tariff. But the fact is it has been built up independent of, and even in spite of protection. He says:

"When I find my business will not hold its own under natural conditions, I shall give it up. \* \* \*

"Protection has no doubt fostered a few old established industries and created a number of new ones, but at what a terrible cost to the nation! It has to a great degree emasculated our industrial life, it has taken out of it the spirit, the freedom, the character. \* \* \* It has un-Americanized us by making narrow, selfish views dominant, where the fathers of this Republic proudly declared that a broad humanity should be the leading principle of American civilization. \* \* \*

"Tariff taxation has degraded us from the position of self-reliant freemen to the abject condition of industrial cowards, crying and begging like babes for more protection against the very nations we are so fond of decrying as beneath us in the social scale. \* \* \*

The *Atlantic Monthly* for July discusses in the "Contributor's Club" "The Science of Names."

"Writers it is maintained spend much time and thought in selecting a name for a play or novel, for they know that success is largely dependent on it. Parents, however, are strangely careless and unscientific in giving names to children. \* \* \*

"Avoid odd, or eccentric, or poetic combinations, and be guided by euphonic quality only. \* \* \*

"The best form of name is a dactyl and a spondee, like 'Jeremy Taylor.'"

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

## CHAPTER XVII.—Continued.

Mr. Hummel looked meditatively on the spot where the Doctor had stood.

He was during the whole day in a mild, philanthropic mood, which he at first showed by philosophizing with his book-keeper.

"Have you ever raised bees?" he asked him, over the counter.

"No, Mr. Hummel," replied he; "how could I manage it?"

"You are not very enterprising," continued Hummel, reproachfully. "Why should you not give yourself this pleasure?"

"I live in a garret, Mr. Hummel."

"That does not matter. By the new inventions you may keep bees in a tobacco-box. You put the swarm in, open the window, and from time to time cut your honey out. You might become a rich man by it. You will say that these insects might sting your fellow-lodgers and neighbors; do not mind that; such views are old-fashioned. Follow the example of certain other people, who place their bee-hives close to the street in order to save the expense for sugar."

The book-keeper seemed to wish to comply with this proposition.

"If you mean——" he replied humbly.

"The devil I mean, sir," interrupted Hummel; "do not think of coming to my office with a swarm of bees in your pocket. I am determined under no circumstances to suffer such a nuisance. I am Bumble-bee† enough for this street and I object to all humming and swarming about my house and garden."

In the afternoon, when he was taking a walk in the garden with his wife and daughter, he suddenly stopped.

"What was it that flew through the air?"

"It was a beetle," said his wife.

"It was a bee," said Hummel. "Are this rabble beginning to fly about. If there is anything I detest, it is bees. Why there is another. They annoy you, Phillipine."

"I cannot say so," she replied.

A few minutes after, a bee flew about Laura's curls, and she was obliged to protect herself with a parasol from the little worker, who mistook her cheeks for a peach.

"It is strange; they were not so numerous formerly," said Hummel, to the ladies; "it seems to me that a swarm of bees must have established itself in a hollow tree of the park. The park-keeper sleeps out

there on a bench. You are on good terms with the man; call his attention to it. The vermin are insufferable."

Madam Hummel consented to make inquiries, and the park-keeper promised to look to it. After a time he came to the hedge, and called out, in a low voice:

"Madam Hummel."

"The man calls you," said Hummel.

"They come from the garden of Mr. Hahn," reported the park-keeper, cautiously; "there is a bee-hive there."

"Really?" asked Hummel. "Is it possible that Hahn should have chosen this amusement?"

Laura looked at her father anxiously.

"I am a peaceful man, keeper, and I cannot believe my neighbor would do us such an injury."

"It is certain, Mr. Hummel," said the park-keeper; "see, there is one of the yellow things now."

"That's so," cried Hummel, shaking his head; "it's yellow."

"Don't mind, Henry; perhaps it will not be so bad," said his wife, soothingly.

"Not so bad?" asked Hummel, angrily. "Shall I have to see the bees buzzing around your nose? Shall I have to suffer my wife to go about the whole summer with her nose swollen up as large as an apple? Prepare a room for the surgeon immediately: he will never be out of our house during the next month."

Laura approached her father.

"I can see you wish to begin a quarrel anew with our neighbors: if you love me, do not do so. I cannot tell you, father, how much this quarreling annoys me. Indeed I have suffered too much from it."

"I believe you," replied Hummel, cheerfully. "But it is because I love you that I must in good time put an end to this annoyance from over there, before these winged nuisances carry away honey from our garden. I don't intend to have you attacked by the bees of any of our neighbors, do you understand me?"

Laura turned and looked gloomily in the water, on which the fallen catkins of the birch were swimming slowly towards the town.

"Do something, keeper, to preserve peace between neighbors," continued Hummel. "Take my compliments to Mr. Hahn, with the request from me that he will remove his bees, so that I may not be obliged to call in the police again."

"I will tell him, Mr. Hummel, that the bees are disagreeable to the neighborhood; for it is true the gardens are small."

"They are so narrow that one could sell them in a bandbox at a Christmas fair," assented Hummel. "Do it out of pity to the bees themselves. Our three daffodils will not last them long as food, and after-

\* Translation Copyrighted.

† Hummel is also the German for bumblebee.

wards there will be nothing for them but to gnaw the iron railings."

He gave the park-keeper a few coppers, and added, to his wife and daughter:

"You see how forbearing I am to our neighbor, for the sake of peace."

The ladies returned to the house, depressed and full of sad forebodings.

As the park-keeper did not appear again, Mr. Hummel watched for him on the following day.

"Well, how is it?" he asked.

"Mr. Hahn thinks that the hives are far enough from the street; they are behind a bush and they annoy no one. He will not give up his rights."

"There it is!" broke out Hummel. "You are my witness that I have done all in the power of man to avoid a quarrel. The fellow has forgotten that there is a Section 167. I am sorry, keeper; but the police must be the last resort."

Mr. Hummel conferred confidentially with a policeman. Mr. Hahn became excited and angry when he was ordered to appear in court, but Hummel had in some measure the best of it, for the police advised Mr. Hahn to avoid annoyance to the neighbours and passers-by by the removal of the hive. Mr. Hahn had taken great pleasure in his bees; their hive had been fitted with all the new improvements, and they were not like our irritable German bees; they were an Italian sort, which only sting when provoked to the utmost. But this was all of no avail, for even the Doctor and his mother herself begged that the hives might be removed; so, one dark night they were carried away, with bitter and depressed feelings, into the country. In the place which they had occupied he erected some starlings' nests on poles. They were a poor comfort. The starlings had, according to old customs, sent messengers of their race through the country and hired their summer dwellings, and only the sparrows took exulting possession of the abode, and like disorderly householders, left long blades of grass hanging from their nests. Mr. Hummel shrugged his shoulders contemptuously, and in a loud bass voice, called the new invention the sparrow telegraph.

The garden amusements had begun; the sad prognostication had become a reality; suspicion and gloomy looks once more divided the neighboring houses.

#### CHAPTER XVIII.

##### CLOUDLETS.

A Professor's wife has much to bear with her husband. When Ilse found herself seated with her friends, the wives of Professors Raschke, Struvelius, and Günther, over a cozy cup of coffee, which was by no means slighted, all manner of things came to light.

Conversation with these cultured ladies was in-

deed delightful. It first touched lightly on the subject of servants, and the troubles of housekeeping called forth a volubility of chatter, like the croaking of frogs in a pond, and Ilse wondered that even Flamina Struvelius should express herself so earnestly on the subject of pickling gherkins, and that she should anxiously inquire as to the marks of age on a plucked goose. Merry Mrs. Günther shocked the ladies of greater experience and at the same time made them laugh, when she told them she could not bear the cry of little children, and that as to her own—of which she had none yet—she would from the beginning train them to quiet habits with the rod. As has been said, the conversation rambled from greater matters to small talk like this. And amidst other trivial remarks it naturally happened that men were quietly discussed, and it was evident that, although the remarks were made as to men in general, each thought of her own husband, and each, without expressing it, thought of the secret load of cares she had to bear, and each one convinced her hearers that her own individual husband was also difficult to manage. The lot of Mrs. Raschke was indeed not to be concealed, as it was notorious throughout the whole town. It was well known that one market-day her husband went to the lecture-room in a brilliant orange and blue dressing-gown, of a Turkish pattern. And the collegians, who loved him dearly and knew his habits well, could not suppress a loud laugh, while Raschke hung his dressing-gown quietly over the reading-desk and began to lecture in his shirt sleeves, and returned home in the great-coat of a student. Since then Mrs. Raschke never let him go out without looking after him herself. It also transpired that after living ten years in the town he constantly lost his way, and she did not dare to change her residence, being convinced that if she did, the Professor would always be going back to his old abode. Struvelius also gave trouble. The last affair of importance had come to Ilse's personal knowledge; but it was also known that he required his wife to correct the proof-sheets of his Latin writings, as she had a slight knowledge of the language—and that he could not resist giving orders to traveling wine merchants. Mrs. Struvelius, after her marriage, found her cellar full of large and small casks of wine, which had as yet not been bottled, while he himself complained bitterly that he could not replenish his stock. And even little Mrs. Günther related that her husband could not give up working at night; and that on one occasion, poking about with a lamp amongst the books, he came too close to a curtain, which caught fire, and on pulling it down he burnt his hands, and rushed into the bedroom with his fingers black as coals, more like an Othello than a mineralogist.

Ilse related nothing of her short career, but she had also had some experience. True, her husband was very good about working at night, was very discreet over his wine, though on great occasions he drank his glass bravely, as became a German Professor. But as to his eating, matters were very unsatisfactory. Certainly it does not do to care too much about food, especially for a Professor, but not to be able to distinguish a duck from a goose is rather discouraging for her who has striven to procure him a dainty. As for carving he was useless. The tough Stymphalian birds which Hercules destroyed, and the ungenial Phoenix, mentioned with such respect by his Tacitus, were much better known to him than the form of a turkey. Ilse was not one of those women who delight to spend the whole day in the kitchen, but she understood cooking, and prided herself on giving a dinner worthy of her husband. But all was in vain. He sometimes tried to praise the dishes, but Ilse clearly saw that he was not sincere. Once when she set a splendid pheasant before him, he saw by her expression that she expected some remark, so he praised the cook for having secured such a fine chicken. Ilse sighed and tried to make him understand the difference, but had to be content with Gabriel's sympathizing remark: "It's all useless. I know my master; he can't tell one thing from another!" Since then, Ilse had to rest content with the compliments that the gentlemen invited to tea paid her at the table. But this was no compensation. The Doctor also was not remarkable for his acquirements in this direction. It was lamentable and humiliating to see the two gentlemen over a brace of snipes which her father had sent them from the country.

The Professor, however, looked up to the Doctor as a thoroughly practical man, because he had had some experience in buying and managing, and the former was accustomed to call in his friend as an adviser on many little daily occurrences. The tailor brought samples of cloth for a new coat. The Professor looked at the various colors of the samples in a distracted manner. "Ilse, send for the Doctor to help me make a choice!" Ilse sent, but unwillingly; no Doctor was needed, she thought, to select a coat, and if her dear husband could not make up his mind, was not she there? But that was of no avail; the Doctor selected the coat, waistcoat, and the rest of the Professor's wardrobe. Ilse listened to the orders in silence, but she was really angry with the Doctor, and even a little with her husband. She quietly determined that things should not continue so. She hastily calculated her pocket-money, called the tailor into her room, and ordered a second suit for her husband, with the injunction to make this one first. When the tailor brought the clothes home, she asked

her husband how he liked the new suit. He praised it. Then she said: "To please you I make myself as nice-looking as I can; for my sake wear what I have made for you. If I have succeeded this time, I hope that I may in future choose and be responsible for your wardrobe."

But the Doctor looked quite amazed when he met the Professor in a different suit. It so happened, however, that he had nothing to find fault with; and when Ilse was sitting alone with the Doctor, she began—

"Both of us love my husband; therefore let us come to some agreement about him. You have the greatest right to be the confidant of his labors, and I should never venture to place myself on an equality with you respecting them. But where my judgment is sufficient I may at least be useful to him, and what little I can, dear Doctor, pray allow me to do."

She said this with a smile; but the Doctor walked gravely up to her.

"You are expressing what I have long felt. I have lived with him for many years, and have often lived for him, and that was a time of real happiness to me; but now I fully recognize that it is you who have the best claim to him. I shall have to endeavor to control myself in many things; it will be hard for me, but it is better it should be so."

"My words were not so intended," said Ilse, disturbed.

"I well understand what you meant; and I know also that you are perfectly right. Your task is not alone to make his life comfortable. I see how earnestly you strive to become his confidant. Believe me, the warmest wish of my heart is that in time you should succeed."

He left with an earnest farewell, and Ilse saw how deeply moved he was. The Doctor had touched a chord, the vibration of which, midst all her happiness, she felt with pain. Her household affairs gave her little trouble, and all went so smoothly that she took no credit to herself for her management. But still it pained her to see how little her work was appreciated by her husband, and she thought to herself, "What I am able to do for him makes no impression on him, and when I cannot elevate my mind to his, he probably feels the want of a soul that can understand him better."

These were transient clouds which swept over the sunny landscape, but they came again and again as Ilse sat brooding alone in her room.

(To be continued.)

For modes of faith let graceless zealots fight,  
He can't be wrong whose life is in the right.

—Pope.

## WEBSTER'S UNABRIDGED

In various Styles of Binding.

Besides many other valuable tables, the latest issue of this work contains

## A Dictionary

118,000 Words, 3000 Engravings.

## A Gazetteer of the World

of 25,000 Titles, (recently added) and

## A Biographical Dictionary

of nearly 10,000 Noted Persons.

## All in One Book.

Webster is Standard Authority in the U. S. Printing Office, and with the U. S. Supreme Court, and is recommended by State Superintendents of Schools in 36 States. Published by G. & C. MERRIAM & CO., Springfield, Mass.

## A Library in ITSELF.

The Latest Edition has

## 3000 more Words,

in its vocabulary, than are found in any other American Dictionary, and nearly three times the number of Engravings.

In quantity of matter, it would make 75 12mo volumes usually sold for \$1.25 each.

It is an ever-present and reliable school-master to the whole family.—S. S. Herold.

## PAMPHLETS ON LIVING QUESTIONS.

Truths for the Times. By Francis Ellingwood Abbot. "The great inspiration of the nineteenth century is faith in the ideal unities as possible in fact." Price, 10 cents; 10 copies, 50 cents; 100 copies, \$1.00.

Fear of the Living God. By O. B. Frothingham. Price, 5 cents.

Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents; 10 copies, 50 cents.

Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.

God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 50 cents.

Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.

The Present Heaven. By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.

The God of Science. By Francis Ellingwood Abbot. Price, 10 cents.

On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.

A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.

The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents; 100 copies, \$1.00.

The Bible and Science. By John Weiss. Price, 10 cents.

The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.

Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.

The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.

A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

CHARLES H. KERR &amp; CO., Publishers.

175 Dearborn Street, Chicago.

## Contents of Recent Numbers.

## BODY AND MIND: OR, THE DATA OF MORAL PHYSIOLOGY.

FELIX L. OSWALD, M. D. In Nos. 27, 29, 31, 33, 34, 36, 38, 40 and 42.

The Science of the thousand-fold moral effects of physical causes is still a sealed book to a large plurality of our fellow-men. The ethics we have inherited is biased by the tenets of an anti-physical and anti-natural philosophy, and the tendency of the latter has ever been to sanction and exaggerate the physical effects of moral causes.

Dr. Oswald says: "Our entire system of moral education needs a thorough revision, and the success of urgent social and ethical reforms depends on the radical reconstruction of moral philosophy on a basis of natural science." The subject is treated in the graphic manner which has ever characterized Dr. Oswald's contribution to the Literature of Natural History and Anthropology. It is marked by the usual wealth of illustration and abounds in felicitous and pertinent citations of historical and natural evidence.

## THE FUNDAMENTAL PROPERTIES OF MATTER.

J. G. VOGT.....In Nos. 29, 31 and 33.

To the *Kinetic* conception of the world's mechanism Vogt opposes his hypothesis of a *continuous* world-substance completely filling space and whose sole manifestation of power consists in *contraction* or *condensation*. He claims that the kinetic or mechanical theory which explains organized and spiritual phenomena from inelastic atoms and a purposeless force, is untenable; and that pseudo-monism which transforms the most complex conditions and processes of psychical life into the elementary substance itself, involves the fallacy of idealism and dualism. As opposed to both views Vogt profoundly his conception which he calls Monism of Reality. He attributes to matter two fundamental properties, motion and sensibility, and deduces from these elementary properties the higher phenomena of intellectual life.

## FREE-WILL A MECHANICAL POSSIBILITY.

XENOS CLARK.....In No. 39.

Mr. Xenos Clark here presents in an interesting and attractive manner certain scientific analogies bearing upon Free-Will and Determinism. A novel and ingenious application is made here of the theory of linkages and link-work which of late has so interested mathematicians and been developed with such striking success by Prof. Sylvester. The article will be found to be unusually suggestive, although it is not in concord with *The Open Court*, which, in an editorial of No. 33, admits the truth of both *Free-Will* and *Determinism*.

## ECONOMIC CONFERENCES.

WHEELBARROW.....In Nos. 37 and 40.

The Economic Conferences of Chicago may be hailed as a significant indication of a breach in the barrier between Labor and Capital. The conferences have served as a medium for the open exchange of opinion, where both sides are fairly represented. Wheelbarrow's criticisms are acute and pithy, and merit a careful perusal. The author unites Old Saxon Simplicity, sincerity of heart, the truthfulness of honesty and warm sympathy for justice and right.

## THE ANIMAL SOUL AND THE HUMAN SOUL.

CARUS STERNE.....In Nos. 37, 41 and 43.

An essay full of fine thought and psychological depth. Carus Sterne well understands to follow a subject as historically developed in the realm of human opinion and as ultimately affected by the light of Modern Science. The question of the relation of the animal to the human soul has ever been of interest and in this essay we find it attractively yet accurately treated.

## PLANTATION FOLK-LORE.

L. J. VANCE.....In No. 41.

Mr. Vance reviews and discusses the movement and widespread interest in popular tales which has produced the recent collections of Negro Myths by Joel Chandler Harris ("Uncle Remus") and Mr. Charles C. Jones. These tales form an important addition to the Folk-Lore of the New World, and Mr. Vance's review will be welcomed by all who wish to acquire a comprehensive estimate of the significance of these Myths to comparative literature and the science of comparative ethnology.

## "HOME CIRCLE"

on trial 3 months, and Life of Henry Ward Beecher, for only 25c., silver or stamps.

Address

SNOW HILL, TENN.

**"HAMMOND"****TYPEWRITER****CABINET.**

or **J. WALTER THOMPSON,** (Times Building),  
NEW YORK.

In an intelligent review of Max Müller's Introductory Lectures on the "Science of Thought," published by THE OPEN COURT PUBLISHING CO., Mr. Ernst says in the Boston Beacon:

"Max Müller's supremely simple theory is hotly disputed. \*\* but it is easily vindicated, provided one is not a dualist on principle. \*\* Max Müller explains with a master's clearness and firmness what has barely been hinted at in these columns. Now, as a matter of fact, half the trouble in life, half the lawsuits in our courts, and most of the quarrels in society arise from the petty fact that men and women, the college graduates not excluded, are not sufficiently acquainted with their own language. They think they know what they say; but until one really knows what one says,—precisely as the banker uses figures in a cheque,—there will be trouble."

## The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

THE OPEN COURT PUBLISHING CO.

169-175 La Salle Street. Chicago.

Neatly Bound in Cloth. Price, 75 Cts.

The study of language is of interest to the lawyer as well as the clergyman, the scientist as well as the teacher, and no education is complete without it.

Max Müller says in this most instructive and interesting book:

"Try to reckon without numbers, whether spoken, written, or otherwise marked, and if you succeed in that, I shall admit that it is possible to reason or reckon without words, and that there is in us such a thing, or such a power or faculty, as reason apart from words. \* \* \*

"People do no longer believe in witches nor in ghosts. But the belief in disembodied thought will die very hard. \* \* \*

"As little as we possess a thing called hunger because we are hungry, do we possess a thing called reason because we are rational. Why, then, should we write it with a Capital R, and make a goddess of Reason and worship her, as she was actually worshipped in the streets of Paris? \* \* \*

## THE MASSES AS REFORMERS.

BY MORRISON I. SWIFT.

The hopes and efforts of Jesus were centred chiefly in the poor. Few do not know this, and yet only here and there does anyone perceive the bearing of that choice of the incomparable teacher's upon social reform of our own time. The pith of Christ's insight was this: that the poor can be utterly devoted to whatever promises improvement, whereas the rich are either taken up with other things, or else they think that general betterment means loss to them.

Our age differs from that of Christ in that the desire for general good is shared by many of the prosperous classes. Bearing this difference in mind the lesson which we of to-day seem reluctant to learn from Christ's method is willingness to use to the utmost the raw reformatory power that lies latent in the so-called masses. In our period of advanced culture this is singular. It is not owing altogether to ignorance, for nearly every intelligent person, in perfectly honest and private conversation, admits that our present society is miserable. It is due mainly to ignorance united with dread and a surviving selfishness.

These barriers should be removed to level the way to progress. The greatest of ignorances is the failure to perceive that reform is the great duty to which all men are called: the continual improvement of whatever is. To dread reform is to misunderstand. Whatever is imperfect in society is injurious to all classes. A reform at one point reaches every point. Hence, selfishness, which opposes innovation and change, is mistaken and narrow-sighted. It is the duty of the hour to make this principle, *that reform benefits all*, known and proven to every class and individual. By this method the desire for reform is to be extended.

But suppose this diffusion of knowledge failed to create a thirst for advancement. The method of Christ remains. Reformers may turn from the stolidly prosperous to the ill-to-do. The awakening masses are the raw material for reform.

The day has come when men seek for absolute justice. "Labor, the world over, has always in different degrees been the servant of capital; and generally, when not enslaved by law, the remuneration has been so slight that accumulations were nearly impossible. Any untoward circumstance might then reduce the la-

borer to destitution; and if destitute he might better be slave than free, for the slave must be supported by the master, when the free laborer might be left to starve."\* Is this justice? Is it possible for men who desire the improvement of the race to longer acquiesce in a social order that involves and sanctions this degradation of the majority? The characteristic of the present social agitation is that there are now many who will not acquiesce. They are convinced that the claims of the down-trodden must at last be heard, that the purer morality that is now stirring in the world will permit no further compromises for the suppression of one class for the advantage of another. The new morality cannot be partial to any individual and yet true to itself. It therefore declares that all privileges which give to the few an unearned and undeserved advantage must be withdrawn. It demands this on the ground of inherent right, and as the one means of bringing about the *genuine* good of all.

It is strange that thinking men should wait for the masses to *demand* their rights. Why is it not recognized that it is the duty of the more advanced to raise others to their level; that those who enjoy privileges that have descended to them from more barbarous times, are under the sternest obligation to renounce these privileges if they cannot be conferred upon their fellows? And yet, by most people, the action of the laboring classes, who are now clamoring for their rights, is denounced. The masses ask simple justice. In return they are treated as foes of order and right. Are they arrayed against goodness because they are tired of being "the servant of capital," and because they are at length becoming intelligent enough to see that when their remuneration is so slight as to make accumulations nearly impossible, they are not justly used? We are reminded of a significant sentence of Mr. Herbert Spencer's: "The sinecurist thinks himself rightly indignant at any disregard of his vested interests." Those who seek what the decrees of common morality award to them, are the friends of a settled peace and prosperity. The enemies of righteousness and of humanity and peace are those who seek to retain advantages that custom has conferred upon them at the expense of their less fortunate fellows.

\*Judge T. M. Cooley: "Labor and Capital before the Law"—*North American Review*, December, 1884.

Truly, there is no longer excuse for a timid utterance of conviction upon this subject. Men of all classes must be plainly taught their rights and assisted to obtain them. Note the situation: one class of men are being treated with wholesale injustice. They are ignorant and self-distrustful, and if not helped from without the wrong they suffer must go on; if informed of their rights and enlightened, they will be encouraged to undertake the contest for liberation. Is there any doubt that they should be amply taught and their efforts stimulated and supported? But it is dangerous, we are told. Dangerous to what? Dangerous to the continuation of injustice, and to those who uphold unrighteous practices. It is within the power of those who are endangered to avert the danger. If they confuse traditional privileges with rights and will not yield to reason, shall they be allowed to decree deprivation and suffering to half the race until such a time as they may be pleased to see and voluntarily perform their duty? The plea for silence and repressive conservatism comes to nothing less than this. But such persons wrong the new conscience and solicit the impossible. The paramount duty of to-day is reform and no class must be permitted to restrain it.

But, we hear it said, there is danger in a larger sense. The equilibrium of society may be lost in a violent outbreak of passion and its even, though gradual, development for a long time checked. This opinion numbers many supporters and they even deprecate a public discussion of the difficulties in which society has become involved, lest some one shall be aroused. 'Surely every sensible and observing man,' it has been said, 'knows that these articles\* feed the flames of anarchical discontent all over the country; that there is nothing more mischievous than persuading ignorant men that they are suffering from evils for which nobody knows any peaceful remedy.' From the point of view of those who live on the labor of others it is supremely mischievous. But peaceful remedies are known and it awaits only the pleasure of the luxuried and propertied classes to adopt them. It is very singular for these classes to pose as the defenders of peace. The silence in which they would fain shroud their graspingness and iniquity merits of all proposals the sternest rejection. Ostensibly its aim is peace, but the near future only concerns it. If intelligent people relapsed into passive spectators and uttered hereafter no word of complaint or enlightenment, if they even made themselves pliant instruments in the hands of the industrial lords and their yachting, care-free, dividend-drawing children and children's children, and spent their truth-loving, heroic, useful lives in proving to the crushed poor that broadcloth is cheaper than it was and that they have no grievances, the revolutionary fires that have been lighted would

probably smoulder for a longer time, but at length they would break forth with ten times aggravated and quenchless fury. The experience of ages should have taught the insanity of this policy. Making specious pretensions to peace it subverts it. To be silent and inactive because the end of the way of life is lost in the dimness of distance is as wise as if a diseased man were to refuse all remedies or the discussion of his malady until an infallible cure should be discovered. The entrance to the way of life lies close before us and many steps are plain. Our hushed despair or silencing greed for more time to gather spoils delays our entrance, but it should be remembered that the Nemesis we tempt is not soothed by the mere passage of time. Retribution or expiation through justice awaits us. In Germany, many people see that a revolution is approaching, but they say, "Let us support the army and keep it off until we are dead." Many of us are like these pusillanimous Germans. We wish to be rich and enjoy ourselves, and to let another settle the cost. If we sincerely desire assured and lasting peace it can be secured only by admitting and removing social grievances. We leave this duty to others only at our peril and theirs. The policy of repression is not the policy of peace.

Society contains a species of persons whose characteristics have been at no time veiled in obscurity. Their motive is the exaltation of self, and no solicitation for others restrains them. Were we to fold our hands and await the softening of their hearts, we may be sure that amelioration would never come. These people are aroused to unselfish action only by the stress of legal enactment, or public sentiment, or imminent force. It would be preposterous to allow this class to plunge the whole of society into disaster. They must be made to bow their ambition to the general welfare, and it is by discussion, by enlightening all classes upon the subject of social wrongs, that this end is to be gained. The dangerous classes are not the poor. They are these arrogant obstructionists. They make revolution and violence almost inevitable and coolly transfer the entire responsibility to those whom their abominable injustice has made desperate. Then they say, 'Do not tell ignorant men that they are suffering or they may become discontented and dangerous.' This is prodigious effrontery. In this social crisis men of such stamp are public enemies. They aver that a statement of facts will precipitate a revolution, and they go on creating the revolutionary facts. Let us publish the truth and place the responsibility where it belongs. Let us have a revolution if there are not enough men of character to effect reform by quiet means.

But our hopes are buoyant because we live in America. The duke of Marlborough visits Chicago and remarks upon 'the contrast between the masses of

\* Those that describe the social injustice.

America, meaning the working classes, and those of Europe. Here they are better clothed and fed, and live more comfortably and in better houses. The average of intelligence here is much higher than in England.\* The foreign nobilities know these things and yet they continue. London has its recurring riots from men who cannot get bread, but in the higher circles expenditure for luxuries is not one whit less profuse. We shall not be greatly surprised at a revolution abroad. But the conditions are more favorable here. Trained under different ideas, as the great body of Americans have been, we may still hope to see justice peaceably done.

The masses are the modern opportunity. Those who wish improvement must join hands with this class, must show them what they can now do for society and themselves by patience and resolution, must elaborate and execute methods by which they can be educated and prepared for their mission while elevating themselves in the very process of preparation for larger achievements. Social advancement is for the interest of the masses; the class that opposes them wrongly imagines that it is to be sacrificed in this progressive movement. The masses have faith that immense social progress is possible; the well-to-do are skeptical and pessimistic on this point. The masses are not wedded to the numerous social customs of other classes, that are known to be destructive of vitality and are nevertheless steadily persisted in. They have not crystallized in favor of any scheme or theory of education, whether injurious or not, and they are rapidly freeing themselves from the cramping influences of theological dogmatism. In a word, they are nearer the earth, and except for overwork and insufficient food they are healthier, and, therefore, of better race material. They are more natural, and they stand nearer the solid realities of life. Their vital principle is better and they will rear tough children in the midst of hardship and unsanitary conditions to which those cradled in luxury would immediately succumb. Their minds are more fluid and therefore they are more capable of growth into a surviving harmony with the conditions of life, than those whose adaptations were formed earlier and in less enlightened times. It remains for them to apply these advantages to useful ends. Their day is dawning; they are to become an infinitely more important factor in the life of the race than ever before; it rests with them to show how far they can carry humanity in its upward course.

Evil events from evil causes spring.

—Aristophanes.

He who does evil that good may come,  
Pays a toll to the devil to let him into heaven.—Hare.

## BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.

BY FELIX L. OSWALD, M. D.

PART X.

### EDUCATION—Continued.

The chief purpose of systematic gymnastics is the uniform development of the muscular organism, and "all-round athletes," as our professional trainers call them, often become the finest specimens of physical manhood; but they rarely attain supremacy in the mastery of any special exercise. In the results of mental and moral education, too, the pre-eminent development of any special faculty generally indicates one-sidedness of culture. The moral sympathies, as well as the intellectual and physical energies, can become specialized. The Spanish conquerors of the New World treated the aboriginal population very much as the settlers of a primeval forest treat the wild beasts and birds of the wilderness; but their race-prejudice by no means implies an absolute deficiency of the social instinct, and travelers in South America agree that the aristocratic planters of the slave-states treat a white visitor with a chivalrous hospitality almost unknown in countries of social equality and freedom. There was a time when the hatred of foreigners was encouraged as a civic virtue. To the Romans of the early republican era every alien was an enemy. The Greeks of the classic age of Hellenic civilization despised all non-Grecian nations as barbarians. Prisoners of war were generally enslaved; but that era of national antipathies was at the same time the golden age of patriotism and friendship. Altruism had become specialized, but within its limited sphere acted with an intensity unknown to our latter-day ethics of cosmopolitan philanthropy. "Traveling," says Thomas Jefferson, "makes men wiser, but less happy. They gather knowledge, but they are, after all, subject to recollections mixed with regret; *their affections are weakened by being extended over more objects.*" When the social sympathies are concentrated upon a single tribe of the human race, Jonathan, Pylades and Atticus can claim a share of those affections which in an age of cosmopolitan tendencies becomes diffused to a degree incompatible with intensity of devotion; and a recognition of that fact may have inclined the apostle of universal love to discourage individual attachments. "He who hates not his father, mother, sister and brother, cannot be my disciple." The celibacy of mediæval anchorites and modern priests is the natural outcome of that tendency.

The tenet of universal brotherhood was, indeed, specially obnoxious to the national patriotism of antiquity, and it must be admitted that the age of monastic ethics produced but few great patriots; though, on the other hand, religious fervor assumed a degree

of intensity wholly unknown to the contemporaries of Regulus and Miltiades. Specialized education produced those heroes of civic virtue who stood ready to save their country in despite of fortune and fate, and specialized education of a different type produced those martyrs of faith who preferred the interests of a dogma to the temporal welfare of their friends, families and countrymen. Cato and Aristides were embodiments of republican patriotism and heroic manhood; Symon Stylites and Louise Lateau were embodiments of world-renouncing faith. Their equal faculties of self-denying devotion had been developed in diametrically opposite directions.

The functions of the intellect, too, can thus be limited to narrow grooves, and may be almost wholly excluded from special spheres of activity. There are monomaniacs who appear perfectly rational till the cross-examiner happens to touch their "sore spot"; and specialized education seems almost to have incapacitated certain minds from logical reasoning upon special topics. Their mental vision, as it were, *con-nives*, at the absurdities of their tenet, they refuse, not only to admit, but even to examine and consider the arguments of their opponent. "If so rude a comparison be permitted," says Dr. Carpenter, "just as we try if a new piece of furniture which is offered us does or does not fit into a certain recess in our apartment, and accept or decline it accordingly, so we try a new proposition which is offered to our mental acceptance. If it fits into some recess in our fabric of thought, we give our assent to it, by admitting it to its appropriate place. But if it neither fits it, nor can be brought to fit, the mind automatically rejects it."

Educational prejudices long disqualified the minds of our forefathers from accepting the most cogent arguments in favor of woman's rights, and for nearly seven centuries private doubts in the unspeakable absurdities of the witchcraft delusion were at once suppressed as heresies unworthy of serious discussion. Jean Bodin, in his diatribes against the skeptics of northern Europe, could justly claim that "no other crime ever punished by the law of Christian courts, has in all its details been established by a more abundant accumulation of evidence than the crime of sorcery." Not only was the possibility of witchcraft in full accordance with the dogmas of the dominant creed, and the carefully inoculated tenets of a vast plurality of the Christian population, but the belief in that reality seemed supported even by the evidence of the senses, as recorded in the testimony of innumerable eye-witnesses. Not the mental, but the bodily eye had seen demons materialized at the behest of the enchanter; witches had been watched in their aerial excursions or in the act of brewing storms from a potfull of soap-suds, ears had heard the voice and hands felt

the claws of the *incubus*; the archfiend himself had appeared in bodily form and tried the charm of his sophisms or bribes on a shuddering audience. Such visions were not the exclusive privilege of idiots and hysteric nuns. The spirits invoked by the incantations of the wizard Tauler, appeared to many of his learned friends. Thomas Aquinas details an interview with the familiar of a female relative, and Dr. Nicholas Remigius, judge of the criminal court of Lorraine and a man of vast erudition, devoted his own person to a death of torture by reporting his success in raising the spirits of the dead. The re-embodied souls of departed criminals, he said, had visited his study and given him a circumstantial account of their hardships in Hades. On one occasion an apparition of that sort had blistered his skin by touching him with a hand still grimy with the superheated soot of Gehenna. It would be preposterous to ascribe such assertions to intentional deceit, and the only alternative explanation can be found in the theory that the senses of the physical organism were perverted by the influence of intense conviction, aided perhaps by the influence of vivid expectancy. A curious instance of the power which such influence may acquire even on the minds of unprejudiced persons, is quoted by Professor Tuke, upon the testimony of numerous witnesses: "During the conflagration at the Crystal Palace in the winter of 1866-67, when the animals were destroyed by fire, it was supposed that the chimpanzee had succeeded in escaping from his cage. Attracted to the roof, with this expectation in full force, men saw the unhappy animal holding on to it, and writhing in agony to get astride one of the iron ribs. It need not be said, that its struggles were watched by those below with breathless suspense, and, as the newspapers expressed it, with "sickening dread." But there was no animal whatever there, and all this feeling was thrown away upon a tattered piece of blind, so torn as to resemble, to the eye of fancy, the body, arms and legs of an ape."

Currents of thought, persistently concentrated upon a single object, may similarly bias the testimony of the bodily senses. In dreams all vivid thoughts become visions, and the delusions of an excited imagination have been well defined as "day-dreams." Sir Walter Scott, in his "Demonology and Witchcraft" (p. 45), describes the emotions awakened by the news of Lord Byron's death, and how he passed many hours in reading an account of the personal habits and peculiarities of his departed friend. Soon after, on crossing a hall, ornamented with relics and curiosities of natural history, he saw, with his bodily eyes, the subject of his reveries standing before him, a materialized phantom of the mind, true to life in the veriest details of feature and dress. "He stopped for a moment, so as to notice the wonderful accuracy with

which fancy had impressed upon the bodily eye the peculiarities of dress and posture of the illustrious poet. Sensible, however, of the delusion, he felt no sentiment save that of wonder at the extraordinary accuracy of the resemblance, and stepped onwards toward the figure, which resolved itself, as he approached, into the various materials of which it was composed. These were merely a screen occupied by great coats, shawls, plaids, and such other articles as are usually found in a country entrance-hall. He returned to the spot from which he had seen the phantom and tried with all his might to recall it by the force of his *Will*, but in vain,—a good illustration of the slight influence of volition over imagination, compared with that of a mental image or idea acting upon the sensorial centres, and distorting or moulding into other forms the impression received from objects of the senses."

Our mediæval forefathers accepted the dogmas of their ghost-creed as modern scholars accept the axioms of mathematics and chemistry. Besides, the supposed ineffable importance of those dogmas kept the mind constantly riveted upon their objects. There is no doubt, therefore, that educational influences alone can abundantly explain all the prodigies of supernaturalism that turned the Middle Ages into a perpetual Witches Sabbath of unearthly apparitions.

Educational prepossessions alone, can equally well account for differences of opinion upon many subjects of modern controversies, which to one type of minds seem to furnish abundant demonstration of tenets wholly rejected by another. To a docile disciple of European absolutism, for instance, the divine right of kings and the duty of subordination to the ordinances of established governments seem equally self-evident. To an American democrat of the Jeffersonian school the belief in those rights and duties seems a pitiable relic of Mediæval barbarism. Modern theologians still extol the sublimity of scriptural rhetoric as incomparably superior to the grandest products of secular literature. With the same emphasis of honest conviction the disciples of Voltaire execrate that rhetoric as a mass of sickening rant, as inferior to the diction of pagan orators as the sculptures of a Fijee fetich-maker are to the masterpieces of Phidias and Praxiteles.

The language of sincere enthusiasm cannot be imitated by the sophisms of hypocrisy, and nothing but a *contrasting bias of mental vision* will explain such extremes of dogmatic divergence as those of the subjoined rhapsodies, which, as *ne plus ultras* of their kind, deserve attention and commemoration. Two representative American journals of nearly the same date, publish the following "defence" and "exposure" of modern spiritualism: "Spiritualism teaches us to

love our fellow men and leave the world better than we found it. The bright, pure, and loving, the grand in wisdom, the strong in power, will claim brotherhood with such humanity. Mediums will grow into angel instruments, and circles will lift men heavenward. The inner life of the mortal shall be aflame with light from spheres where Nature and man dwell together in eternal harmony. And this is the fruit of modern Spiritualism when sown in the heart of any man or woman who would fain climb heavenward." (*Religio-Philosophical Journal*, May 19, 1888.)

"Of all impositions, of all frauds, of all gross deceits and villainous humbugs practiced in the world, those by Spiritualistic mediums are the foulest and worst. The bunco-steerer, the confidence man, the green-goods merchant and the monte-sharp only rob their customers of money by false pretense; while these swindlers, playing upon the hopes and fears of weak hearts, trifling with the grief of the widow and the stricken mother, and employing as their agent the agony of every anguished heart whose treasure is in the grave, not only extort money by vile trickery, but often drive their deluded victims from health and wealth into poverty and disease, and finally rob them of their reason and drive them to the madhouse. This is not exaggeration but simple fact. Our wise legislators have provided means for the punishment of other swindlers, but these miscreants are allowed to practice under the protection of the law. Again and again have they been exposed. Again and again the whole fabric of spiritualistic manifestations has been shown to be deception and trickery; homes have been ruined, fortunes lost, evils innumerable wrought in families upon which the curse of credulity has fallen, and still not one step taken towards the protection of the community from the gang of charlatans invading it." (*N. Y. World*, quoted in the *New Yorker*, May 26, '88.)

If educational bias can inspire such diverging views on questions open to contemporary tests of evidence, shall we wonder at the difference of opinion concerning the historical enigmas of bygone centuries or the interpretation of ancient dogmas?

#### AGNOSTICISM AND RELIGION.

A DISCUSSION OF THE FIELD-INGERSOLL CONTROVERSY AND OF MR. GLADSTONE'S REMARKS UPON THE SAME.

(Concluded.)

The test which should be applied as to whether a religion is true or false, is still the same as was recommended almost two thousand years ago by Christ, when he said: "Ye shall know them by their fruits." And on this main subject our doughty champions agree, but they ignore their agreement as much as possible, mentioning it only incidentally. Mr. Field says to Col. Ingersoll (on p. 138):

"You professed great respect for the Ethics of Christianity, and for its Author. 'Make the Sermon on the Mount your religion,' you said 'and there I am with you.'"

Col. Ingersoll himself makes a similar concession (on p. 502):

"If you mean by 'a power making for righteousness' that man, as he becomes civilized, as he becomes intelligent, not only takes advantage of the forces of Nature for his own benefit, but perceives more and more clearly that if he is to be happy he must live in harmony with the conditions of his being, in harmony with the facts with which he is surrounded, in harmony with the relations which he sustains to others and to things; if this is what you mean, then there is 'a power making for righteousness.'"

These points of agreement, important as they are, have been merely touched upon, and come in as if by chance; they are choked by the briars and brambles of a passionate pleading for the side issues of the debate. Mr. Field cannot separate this idea of a power making for righteousness in Nature from the belief in a personal and supernatural God. Because there is a power making for righteousness *in* nature, he speaks of "a power making for righteousness *behind* nature." And if Col. Ingersoll insists "that there can by no possibility be any evidence of the existence of such a power" (supposing that it is "something supernatural back of Nature"), Mr. Field declares that the Colonel's views undermine morality.

Mr. Field evidently limits the conception of nature to the very lowest natural manifestations. The moral nature of man is to him supernatural, and he conceives it not as an outcome of the natural, but as something essentially different from nature, which originates in the non-natural.

Col. Ingersoll, on the other hand, identifies religion with superstition. Christ has characterized his view of religion as Love of God and man\* and the love of God is proved by doing the will of his Father in Heaven or in other words by leading a moral life.

In speaking of Christianity, Col. Ingersoll should judge of it as it has been defined by its founder. He should take it in its noblest and highest conception. But Religion is to him superstition, for "religion has to do with the supernatural."† He says "Christianity, superstition—that is to say the supernatural. . ." (p. 499). That the central idea of all religions is man's aspiration to live morally and to remain in harmony with the surrounding facts of Nature and of human society—is only touched upon in the passage quoted above and then it is ignored. And because this central truth of religion is interwoven with errors, because

most Christians have not yet freed themselves from the crude notions of supernaturalism, Col. Ingersoll rails at religion itself with a vengeance.

Supernaturalism is by no means an essential element of religion. There are religions which are not supernaturalistic, the pagan religions of Nature worship and Buddhism. We must object to both for reasons which do not lie within the scope of our present discussion. The French philosopher Auguste Comte has founded a religion of positivism, and THE OPEN COURT propounds a religion of Monism. Both are religions which have nothing to do with the imaginings of a dualistic supernaturalism. The religion of Monism, as a matter of principle, excludes the dualistic notions of superstition; it takes as its basis the unitary conception of modern science and finds in this view the best support and confirmation of the fundamental truth of religion—of ethical religion. If Col. Ingersoll hates superstition, he should object to the supernatural notions in Christianity; but must the wheat, too, be rooted up with the tares because they grow by the side of one another on the same field?

It is not to be expected that any one of the disputants will yield to the propositions of his adversary, but it is to be hoped that the progress of religious thought will be greatly benefited by the discussion. The truth in which both parties agree will remain and will shine even brighter than before. The errors common to both will disappear; they must destroy one another. And those truths which were recognized by one or the other party from a one-sided standpoint—truths which seemed contradictory—will after all be recognized as not only reconcilable to, but even complementary of, one another.

The truth in which both parties agree, is the recognition of a moral law in Nature to which man has to conform in order to live, in order to live well, and to be blessed. This truth lies at the bottom of all religions and gave to all religions their ethical import. The superstitions which threatened to smother true religion were an outgrowth of the insufficient knowledge of darker ages, but they will disappear with the advance of science. Truth is stronger than error; truth need not fear to perish in a world where the fittest survive, for truth is the fittest and it will ultimately conquer in the struggle for existence.

The servants asked the householder:

"Wilt thou then that we gather up the tares," but the householder answered them and said:

"Nay; lest while ye gather up the tares, ye root up also the wheat with them. Let both grow together until the harvest; and in the time of harvest I will say to the reapers: Gather ye together first the tares, and bind them into bundles to burn them; but gather the wheat into my barn."\*

Not unlike the zealous servants of the householder

\* St. Mark 12, 28—32.

† I find for instance no supernaturalism in the Religion of Friends as explained by David Newport on page 1061 of THE OPEN COURT. Our correspondent's view of Christianity widely differs from what Col. Ingersoll characterizes and criticizes as Christianity.

\* St. Matthew 13, 29—30.

in the Gospel, Col. Ingersoll would fain root out the wheat with the tares; he would take away religion with superstition; and on the other hand, the ecclesiastical defenders of traditional belief feel inclined to disparage that radical love of truth in the hearts of infidels. It appears to their dim eyes as tares, but it is genuine wheat of purest and most earnest religious zeal. Let the wheat and the tares grow; soon they will easily be distinguishable from one another.

Religion as the recognition of the ethical law in Nature will not be destroyed; it cannot be destroyed; and it will be more and more generally acknowledged. This religion will spread in proportion as the errors prevalent at present disappear. And the fundamental error, in which both antagonists are equally entangled, is the agnosticism of our time.

The agnosticism of Col. Ingersoll, of Mr. Gladstone and Dr. Field, does not mean that they are ignorant on certain topics only, and that they have not yet solved the religious problem; it means that the problem is insolvable. It does not merely mean that the mysteries of life are wonderful, that the world is marvelously grand, that the range of inquiry in nature is unlimited, that the solution of each problem presents new food for inquiry—all these truisms do not exclude the possibility of knowledge. Agnosticism means that the mysteries of nature *can not* be explained, and that its problems *can not* be solved.

Agnosticism appears at first sight as an expression of most sensible modesty. Who can blame a man for openly acknowledging his ignorance and who can doubt his sincerity? Socrates has been much admired for his confession, 'I know that I do not know anything!' But the agnostic outdoes Socratic wisdom and forfeits all claim to modesty by declaring that no one else can know anything about the mysteries which he himself can not explain. By changing the Unknown into the Unknowable, the agnostic does what so many hierophants and priests have done; he establishes a narrow and unwarranted dogmatism upon the firm basis of his own and other people's ignorance. And furthermore, by making of the unknown the Unknowable, the agnostic introduces into the world-problem a second magnitude, a something which is essentially different from knowable nature. The dogma of the Unknowable stamps on agnosticism the features of dualism.

This dogmatism which scientifically attempts to sanction systematic ignorance *is as injurious as any religious superstition*. It prevents progress. Goethe says: "Man must hold firm to the belief that what appears incomprehensible to him is comprehensible, since otherwise he will not investigate."\*

The agnosticism of religious dualism is based on

the belief in a spiritual world which exists somewhere above the material universe and is inaccessible to man. This dualism, which makes of man a double being, a combination of a material body and a spiritual soul, has been the source of many absurdities and superstitions, many of which have been mentioned by Col. Ingersoll. It is this dualism that Col. Ingersoll should attack—not religion, not Christianity! But this dualism is fortified in the sacredness of mysticism, and as long as its mysteries are considered as too profound for solution, it cannot be conquered. Agnosticism confesses its inability to conquer; it confesses that it can not climb the walls of that beyond where dualism keeps all its sacred treasures locked up—a beyond which is called by philosophers transcendent, because they say it transcends all human understanding.

Agnosticism by establishing the dogma of a beyond, by maintaining that a province exists which by its very nature is inaccessible to human investigation, has built a wall of protection for dualism. Within that wall, in the realm of the unknowable, there is room enough for all the goblins and ghosts of superstitious dualism. The agnostic can lay siege to dualism and its errors, he can successfully repel all sallies of dualistic absurdities, but he will never conquer, he will never vanquish his enemy, because agnosticism acknowledges the fundamental principle of dualism; it labors under the same error, as it also believes in, or at least leaves room for, a beyond of unknowable, inscrutable problems.

Mr. Spencer arrives at the idea of the unknowable in the following way:

"For, if the successively deeper interpretations of nature which constitute advancing knowledge are merely successive inclusions of special truths still more general, it obviously follows that the most general truth, not admitting of inclusion in any other, does not admit of interpretation. Manifestly, as the most general cognition at which we arrive can not be reduced to a more general one, it cannot be understood. Of necessity, therefore, explanation must eventually bring us down to the inexplicable. The deepest truth which we can get at must be unaccountable. Comprehension must become something other than comprehension before the ultimate fact can be comprehended."

But granting that an explanation means the reduction of special truths under a more general truth, we must add that the more general truth can afford an explanation only if it is better known and simpler than the more complicated instances of special truths. If this is true, the most general cognition must be the most simple; it must be self-evident as the mathematical axioms. Schopenhauer calls attention to the fact that the whole science of mathematics can not be proven, for it rests on what we call axioms, viz., truths which we take for granted. But is this an argument in favor of agnosticism? Are the ultimate

\* Quoted from the *Basis of Ethics*, E. C. Hegeler. OPEN COURT, page 21.

truths of mathematics inscrutable? Or are they not rather self-evident, so that if they are understood they need no further evidence?

The unknowable is described as the resting place of science and philosophy, but the self-evident, it must be confessed, is a much fitter resting place, which, not unlike mathematical axioms, will prove a better foundation for human knowledge than the vague concept of something inscrutable.

If agnosticism means that absolute knowledge is impossible, we heartily concur. But we must add that absolute knowledge, like everything absolute, does not and can not exist. To speak of absolute knowledge shows a radical misconception of the nature of knowledge. Knowledge is always relative. Subjectively, knowledge is produced through feeling, and through the more complicated, higher evolved form of feeling, consciousness. Objectively, it is possible through the law of cause and effect. Surrounding objects affect our senses; the effects are perceived by our senses, and form the substance of cognition.

It is true that our senses are not subtle enough to perceive all manifestations of reality. We have, for instance, no sense for perceiving the chemical rays of light. But the photographer's sensitive plate is more sensitive than our eye, and will give us satisfactory information on the subject. Thus we have indirect means of ascertaining what is inaccessible to our senses and what at first sight might appear beyond the ken of the human mind. "*Nit hominibus arduum est!*" And we must with Goethe hold firm to the belief that what appears incomprehensible to man is comprehensible.

There is but one objection possible to Goethe's proposition which has been made repeatedly, viz., that we never shall be able to find out the cause of existence itself. This objection falls, if we consider that existence (the existence of the world, of reality in general,) is not a cognition or a truth which can be explained and understood. Existence is a fact. And a fact can not be proven by logical argument; a fact must be stated; it must be stated by experience; and if it happens to be beyond the horizon of our personal experience, it must be established by the evidence of witnesses. The existence of reality is a fact self-evident to every existing creature; and if we consider existence as the manifest and knowable effect of a latent unknowable cause we make a wrong application of the causal law.

Reality is what the German calls *Wirklichkeit*, which means effectiveness or the manifestation of causal effects. The operation of natural phenomena is an uninterrupted chain of cause and effect. Anything that manifests its existence by working effects is not unknowable, for cognition traces the effects to

their causes. Cognition shows how in some process or phenomenon, by a certain change (viz. the cause), some new state (viz. the effect) has and must have resulted from a prior state. Reality, being such *Wirklichkeit* or manifestation of effects, a working of effects, is in itself knowability.

Science teaches that the world is a *cosmos*, which means order. If nature were unknowable, it would be no cosmos but disorder. Order and regularity, law and harmony, are in their very nature cognizable. For cognition is the discovery of order, of law, of regularity.

Suppose we have a problem which is insolvable not by our inability to solve it but insolvable in itself. What would we call a problem insolvable in itself? We should say it is no problem, it is falsely stated, it is wrong in its principle, or even it is unmitigated nonsense. And must the problems of Nature really be considered as such mysterious, inscrutable, insolvable, unknowable puzzles? Certainly agnosticism must be mistaken. The world is not an insolvable problem. Like everything that has sense and meaning, it can be investigated and understood. Therefore, we should cease to worship the unknown; we should cease to look with awe and reverence upon unknowabilities. The Nature of an unknowability is neither divine nor profound, and the term unknowable is applicable only to things that have neither rhyme nor reason.

It is strange that both parties, Mr. Field and Mr. Gladstone, as well as Col. Ingersoll, in spite of their avowed agnosticism pronounce very definite although contrary statements about the unknowable, and they approvingly call to each others minds their confession of ignorance. Through this inconsistency of their agnostic with their religious views, must not one agnostic statement destroy the other, and must not agnosticism consequently disappear? In the interest of human progress it is devoutly to be wished for.

But what will be the result not so much of this discussion as of the conflict of two diametrically opposed views? Will one view entirely destroy and outlive the other, or will they really be merged into one as has happened so often in the development of human ideas? The latter is most probable. When the errors of the two parties are recognized, it will be apparent that the truths of both views are not contradictory.

The fundamental truth of religion will not be swept away, it will be purified; and as one great medium by which this purification of religion is to be performed, we name Col. Rob. Ingersoll, the truth loving blasphemer, the undaunted scoffer of what he believes to be superstition.

Mr. Field says: "You are waging a hopeless

war—a war in which you are certain only of defeat. The Christian religion began to be nearly two thousand years before you and I were born, and it will live two thousand years after we are dead." Christianity surely has existed these two thousand years, but Mr. Field is rightly reminded by his opponent, that the Christianity of to-day is not the Christianity of the middle ages, when witches were burned in *majorem Dei gloriam*. The Christian God of to-day is another God than he whom Peter of Amiens preached in the barbaric times of the sanguinary crusades. And the old Jahveh of the Hebrew is again quite a different character from the transcendental Deity, the soft-hearted philanthropic God of modern Deism—the Deism of the eighteenth century. The old Jahveh is a man with nerve and fibre. He demands obedience and punishes trespassers with strictest justice, for he is, more than Jupiter, Zeus, and Wodan, a God of consequences.

Col. Ingersoll is not yet free from old prejudices against Jehovah. Col. Ingersoll seems to feel that Jupiter is harmless. There is no danger in praising him. But his judgment is not impartial when he speaks of a God who still continues to be a power in many minds. Most of the liberal Jewish Rabbies are in this respect further advanced than Col. Ingersoll. However, Col. Ingersoll is not to be blamed for his prejudice, but those Christians whose motto is *credimus quia absurdum*.

Religion and Christianity will not remain what they have been. A new religion will be born, which must contain all that is true and good in the old religions. Whether, in the development of this new religion, the Unitarians or the Universalists or Episcopalians or the Societies for Ethical Culture or the Free Religions Association or any other church or sect will take the lead, remains to be seen. It is certain, however, that even the narrowest congregations will broaden more and more under the influence of modern science and philosophy.

There is an old Scandinavian saga of a northern hero, to whose soul we are informed were added the souls of those he had conquered. He acquired all the virtues, the strength, and the ability of the enemies whom he had slain. There is a truth in the meaning of this saga. Opponents who fight with one another, adapt much from each other, and it is certain that if, in the Ingersoll-Field discussion, agnosticism should conquer, it would by its very victory adapt the fundamental truths of religion. If, however, the religious party should get the best of it in this struggle, it would necessarily broaden and admit the radicalism of free inquiry. There is no standstill in the development of humanity; not only science, but also religion move onward on the path of progress, and he who knows the

signs of the time, can easily point out the direction of our religious evolution.

In summing up our opinion in this case, we must repeat what we stated in the introductory remarks of the present discussion. Humanity forms a great unity, and the development of human ideas constitutes one great and uninterrupted wave. In the religious evolution of mankind, the negative standpoint of agnosticism as represented by Mr. Ingersoll is, in the interest of religion, very important and beneficial. It represents the *antithesis* to the theological *thesis*.

Agnosticism, being a mere negative view, will not stand; it will die on the very same day that its enemy expires. And the *synthesis* will produce the religion of Monism—a religion purified by criticism from pagan supernaturalism and from the monstrosities of dualism, a religion which is in accordance with science, which is the natural and true basis of ethics—not the cloister ethics of the Middle Ages, but the ethics of practical life. This religion will teach man how to keep in harmony with the conditions of his existence. This religion will elevate man, ennoble his aims, and beautify his life.

## CORRESPONDENCE.

---

### GOETHE'S "THRILL OF AWE."

In the April number of the *Nineteenth Century* Matthew Arnold, while descanting upon the dearth of "provision in American civilization for the sense of beauty," introduces a line and a sentiment from Goethe which has occasioned much comment. The passage in which Mr. Arnold fits the sentiment of the German poet to the purposes of his own criticism reads as follows:

"As to distinction, and the interest which human nature seeks from enjoying the effect made upon it by what is elevated, the case is much the same [*i. e.*, as to beauty and the provision for the sense of beauty.—Ed]. There is very little to create such an effect, very much to thwart it. Goethe says somewhere that 'the thrill of awe is the best thing humanity has:'

*\* Das Schandern ist der Menschheit bestes Theil.\**

"But if there be a discipline in which the Americans are wanting, it is the discipline of awe and respect. An austere and intense religion imposed on their Puritan founders the discipline of respect; but this religion is dying out."

The above citation, from the prominence given it, has been taken by some as revealing a leading tendency of Goethe's character and as affording a test whereby to judge the great German poet. Though Goethe had yielded to the feeling of being overawed, it was remarked by some critics of Mr. Arnold that they would not succumb to this weakness and that they saw no nec-

\*The translation of the above line with context is given respectively by Bayard Taylor and by Anster as follows:

"Notless in terror lies no good for me;  
The chill of dread is man's best quality  
Though from the feeling off the world may fend us  
Deeply we feel, once smitten, the Tremendous."

"Think not in terror that I place my weal  
'Tis man's, 'tis man's to shudder and to feel  
The Human in us, though the world disown  
And mock at feeling, seized and startled thus,  
In on itself by strong revulsion thrown,  
Thrills at the Vast—the Awful—the Unknown."

essity of "thrilling with awe" for old institutions and legendary traditions.

The passage quoted is none of Goethe's best known lines and as the well-balanced mind of Goethe never knew any feeling of being overawed, as he could not so easily be imposed upon by authority or thrilled with reverence, we could not but help thinking that the context would set the word *Schaudern* in another light. So we wrote to our American Goethe scholar, Prof. Calvin Thomas, at the University of Michigan, Ann Arbor, asking where the quotation was to be found and received the following answer:

Dr. PAUL CARUS, Chicago. Dear Sir:—The words of Goethe (that you refer to occur in the second part of *Faust*, first act, line 1660:

"Doch im Erstarren such' ich nicht mein Heil,  
Das Schaudern ist der Menschheit bestes Theil."

This feeling, I should say, was very familiar to Goethe. He was acquainted with it and recognized its importance. Nevertheless, his *normal*, *habitual* way of looking at things was rather the inquisitive and scientific, than the emotional and reverential. Or, perhaps, we should rather say, it was a peculiar blending of the scientific with the emotional.

Take for example that fine saying of Faust (Part II, Act 4, line 57):

"Gebirgsmasse bleibt mir edel-stamm,  
Ich frage nicht woher und nicht warum."

Goethe certainly could and often did feel in this way. But he was also an industrious, practical geologist; wherever he went, he was always pounding at the rocks and bagging mineralogical specimens. As a matter of fact, too, he did take the deepest interest in the "Woher" and the "Warum" of mountain-masses. The real, characteristic "*Anschauungsweise*" of Goethe might, I think, be put in this way: "Zwar bist du mir, wie du bist, ein grosser, wunderbares Geheimnis, aber ich möchte trotzdem etwas von deiner Geschichte wissen. Es wurmt mich, dich genetisch zu erklären." †

Of interest in this connection is Goethe's saying: "Nur Erstarren und Bewunderung führen zu der Heiligung der Kunst." ‡ Compare also the long conversation upon *Ehrfurcht* in the first chapter of the second book of Meister's *Wandernjahre*—a disquisition upon which Thomas Carlyle comments with particular enthusiasm in his "Address delivered to the Students of the University of Edinburgh, April 2, 1866." (The address is printed in Carlyle's works under the title: "On the choice of Books").

I beg pardon for this professorial "*Citatenuth*,"

Respectfully, yours

CALVIN THOMAS.

Faust had to go to the Mothers to invoke the shadow of Helena; and we know that Goethe intended to make the word "Mothers" awe-inspiring and impressive. Faust is thrilled with awe at hearing the word. But it is not respect for antiquity that affects Faust; it is a new and great task and a difficult enterprise, fraught with danger that stirs his mind. No feeling of reverence pervades his soul; it is the transport of excitement that, with the full consciousness of the enormous risk, arouses all his powers to superhuman deeds. As the context shows, the word *Schaudern* does not mean the feeling of being overawed; it is used in opposition to *Erstarren*, to "being overawed and petrified with fear." It means the thrill of awe at the recognition of danger and at the same time the courage to plunge into it.

The other passages to which Prof. Thomas refers in his letter,

\* To me but grandeur mute in mountain-peaks doth lie;

I ask not whence nor seek the reason why.

† To me, indeed, thou art as thou art, a great and wonderful mystery; yet I would nevertheless know something of thy history. I'm goaded to unfold thy genesis.

‡ Wonder and admiration alone lead into the sanctuary of art.

corroborate this interpretation of the word *Schaudern* as here used by Goethe.

In fine we may relate as certain that Goethe's line: *Das Schaudern ist der Menschheit bestes Theil* means about the contrary in every respect to the sense in which it was quoted. It does not mean reverence for the past but the excitement of the "to do and dare" at the approach of danger. It does not describe a state of being overpowered with feeling, but of controlling one's feeling and making ready for action, no worship of antique tradition, no wonder at and admiration of, no bowing to authority, but the courageous mastery of the unwonted, the perilous and the apparently impossible.

## THE RELIGION OF THE FRIEND.

To the Editor of THE OPEN COURT:

The religion of the Friend is so greatly differentiated from Religion as generally understood, that Isaac Pennington, a distinguished Friend, two hundred years ago declared: "Our religion stands in the opposite of yours." And I thought I would explain a little to the readers of THE OPEN COURT of what are called "Friends principles."

In the first place when we meet together for worship, we meet in silence—that the phenomenal man may be still and silent before the Eternal; thus we recognize the Socratic as well as the Pauline doctrine: "That the things of man know no man but by the Spirit of man that is in him; and so the things of God know no man but by the spirit of God." Recognizing herein also with Spencer the difference between what he calls "the religious consciousness and the common consciousness." The common (phenomenal) affairs of life we seek to lay aside for the time being, knowing that spiritual things are correlate with spiritual things, and that we can worship God in spirit and truth only as we receive ability directly and immediately from Him so to do. And likewise also in the Ministry, we hold that that which gathers to God proceeds alone from Him! The Ministry with us is *free*—"without money and without price," and without distinction of sex—"neither male or female in Christ!" The Bible, we view as a history of man's conception of his Creator; and not as a history of His dealings with His creature man! The truths of the Scriptures, "either on Christian, or on Heathen ground," we estimate highly, holding with Paul that "all Scriptures given by the inspiration of God are profitable, that the man of God may be thoroughly furnished unto good works." And William Penn herein was the first of his time to quote from distinguished Heathen writers as correlate with Christian thought.

We hold to the universality of Divine Illumination, and that "Christ is the head of every man and first born of every creature." And we distinguish, as Isaac Pennington also did, between the "outward garment" (the man Jesus) and the heavenly anointing; holding with the apostle John: "Ye have all received an anointing (Christ), and need not that any man teach you, but as this self-same anointing teach you which is truth and no lie."

We do not put the man Jesus upon the pedestal of some overthrown heathen-divinity, but esteem him, as did the Apostles likewise, as "our Elder Brother." And this was a very common mode of expression concerning him amongst our early Friends; as he himself said, as we read, "Whoso doeth the will of God the same is my brother, my sister, and my mother."

We bear an open testimony against all intemperance; neither excess nor deficiency in anything; and Friends were amongst the first to testify against the evils of their time and day.

We can also believe in Monism as the highest phase and plane of human thought—*Oneness*—"That they may be one, even as we are one, I in Thee, Thou in me, that they may be one in us," as we read in the Similitude for the fourth gospel he holds as such, "the Spiritual Gospel," as our early friends termed it. We hold

that we can become one with God as Jesus was, being the same in substance, or inner "likeness," we can assimilate with Him—be one in harmony and purpose and thus experience the at-one-ment!

This is in a few words the faith of the Friend, and it does not take many words to tell of "the one thing needful." And herein I would inquire of the readers of *THE OPEN COURT* whether there is any reason why they cannot unite with us in our esoteric association. Huxley has said that "the Religion of the future is to be of the silent sort." Pythagoras taught the same truth 3000 years ago, and it remains the same "one thing" in substance to-day.

DAVID NEWPORT.

ABINGTON, Pa.

## BOOK REVIEWS.

DEGENERESCENCE ET CRIMINALITE. Essai Physiologique. Par Ch. Féré. Paris: 1888. Félix Alcan.

LA CRIMINOLOGIE. Etude sur La Nature du Crime et La Théorie de la Pénalité. Par R. Garofalo. Paris: 1888. Félix Alcan.

The results of modern scientific research have long since demonstrated the flagrant inconsistency which exists between the inherited notions of penalty and the obvious interests of society. The theories of penal justice hitherto accepted have emanated from a false conception of the true relation between criminal and State, and from the days of Ramses II. to the Prison Reports and revisions of Criminal Codes in the States of the Union, the history of criminal jurisprudence has ever been marked by this patent antagonism between the principles of juridical logic and the welfare of political communities. It accorded perfectly with the theocracy of Egypt to substitute the notion of a punitive divinity for the idea of a sovereign punitive power in the State. Yet this false notion of divine justice has inherited in and perverted every criminal code and every known expression of penal legislation. The pacification of a Deity has ever been the criterion accepted in imposing a sanction upon criminal trespasses against society. In other departments the jurat consciousness of antiquity found accurate and consistent expression, but their theories of penalty were marked by crudity and pervaded by a perverted sentiment. The principles of civil and administrative law had attained in imperial Rome a comprehensiveness and a logical consistency never since surpassed, but the most enthusiastic of juriconsults would never claim for the criminal jurisprudence of the great empire a title of the perfection reached in the kindred departments of legal science. These principles became the heritage of the Middle Ages; and far from noting an advance, we mark a relative retrogression in the theoretical analysis and practical application of penal notions—due allowance being made for the defects of political structure and the immaturity of mediæval society. The Middle Ages were essentially theocratical, and in the administration of criminal justice theocracy has invariably been characterized by excessive atrocity. To those people the fear of the Lord had become the beginning of wisdom in all its practical significance, and they did not hesitate to make infinite sacrifices to a deity who united in himself so many attributes of infinitude. Even later, when the transition from ecclesiastical to secular methods was being effected in the domain of politics, when the theoretical discussion of administrative problems came to be based upon the admitted premises of general utility, the principles of criminal justice were still made to conform to the postulate of powers delegated from a retributive God. The punitive function of the State appeared to have been restricted to the pacification of a mystical divinity rather than limited to the protection of society and dominated by the test of general utility.

This false conception of a fore-ordination of punishment, with

its consequent unreasonable and disproportionate imposition of penal sanctions created in the eighteenth century in parts of Europe a revulsion of public interest in favor of the criminal. But the sympathy thus manifested was directed more towards the victims of justice than towards the victims of crime. The tendency bid fair to abolish punishment rather than lead to the abolition of atrocious sanctions and the reformation of the sociological conditions which produced crime. Sentiment and pity have, in their turn, given place to the researches of Science which seeks to elucidate the true nature of crime, and thereby to accord it its true position as an object of justice. Anthropology and psychology regard the criminal as an anomaly or type of the *genus homo*. In England Maudsley, in France Despine, in Italy Lombroso, have principally studied to perfect this scientific tendency of criminology. And now: are the prevailing theories of criminal legislation, are the theories of penalty now dominant in juridical science to conform to the verified results of scientific research? This is the question which we find discussed in the two books before us.

M. Ch. Féré, attending physician at the Bicêtre, an asylum and house of correction near Paris, has enjoyed especial advantages for the study of criminal physiology and he has incorporated the results of his experience and the ideas suggested by his observations in a little book of 178 pages entitled: "Degeneracy and Criminality, a Physiological Essay." It is prefaced by a chapter upon "The Physiological Conditions of the Emotions," which appeared in the *Revue Philosophique* of December, 1887, and which serves as a fitting basis for the discussions following. The chapters upon "Criminal Heredity" and "The Anatomical and Physiological Character of Criminals" are of prominent interest. The style is clear and the treatment is marked throughout by that lucidity of method which has so much enhanced the worth of French contributions to Modern Psychology.

The larger work upon Criminology by R. Garofalo, Fellow of the University of Naples and Deputy Attorney General for the same district, is a French translation of a more exhaustive treatment of the subject, written from the standpoint of the jurist and law-maker. Mr. Garofalo's literary activity in this field of inquiry, including many critical essays upon the same subject and a larger treatise entitled *Criterio positivo della penali*, has in part supplemented the work of Lombroso and Ferri, and aroused in Italy the attention of all publicists, whether in favorable or adverse criticism, upon this important subject. The book is encyclopædic in character, and forms a comprehensive introduction to the study of criminology in all its aspects.

The beautiful month of June is fitly ushered in by the *Art Amateur* with a gorgeous bunch of roses. They are strong in color and forcibly drawn, but yet we miss in them everything which makes the rose the dearest of all flowers, the ever fitting expression of love and beauty. It is a mistake to paint the stiff products of the gardener's art as conventional and formal as the work of the professional designer, instead of the natural flower in its freedom and grace. We like better the puppies lightly sketched by Miss Elizabeth Strong, from her painting in the Paris *Salon*. A very full account is given of this *salon* exhibition, which is said to be a good average one. The list of artists contain many well known names, which it is pleasant to meet again, and some new ones, whose success will be welcome to many friends. The different estimates of Mr. Sargent's work by two of the critics in this number offer us food for thought, and may encourage timid amateurs to express the judgment of their own eyes in regard even to fashionable pictures, for they will be sure to find some to agree with them whatever view of an artist they may take. We should certainly venture a very decided opinion of the black scratches called a "Street in Venice," by this painter. "California Art Gossip"

is the heading of one article. It is a pleasant sign of progress that there is art enough there to gossip about. There appears to be a good school of design in San Francisco, one of whose pupils, Mr. Wins, was wise enough to study the peculiar Chinese life about him, which secured him so good a sale of one of his pictures that he was enabled to study in Europe, and then go to Japan. He is now exhibiting pictures of Japanese subjects. An article on Landscape painting is well illustrated by pleasing sketches. Among the Answers to Correspondents we find this bit of sound advice: "On the whole, we advise you to study in America until, at least, you are thoroughly grounded in drawing, before entering the foreign schools, where, as a recent writer says, 'talent is only mediocrity.' What chance there, then, has ignorance?"

We are glad to see some reproductions of Flaxman's designs. Purity and beauty of line so forgotten in these impressionable days that it is refreshing to see these outlines of the "Birth of Aphrodite" and "Oceanus and the Nereids."

There are also good articles on Decoration and Fancy Work, with suitable illustrations.

#### NOTES.

Carus Sterne has told us, in his essay ending with the last number of *THE OPEN COURT*, what a wonderful mechanism the animal soul is, and how intimate are its relations to the human soul. Gustav Freytag introduces the same subject in the *Lost Manuscript*, which is published in this number. Prof. Raschke says: "The same vital power which we observe in ourselves is fundamentally at work with them, only limited by a less complicated, and, on the whole, less complete organization." And "the egg, too, has its story." The egg contains in its protoplasm certain forms in which are stored the memories of animal life acquired by the many millions of its feathered ancestors. As to the difference of the animal soul and the human soul, we refer our readers to the editorial of No. 33, *Monism and Philology*, in which the problem of the Origin of Reason is discussed. The origin of reason, Max Müller says, must be looked for in language, "Man thinks because he speaks." The human soul has the power of abstract thought, because man gives utterance to his sentiments in words. The word is the origin of spirit life, with all its wonderful achievements.

*THE OPEN COURT* is much more radical than Agnosticism. Onesided radicalism may appear injurious to, but consistent radicalism will not be destructive of, religion; it will purify it, it will benefit it—indeed, the spirit of radicalism, that of a fearless love of truth, is truly, religious.

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XVII.—Continued.

One evening, Professor Raschke having looked in late, showed himself disposed to pass the evening with them, and Felix sent the servant to the Professor's wife, to set her mind at rest as to the absence of her husband. As Raschke, among all her husband's colleagues, was Ilse's favorite, she took pains to order something that would please him. This order doomed to death some chickens that shortly before had been brought in alive. The gentlemen were sitting in Ilse's room when a dreadful scream and clamor issued from the kitchen, and the cook, pale as death, opened the door and appealed to her mistress. It appeared that the girl's heart failed her in attempting to kill the fowls,

and as Gabriel, who had hitherto performed all such necessary slaughter, was absent, she did not know what to do, so Ilse herself had to perform the indispensable act. When she returned, Felix unfortunately asked why she had left the room, and Ilse told him what had occurred.

The chickens were placed upon table and did the cook no discredit. Ilse carved and served them, but her husband pushed back his plate, whilst Raschke, out of politeness, picked at the breast, but forbore to eat a morsel. Ilse regarded the two gentlemen with astonishment.

"You do not eat anything, Professor?" she at last said to her guest, anxiously.

"It is only a morbid weakness," replied Raschke, "and it's very foolish indeed, but the screams of the poor bird still linger in my ear."

"And in yours, too, Felix?" asked Ilse, with increasing wonderment.

"Yes," rejoined he. "Is it not possible to have these things done quietly?"

"Not always," answered Ilse, mortified, "when the house is so small, and the kitchen so near." She rang and ordered the ill-fated dish to be taken away. "Those who can't bear things to be killed should eat no meat."

"You are quite right," replied Raschke, submissively, "and our sensitiveness has but little justification. We find the preparations unpleasant, yet as a rule we are well satisfied with the result. But when one is accustomed to observe animal life with sympathy, he is necessarily shocked at the sudden termination of an organism for his own selfish purposes, when it is done in a way to which he is not accustomed. For the whole life of an animal is full of mystery to us. The same vital power which we observe in ourselves, is fundamentally at work with them, only limited by a less complicated, and, on the whole, less complete organization."

"How can you compare their souls with that of man's?" asked Ilse; "the irrational with the rational; the transitory with the eternal?"

"As to irrational, my dear lady, it is a word to which in this case one does not attach a very clear meaning. What the difference may be between man and beast is difficult to decide, and on this subject a little modesty becomes us. We know but little of animals, even of those who pass their lives among us. And I confess that the attempt to fathom this unknown problem fills me with awe and reverence, which occasionally rises into fear. I cannot bear that any one who belongs to me should grow fond of an animal. This arises from a weakness of feeling which I own is sentimental. But the influence of the human mind on animals has always seemed to me wonderful and

\* Translation copyrighted.

weird; phases of their life are developed, which in certain directions make them very similar to man. Their affectionate devotion to us has something so touching in it, that we are disposed to bestow much more love on them than is good either for them or us."

"Still an animal remains what it was from the creation," said Ilse; "unchanged in its habits and inclinations. We can train a bird, and make a dog fetch and carry what he would rather eat, but that is only an outward compulsion. If let to themselves, their nature and manners remain unaltered, and what we call culture they lack utterly."

"Even upon that point we are by no means sure," rejoined Raschke. "We do not know but that each race of animals has a history and an evolution which extends from the earliest generation to the present. It is not at all impossible that acquirements and knowledge of the world, so far as they may exist in animals, have acted among them, though in a narrower sphere, just as with men. It is quite an assumption that birds sang just the same way a thousand years ago as they do now. I believe that the wolf and the lynx, in cultivated regions, stand on the same footing in the struggle for life as do the remnants of the red Indians among the whites; whilst those animals that live in comparative peace with man, like sparrows and other small creatures, and bees especially, improve in their mode of work, and in the course of time make progress—progress which we in some cases surmise, but which our science has not yet been able to describe."

"Our forester would quite agree with you in this," said Ilse, quietly; "as he complains bitterly that the bullfinches of our neighborhood have, within his memory, quite deteriorated in their singing, because all the good singers have been caught, and the young birds have no one to teach them."

"Exactly," said Raschke; "among animals of every species there are clever and stupid individuals, and it must follow that to some of them is assigned a definite spiritual mission which extends far beyond their own life. And the experience of an old raven, or the enchanting notes of a melodious nightingale, are not lost on the future generations of their race, but influence them continuously. In this sense we may well speak of culture and continued improvement among animals. But as regards the cooking, I admit that we exhibited our sympathies at the wrong time and place, and I hope you are not angry with us, dear friend."

"It shall all be forgotten now," replied Ilse, "I will give you boiled eggs the next time; they will involve no scruples."

"The egg, too, has its story," answered Raschke;

"but for the present, I may fitly waive discussing this. What has brought me here," addressing Felix, earnestly, "was neither fowls nor eggs, but our colleague, Struvelius. I am seeking forgiveness for him."

Felix drew himself up stiffly. "Has he commissioned you to come?"

"Not exactly; but it is the wish of some of our colleagues. You know that next year we require an energetic Rector. Some of our acquaintance are speaking of you. Struvelius will probably be Deacon, and for this reason we wish to bring you into friendly relations; and still more for the sake of peace at the University. We regret exceedingly to see our classicists at variance."

"What the man has done to me," replied the Professor, proudly, "I can easily forgive, although his mean and underhand conduct has deeply offended me. I feel much more seriously the effect of his foolish work upon himself and our University. What separates me from him is the dishonesty of spirit that has actuated his conduct."

"The expression is too strong," cried Raschke.

"It applies to his behavior exactly," returned the Professor. "When the forgery was pointed out to him, his fear of humiliation was greater than his love of truth, and he lied in order to deceive others—conduct unworthy of a German professor, and I can never forgive it."

"Again you are too severe," replied Raschke; "he has frankly and loyally admitted his error."

"He did so only when Magister Knips and others clearly proved the forgery that had been committed in the manuscript, and so made any further evasion impossible."

"Human feelings are not so easy to analyze as numbers are," rejoined Raschke; "and only he who judges charitably, judges rightly. He struggled with wounded pride perhaps too long, but he gave in at last."

"I tolerate no unknown quantity in the sense of honor of a scientist; the question here was: Black or white? Truth or falsehood?"

"You have, nevertheless," said Ilse, "shown the Magister much greater leniency, and I have seen him with you since, more than once."

"The Magister was less to blame in the matter," her husband replied. "When the question was clearly before him, he employed his acuteness to some purpose."

"He took money for it," said Ilse.

"He is a poor devil, accustomed, as a broker, to take his profits on any exchange of antiquities, and no one would expect in such a transaction that he should act like a gentleman. So far as his oppressed

spirit belongs to science, it is not without a sort of manly pride; and I have the warmest sympathy for a nature of that kind. His life on the whole is a continual martyrdom to the interests of others; and when I employ such a man, I know exactly how far to trust him."

"Do not deceive yourself in that!" cried Raschke.

"I shall take the risk and the responsibility," replied the Professor. "But have done with the Magister—it is not he who is in question. When I compare his offense with that of Struvelius, there is no doubt in my mind as to who has shown the greater deficiency in sense of honor."

"This again is so unjust," cried Raschke, "that I cannot listen to such expressions in the absence of my colleague. It is with deep regret that I miss in you the candor and dispassionate impartiality which I consider to be unreservedly demanded in judging a fellow-professor."

"You yourself told me," replied Felix, more quietly, "that he promised silence to the trader, because the latter had held out the prospect of obtaining other secret parchments. How can you, after such an exhibition of selfishness, find a word to say in his defense?"

"It is true he did so," replied, Raschke, "and therein was his weakness?"

"Therein was his dishonesty," said the Professor, "and that I shall never condone. Whoever thinks otherwise, may shake his hand in approbation of his conduct."

Raschke rose. "If your words mean that he who grasps the hand of Struvelius in pardon for what he has done, has lost in character and self-respect, I reply to you that I am the man, and that this act of mine has never lessened my sense of dignity nor humiliated me in my own eyes. I entertain the highest respect for your pure and manly feelings, which I have ever deemed exemplary; but I must now tell you, that I am not satisfied with you. If this obduracy has come upon you merely because Struvelius has personally offended you, you are violating the standard which we are ever in duty bound to observe in judging our fellow men."

"Let it not be observed then!" exclaimed the Professor. "I recognize no standard of leniency when I have to do with the demands which I make upon the sense of honor and propriety in my personal acquaintances. It affects me deeply that you are opposed to me in this way of thinking; but such as I am, an erring and imperfect mortal, I cannot moderate these claims upon those about me."

"Let me hope then," broke in Raschke, "that it will never be your misfortune to have to confess to others that you have been deceived by an impostor in the very matter wherein your consciousness of self-

reliance has been so strongly aroused. For he who judges others so proudly, would suffer no small affliction in the confession of his own shortsightedness."

"Yes, that would be fearful for me," said Felix, to involve others in error and falsehood against my will. But trust me, to atone for such a wrong I would use all my life and strength. Meanwhile, between that man and me the gulf will remain as dark as ever."

Raschke shoved back his chair. "I must go, then; for our discussion has so excited me that I should make a very unentertaining companion. It is the first time, my dear lady, that I have ever left this house with any feeling of unpleasantness; and it is not my least annoyance, that my untimely advocacy of the existence of souls in poultry made me bristle up my crest against you also."

Ilse regarded the excited countenance of the worthy man with pain, and, in order to soothe him and restore the old friendly relations, she said to him, coaxingly: "But you shall not escape the poor chicken, you'll have to eat it, and I shall take care that your wife gives it to you to-morrow morning for breakfast."

Raschke pressed her hand, and rushed out through the door. The Professor walked up and down the room in agitation, and then stopping before his wife said, abruptly, "Was I in the wrong?"

"I don't know," replied Ilse, hesitating; "but when our friend spoke to you, all my feelings went with him, and I felt that he was right."

"You, too!" said the Professor, moodily. He turned on his heel and went into his study.

Ilse once more sat alone with a heavy heart, and she murmured, "In many things he looks on life very differently from what I do. Towards animals he is kinder, and towards men sometimes harsher than I am. Strive as I may, I shall always be to him an awkward country lass. He was kind to Madam Rollmaus, and will be so towards me; but he will ever have to make allowances for me."

She sprung from her chair with a burning face.

In the meantime Raschke was roving about in the anteroom; there too disorder prevailed. Gabriel had not returned from his distant errand, and the cook had put all the dinner things upon a side-table till his return, and Raschke had to look for his own great-coat. He groped among the clothes and seized a coat and a hat. As to-day he was not as absent-minded as usual, a glance at the rejected meal reminded him of the fact that he had to eat a chicken, as enjoined by Ilse. He, therefore, seized a newspaper which Gabriel had carefully laid out for his master, took the chicken from the dish, wrapped it up in the paper, and deposited it in his pocket, the depth and capacity of which agreeably surprised him. Rushing past the

astonished cook he left the house. On opening the front door he stumbled over something on the threshold, and heard a fearful growl behind him as he hurried down the steps into the open air.

The words of the friend whose house he had just left, still rung in his ear. Werner's whole bearing had been very characteristic, and his nature was a strong one. Strange, that in a moment of anger his face had suddenly assumed a likeness to that of a Danish dog. Here the philosopher's chain of ideas was broken by the sudden recollection of the talk about animal souls.

"It is indeed to be deplored that it is still so difficult to determine the significance of expression as revealing the animal soul. If success attended our efforts here, science too would gain by it. If the expressions and gestures exhibited in moments of passion by man and the higher animals could be compared and collated in every detail, important and interesting inferences might be drawn, both from that which they manifested in common and from that wherein they differed. For, in this way, the true nature and purport of their dramatic actions, and probably new laws governing the same, might be ascertained."

Whilst the philosopher was thus meditating, he felt a repeated tugging at the end of his overcoat. As his wife was accustomed, when he was wrapt in thought, to nudge him gently if he met a friend, he paid no attention, but took off his hat politely to the post on the bridge, and said, "Good evening."

"The common character and origin of mimical expression in man and the higher animals might, perhaps, if fully known, give us glimpses into the great secret of life." Again something pulled him. Raschke mechanically lifted his hat. Another tug. "No more, dear Aurelia, I have taken my hat off." It then occurred to him that it could not be his wife who was pulling so low down at his coat. It must be his little daughter Bertha, who occasionally walked with him, and, just like her mother, would also nudge him gently when he had to bow to any one. "Very well, dear child," said he, as Bertha kept continually pulling at his hind coat pocket, and he put his hand behind him to catch the little teaser. He caught hold of something round and shaggy, and at once felt the sharp edges of teeth in his fingers, which made him turn round with a start. He then saw, by the lamplight, a red, brindled monster, with a great head and bristly hair, and a tuft instead of a tail. It was an awful transformation of wife and daughter, and he stared with amazement at this mysterious being, that stood opposite to him, likewise regarding him in silence.

"A remarkable meeting," cried Raschke. "What art thou, unknown beast—presumably a dog?" Get

away with thee!" The animal slunk back a few paces, and Raschke pursued his inquiry further. "If the facial expression and the gesticulation attendant upon emotion could be thus referred and traced back to original and common forms, the instinctive tendency to appropriate and to adapt what is foreign would undoubtedly result as one of the most universal and effective of laws. It would be instructive from the involuntary actions of men and animals to ascertain that which naturally belonged to each species and that which each had acquired. Get away, dog;—home with you, I say! What is he after, anyway? He is apparently one of Werner's people. The poor brute is possessed of some overpowering idea and will lose his way running about the city!"

In the meantime, Spitehahn's attacks had become more violent, and he at last dropped into a ludicrous march upon his hind legs, while, placing his forefeet on the Professor's back, he buried his nose in the latter's coat-pocket.

Raschke's interest in the thoughts of the dog increased. He stopped by a lamp-post and carefully examined his overcoat. He found that it possessed a cape and long sleeves, which the philosopher had never observed before on his own coat. The matter was now clear: he had thoughtlessly taken the wrong coat, and the honest dog meant to preserve his master's wardrobe, and to make the thief restore it. Raschke was so pleased with the dog's cleverness, that he turned round and spoke coaxingly to Spitehahn, trying to stroke his bristly coat. The dog snapped at his hand. "You are quite right," said Raschke, "in being angry with me. I will show you that I confess I am in the wrong." So he took the coat off, and hung it over his arm. "It is, indeed, much heavier than my own." He marched briskly on in his light coat, and saw with satisfaction that the dog made no more attacks on his skirts. On the other hand, Spitehahn seized the great-coat, and began biting at it, snapping at the Professor's hand and growling furiously.

The Professor got angry with the dog, and as he came to a bench in the Promenade, he laid the coat down on it, in order to deal with the animal in earnest, and drive him home. By this means he got rid of the dog and, what was more, of the coat too; for Spitehahn, jumping up eagerly on the bench with a mighty leap, seized the coat, and kept the Professor at bay. "It is Werner's coat," said the Professor, "and it is Werner's dog, and it would be unjustifiable to beat the poor animal because in his fidelity he has become excited, and it would be also wrong to leave both dog and coat." So he remained with the dog, trying to coax him; the animal, however, took no further notice of the Professor; on the contrary, he devoted himself to the coat, which he

turned over and over again, scraping and gnawing at it. Raschke perceived that the coat would not long stand such treatment. "The dog must be mad," he said to himself, suspiciously, "and I shall have to resort to violence after all towards the poor creature;" and he considered whether it were better to jump up on the bench and drive the mad dog off with a good kick, or to make the unavoidable attack from below. He decided on the latter, and searched about for a stone or stick to arm himself for the encounter. He then looked up at the trees and the dark sky, and could not in the least tell where he was. "Is this witchcraft?" he said to himself, amused. "Pray tell me," addressing a solitary passer-by, "in what part of the town we are; and will you have the goodness to lend me your stick for a moment?"

"These are strange questions," replied the stranger, in a surly tone. "I want my stick myself at this time of night. And who are you, sir, I should like to know?" And he approached the Professor menacingly.

"I am a peaceable man," replied the Professor, "and little inclined to violent courses. But a struggle has commenced between that dog on the bench and me about an overcoat, and I should be extremely obliged to you if you would rescue the coat from the dog. But pray do no more harm to him than is absolutely necessary."

"Is it your coat?" asked the man.

"Unfortunately, I cannot say it is," replied Raschke, conscientiously.

"There is something wrong here," cried the stranger, again looking with suspicion at the Professor.

"Something, indeed," replied Raschke; "the dog is mad, the coat has been changed, and I don't know where we are."

"Close to the Valley Gate, Professor Raschke," answered the voice of Gabriel, who rapidly joined the group. "But, pardon me, how came you here?"

"How opportune," cried Raschke, delighted; "just take charge of the coat and the dog."

With astonishment Gabriel saw his friend Spitehahn, who was now sitting on the coat, quite abashed and chapfallen at the sight of his master. Gabriel drove the dog off, and seized the coat. "It is my own overcoat!" he said.

"Yes, Gabriel," rejoined the Professor, "that was my mistake, and the dog has displayed a wonderful fidelity in guarding it."

"Fidelity!" said Gabriel, indignantly, as he pulled a parcel out of the pocket; "it was greedy selfishness. There must be something to eat in here."

"Ah! I recollect now," cried Raschke; "it is the fowl that's to blame. Give me the parcel, Gabriel; I must eat it myself. And we may now wish one

another good-night in peace, unless you will go with me a little way to show me the road amongst these trees."

"But you can't go in this night air without an overcoat," said the tender-hearted Gabriel. "We are not far from our house, and it would be better for you to return with me to the Professor's."

Raschke paused a while, and laughed. "You are quite right, my good Gabriel: my sudden departure was all wrong, and the soul of an animal has this day given a lesson to a human soul."

"If you mean this dog," replied Gabriel, "it is the first time in his life he has given anybody a lesson. I suppose that he followed you from our door, for I put bones there for him every evening."

"At one time I thought he was quite mad," said the Professor.

"He is a sly one when he chooses," replied Gabriel, with an air of mystery; "but if I were to tell all my experiences with him to this day——"

"Do tell me, Gabriel," cried the Professor, quite excited. "Nothing is so valuable with respect to animals as authentic anecdotes, collected by those who have observed them closely."

"I can vouch for my experience," said Gabriel, with an air of confidence; "and if you really wish to know what he is, I can tell you he is possessed—he is a devil—he's a depraved brute—and bears a grudge against the whole human race!"

"Hum!—is that so?" murmured the philosopher. "I believe it is much easier to look into the heart of a Professor than that of a dog."

Spitehahn crept along quietly but depressed, with his tail between his legs, listening to the praise bestowed on him, whilst Raschke, accompanied by Gabriel, returned through the park to the house. Gabriel flung open the parlor door, and announced "Professor Raschke."

Ilse stretched out both hands, "Welcome—welcome, dear Professor!" and led him in to her husband's study.

"Here I am again," said Raschke, in a cheerful tone, "after an adventure like a fairy tale. I have been brought back by two animals who have shown me the right path—a roast fowl and a perverted dog."

Felix sprang to his feet, the two friends shook hands cordially, and, after all misunderstanding, the evening passed off most pleasantly.

When Raschke at length withdrew, Gabriel said sorrowfully to his mistress: "It was the new coat; the chicken and the dog have ruined it beyond all recognition."

(To be continued.)

## WEBSTER'S UNABRIDGED

In various Styles of Binding.

Besides many other valuable tables, the latest issue of this work contains

## A Dictionary

118,000 Words, 3000 Engravings,

## A Gazetteer of the World

of 25,000 Titles, (recently added) and

## A Biographical Dictionary

of nearly 10,000 Noted Persons,

## All in One Book.

Webster is Standard Authority in the Gov't Printing Office, and with the U. S. Supreme Court, and is recommended by State Sup'ts in 36 States.  
Published by G. & C. MERRIAM & CO., Springfield, Mass.

## A Library in ITSELF.

The Latest Edition has 3000 more Words, in its vocabulary, than are found in any other American Dictionary, and nearly three times the number of Engravings.

In quantity of matter, it would make 75 12mo volumes usually sold for \$1.25 each.

It is an ever-present and reliable school-master to the whole family.—S. S. Herald.

## PAMPHLETS ON LIVING QUESTIONS.

Truths for the Times. By Francis Ellingwood Abbot. "The great inspiration of the nineteenth century is faith in the ideal unities as possible in fact." Price, 10 cents; 10 copies, 30 cents; 100 copies, \$1.00.

Fear of the Living God. By O. B. Frothingham. Price, 5 cents.

Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents; 10 copies, 30 cents.

Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 30 cents.

God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 30 cents.

Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.

The Present Heaven. By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.

The God of Science. By Francis Ellingwood Abbot. Price, 10 cents.

On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.

A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 30 cents.

The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 30 cents; 100 copies, \$3.00.

The Bible and Science. By John Weiss. Price, 10 cents.

The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.

Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.

The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.

A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

CHARLES H. KERR &amp; CO., Publishers.

175 Dearborn Street, Chicago.

## Contents of Recent Numbers.

BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.

FELIX L. OSWALD, M. D. In Nos. 27, 29, 31, 33, 34, 35, 36, 40 and 42.

The Science of the thousand-fold moral effects of physical causes is still a sealed book to a large plurality of our fellowmen. The ethics we have inherited is biased by the tenets of an anti-physical and anti-natural philosophy, and the tendency of the latter has ever been to sanction and exaggerate

the physical effects of moral causes. Dr. Oswald says: "Our entire system of moral education needs a thorough revision, and the success of urgent social and ethical reforms depends on the radical reconstruction of moral philosophy on a basis of natural science." The subject is treated in the graphic manner which has ever characterized Dr. Oswald's contributions to the Literature of Natural History and Anthropology. It is marked by the usual wealth of illustration and abounds in felicitous and pertinent citations of historical and natural evidence.

## THE FUNDAMENTAL PROPERTIES OF MATTER.

J. G. VOGT.....In Nos. 29, 31 and 34.

To the Kinetic conception of the world's mechanism Vogt opposes his hypothesis of a continuous world-substance completely filling space and whose sole manifestation of power consists in contraction or condensation. He claims that the kinetic or mechanical theory which explains organized and spiritual phenomena from foetic atoms and a purposeless force, is untenable; and that pseudo-morphism which transforms the most complex conditions and processes of psychical life into the elementary substance itself. Involves the fallacy of Idealism and dualism. As opposed to both views Vogt propounds his conception which he calls Monism of Reality. He attributes to matter two fundamental properties, motion and sensibility, and deduces from these elementary properties the higher phenomena of intellectual life.

## FREE-WILL A MECHANICAL POSSIBILITY.

XENOS CLARK.....In No. 39.

Mr. Xenos Clark here presents in an interesting and attractive manner certain scientific analogies bearing upon Free-Will and Determinism. A novel and ingenious application is made here of the theory of linkages and link-work which of late has so interested mathematicians and been developed with such striking success by Prof. Sylvester. The article will be found to be unusually suggestive, although it is not in concord with T. H. O'Connor, which, in an editorial of No. 33, admits the truth of both Free-Will and Determinism.

## ECONOMIC CONFERENCES.

WHEELBARROW.....In Nos. 37 and 40.

The Economic Conferences of Chicago may be hailed as a significant indication of a breach in the barrier between Labor and Capital. The conferences have served as a medium for the open exchange of opinion, where both sides are fairly represented. Wheelbarrow's criticisms are acute and pithy, and merit a careful perusal. The author unites Old Saxon Simplicity, sincerity of heart, the truthfulness of honesty and warm sympathy for justice and right.

## THE ANIMAL SOUL AND THE HUMAN SOUL.

CARUS STERNE.....In Nos. 37, 41 and 43.

An essay full of fine thought and psychological depth. Carus Sterne well understands to follow a subject as historically developed in the realm of human opinion and as ultimately affected by the light of Modern Science. The question of the relation of the animal to the human soul has ever been of interest and in this essay we find it attractively yet accurately treated.

## PLANTATION FOLK-LORE.

L. J. VANCE.....In No. 41.

Mr. Vance reviews and discusses the movement and widespread interest in popular tales which has produced the recent collections of Negro Myths by Joel Chandler Harris ("Uncle Remus") and Mr. Charles C. Jones. These tales form an important addition to the Folk-Lore of the New World, and Mr. Vance's review will be welcomed by all who wish to acquire a comprehensive estimate of the significance of these Myths to comparative literature and the science of comparative ethnology.

In an intelligent review of Max Müller's Introductory Lectures on the "Science of Thought," published by THE OPEN COURT PUBLISHING CO., Mr. Ernst says in the Boston *Review*:

"Max Müller's supremely simple theory is hotly disputed, \*\* but it is easily vindicated, provided one is not a dualist on principle. \*\* Max Müller explains with a master's clearness and firmness what has barely been hinted at in these columns. Now, as a matter of fact, half the trouble in life, half the lawsuits in our courts, and most of the quarrels in society arise from the petty fact that men and women, the college graduates not excluded, are not sufficiently acquainted with their own language. They think they know what they say; but until one really knows what one says,—precisely as the banker uses figures in a cheque,—there will be trouble."

## The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
  2. The Identity of Language and Thought; and
  3. The Simplicity of Thought.
- With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

THE OPEN COURT PUBLISHING CO.

169-175 La Salle Street. Chicago.

Neatly Bound in Cloth. Price, 75 Cts.

The study of language is of interest to the lawyer as well as the clergyman, the scientist as well as the teacher, and no education is complete without it.

Max Müller says in this most instructive and interesting book:

"Try to reckon without numbers, whether spoken, written, or otherwise marked, and if you succeed in that, I shall admit that it is possible to reason or reckon without words, and that there is in us such a thing, or such a power or faculty, as reason apart from words. \* \* \*

"People do no longer believe in witches nor in ghosts. But the belief in disembodied thought will die very hard. \* \* \*

"As little as we possess a thing called hunger because we are hungry, do we possess a thing called reason because we are rational. Why, then, should we write it with a Capital R, and make a goddess of Reason and worship her, as she was actually worshipped in the streets of Paris? \* \* \*

## ETHICS AND PUBLIC LIFE.

BY W. M. SALTER.

It must be admitted that the public interest is sadly neglected at the present time. As a rule the best men do not enter public life. Politics is losing much of its nobler significance; it tends to become chiefly a strife for office. Our public servants appear often to be in office not so much to serve the public, as to serve themselves or some interest that put them there! It is scarcely exaggerating to say that the very conception of public life is becoming dim and uncertain. It is thought but natural that a representative in Congress or an Alderman in the City Council should do everything possible for the interests of his constituents, that this is his main reason for being there, that as many privileges or favors as he gets for his constituency, he is so much the better public officer. In other words, the idea is not that he should take a contribution and be himself a contribution to the councils of the nation or the municipality—giving his time, his thought and his energy to questions relating to the public good; but that he should go to Washington or the City Hall to get a contribution out of the storehouse of public funds and public powers, to meet the needs or gratify the caprices of a more or less narrow circle of individuals. More simply still, the idea is not that the people through the officers whom they choose shall help to support the government, but that the government through the various officers pulling and nagging at it shall help to support the people.

It is but a step further in this line when public officers come to view their chief obligations as being to those who helped elect them—to those who got the nomination for them, who managed their campaign and stood by them through thick and thin. When men owe their offices not so much to the spontaneous good will of the public, as to those who pulled the wires for their nomination and election, even the interests of the ward or the district may not have the first place in their affection, but rather the wishes and expectations and preferences of the Colonels and Captains, and Toms and Harrys, who worked the machine. Politics appears to be often a bargain, a trade—in which a candidate says, if you will do this for me, I will do that for you, and a man's henchmen or work-

ers feel that they have a right to their reward, in money or minor offices.

It is but a step lower down still, when a public officer's chief obligations come to be to some set of men, some corporation or interest that have really placed him in his seat. All these ways of regarding public office are of a piece. If a man's first obligations are to those who elect him, there is no hard and fast line between his ward or district, the workers of his machine or the interest that may be the soul of the machine. If the business of the legislator is to champion interests, why should it be incredible that in Congress most of the great railroad companies, the oil monopolies and the lumber companies should have their representatives? If so, is it surprising that our State legislatures—as is stated on excellent authority—should be the most corrupt political bodies in the world? Yes, if men in office are there to look after interests, why should they not look after their own interests, and why should boddlers in county-boards or in common councils surprise us? The danger lies in intruding interests into public affairs at all.

No one can quarrel with interests in their own place and under due restraint. It is right that an individual should look after his interests; but it is not right that the government should be made subservient to them; the government can only be made subservient to the interests of all. It might as well be plainly stated that to the extent we allow interests to control the government, we give an argument to the anarchist. The whole anarchistic position is this, that government is a tool which the rich and powerful make use of to make themselves securer in their power. It is cheaper, so the argument goes, to rule by laws than by personal prowess and to have the arm of the public defend you rather than to have to defend yourself; and the rich and powerful always rule. Now every step that individual or corporate interests take in lodging themselves in the government—I do not mean, of course, to the end of serving the public, but to the end of making the public serve them—every favor they win, every immunity, every privilege, every special legislation they secure, whether the form of a tariff or any other form, every man they send to a legislature and every man they influence there, every vote they buy and every juror they bribe, means not

only public injury and the demoralization of our politics, it means anarchy. There is nothing the man, to whom anarchy is a foregone conclusion, hails with more joy than just such unscrupulousness; it is but new proof for his position. By a strange irony the men who most hate anarchy, give to it its best arguments. Our country is probably not in danger of war; we have no external foe. Our danger is more insidious; it is not in wealth—no, the more wealth the better, the greater the possibilities of a high and noble civilization; it is in unscrupulous wealth, it is in wealth entrenching itself, buttressing itself behind government, it is in government by wealth,—that way madness, that way anarchy lies.

How shall we ward off that danger? How shall we save our country—a country dear to every soldier who fought for her, dear to us all who but think of her, a country to whom Lowell sings:

"What were our lives without thee?  
What all our lives to save thee?  
We reck not what we gave thee;  
We will not dare to doubt thee,  
But ask whatever else, and we will dare!"

We have to go down deep in this matter, we have to have nothing less than a new thought of the meaning of public life. No surface changes, no mending of our machinery will avail without this. Public life must mean to our minds, whatever it is now in reality, life devoted to public ends, dedicated to the public good. The true antithesis, the profoundly moral antithesis, is between living to one's own ends and living to the ends of the whole of which we are a part. Thank heaven, in every sphere of life one may be guided by public motives. But in private life, in private business we are not accustomed to expect it; the very idea of civic or political life, however, implies the larger reference.

He who marries, marries for love—or it is not a true marriage. He who becomes an artist devotes himself to the beautiful, or he is not a true artist. He who enters public life ceases to be dominated by private or partial interests, else he is not a true public servant. I do not deny, indeed, that an alderman should see that his own ward is not overlooked or slighted in schemes of general improvement, that it is his special duty to see to this as it is of other aldermen to see that their wards are not overlooked or slighted; but I do deny that it is any alderman's duty or right to seek for special privileges or advantages for his ward, I deny that he should seek for anything more than justice—and over and above and even in contradiction to local interests his care should be, to speak of our own case, for the good of the City of Chicago. So with any legislative district, with any commonwealth represented in the National Senate. In our State legislatures, it is the interests of the State

rather than those of a district, which its representative should serve. In the supreme legislative bodies of the land, it is the national interest that should dominate over all others. A true public life is a school of morality—for it takes one of oneself and links one to something larger. It makes no difference what the subject of legislative action may be—it may be streets and alleys, it may be garbage and sewage, or it may be schools, or courts of justice or a system of finance—all are to be looked at from an impersonal point of view, from the standpoint of the good of all.

A true public life may be the object of the purest as well as the loftiest ambition; it stands next to religion in dignity and honor—it is infinitely superior to all that religion which is but selfishness aiming at another world instead of this.

How can such a view of public life prevail? Only through public opinion. Let us try to send a fresh current of ideas through public opinion, let us disturb its stagnant waters and work to season and transform it,—only through a nobler thought of public life can our nation be regenerated.

In the next place, let us surround public office with more respect, let us give it more substantial honor. I do not mean that we shall not hold public servants to account, that we shall not unsparingly point out their short-comings, but only that our thought and speech should be tempered by a remembrance of the exalted station which they fill. It is surely enough to admit the facts in any case; but let us not exaggerate them, let us not take a ghoulish delight in parading them, let us speak in sorrow or in anger of them, but never lightly or in jest. A man will not coarsely upbraid his father, even though he were a drunkard or worse; the consciousness that he is his father acts as a curb upon his tongue. Plato says, we honor God when we honor the darkened and disfigured image of him; Geo. Eliot says, the mother's yearning feels the presence of the cherished child even in the base degraded man. Surely, we can in this spirit honor the dignity that for the moment attaches to the public servant, though we can not, the man himself—honor it enough to keep us from speaking contemptuously of him and to incline us, like the Sons of Noah in Hebrew legend, to cover his shame rather than to noise it abroad.

Matthew Arnold says that if there is a discipline in which Americans are wanting, it is the discipline of awe and respect. I am afraid he is more than half right. How familiar we are in speaking even of good men, men worthy of reverence! It is as if we were bound to have nothing which we had to acknowledge to be above us. How ready we are to suspect people, to throw out insinuations about them! I am afraid, in many cases, it is because it seems knowing and smart

Now there are public officers who are actuated by public aims, and perhaps there would be more if we had a better thought of them. There are men, in the National Senate, of Roman virtue, men who have never sought re-election, who have never gone into the ignoble traffic in offices, men who have broken with their party when the party went wrong. There are such men and they are a hint that all might be—and it is wiser and nobler to go on the supposition that they are such, until the contrary is plainly proved to us. And is it not a shame that a man should adorn one of the most dignified public offices in our land, and yet die able to leave scarcely any provision for his family? Even the Judges in New York City receive a half and two-thirds as much again as the Chief Justice of the United States. Do we honor an office when we provide so unworthily for the incumbent of it? And is this not true of public offices generally? Do we not hear time and again of those who have to retire to private life to earn enough to live upon with decency? I do not refer of course to those of whom we have a fair sample in a late Chicago alderman, who naively remarked that he was criticized when he went into the council for being too poor, and again, when he came out for being too rich—a most inconsistent criticism, he thought; I refer to those who regard public office as a public trust. Our present system of mean rewards to public servants tends to one of two things: either that rich men alone shall take public office, or that men who are too poor shall take it with the expectation of using their office for purposes of gain. I do not mean that public office should be as remunerative as private business; I only ask that it should not be a trial to good men to assume public office, that a manner of life commensurate with the dignity of the office be possible to them.

Thirdly, we should encourage the growth of ideas among those with political aspirations. There could hardly be a more effective way of preventing any expansion of thought among our public men than the present system of nominations and elections. We all believe that democratic institutions are the best, because they give men more freedom to rise and allow those with the best talents to take the lead in affairs. But there may be a tyranny of a majority as well as of an individual or a class, there may be oppressive restraint from a party as well as from prescriptive laws. It can hardly be denied that our parties, as at present inspired or rather uninspired, are breeders of mediocrity. They discourage all independence of views. They are without ideas themselves and have no hungering after them. As has been said time and again, the chief hunger is after offices. Read all the political news and discussions in our newspapers for the last few weeks—and there is scarcely the glimmering of

an idea in it all, unless it be one-quarter of an idea about the tariff; it is all about offices and about men—the Democrats, if I may be pardoned such familiar speech, are hardly so anxious about tariff-reform as they are to keep in office, and the Republicans are hardly so anxious about protecting American labor, as they are to acquire office. We want ideas in public life, we ought to have freer ways for getting men who represent ideas into office. Now, a man can hardly be elected, even to a place in a city council, unless he is endorsed by one or the other party-machine. It may be he is far better in character as well as ideas than the machine; we ought to be able to elect him without it. If there is one thing more absurd, more silly than another, it is to elect a man, either because he is a Democrat or a Republican, to a municipal office; yet the machine has as much life in local politics as in national politics, where alone it ever had a reason for being, and sometimes the rival machines give us nominations each worse than the other. When will Republicans and Democrats dare to claim their souls as their own? Not until they do so, shall we have a pure and honest and capable municipal service. The combined efforts of both machines have only served to give us in Chicago a worse council this year than we had last—a council, the majority of whom have refused to remove the dangerous influences of the saloon from the neighborhood of our public schools. Men of character and convictions, how can we get them into the legislative chambers of City, State and Nation? In the main, no doubt, only as there arises a freer public sentiment. But three things might be done to help along. The first is, to limit the amount by law which a candidate can pay for his campaign expenses. The party-machine is on the look-out for candidates who will pay well. This goes a long way towards deciding the availability of candidates. It is a shame that candidates should be expected to pay at all. If the amount were at least strictly limited, the machine would lose one reason for bringing forward incompetent men. Secondly, the expense of printing and distributing ballots on election day might be made a public expense; and any one who was asked by a certain number of citizens to stand as a candidate might have as good right to have ballots printed and distributed in his favor as others receiving the regular party nominations. These measures are already, for the most part, in operation in England and have been recently proposed to the New York legislature. They, too, would lift the candidate in a measure above dependence on and answerability to the party-machine—and it would place all candidates nearer on a level. Thirdly, we should rid the successful candidate of the degrading necessity of having to reward his party-workers

with offices. Even taking the ordinary ground and allowing for the moment that a man should be grateful to those who assist in elevating him to public office, though they ought rather to be grateful to him for accepting so responsible a trust in their behalf; there is no need that gratitude run to conferring offices. I do not hesitate to say that appointment to all offices not elective should be made simply for fitness and should continue during good behavior, and that the will or voice of successful candidates in elections should have next to nothing to do in the matter. Non-elective offices are almost all of a business nature, and there is hardly a business in this city that would not be well-nigh ruined, if conducted on the principles on which our post-office, or our custom-house, or our county-infirmary seems to be conducted. The maxim that "to the victors belong the spoils," is the source of more political demoralization than any other one influence in public life. It led the notorious Texas delegate to say at one of the party-conventions in Chicago eight years ago, "What are we here for but the offices?" But my particular point now is that we cannot expect more than a few of the best men in a community to stand for office in such a condition of affairs; nay, the party-machine, run on these principles, does not want the best men, it wants the most subservient men, the men who will best remember their obligations. It is this that gives so many men of moral fibre a disgust with politics, so that they feel like washing their hands clear of it; it is this that tends to invert the natural order and make private life more honorable and more dignified than public life. It is for an aroused public opinion to sweep this system of things away, to lift our public service, so far as it is not elective, out of "politics," to compel our politicians to take up questions of moment and public policy or else go out of the business, and to compel our non-elective office-holders—nay, they do not need to be compelled—to let "politics," alone.

If we could change our conception of public life, if we could attach new honor and dignity to it, if we could let the way be open for ideas to enter into politics, if we could lift our public servants above a degrading subserviency, the best men in the community would lose their repugnance to public life, and they would enter it once more to make it great and illustrious. Politics would then no longer be managed by machines or by interests, corporate or private. It would become an ennobling strife, a strife to serve, in the largest and the most radical way, the public good.

#### PLANTATION FOLK-LORE.

BY L. J. VANCE.

(Continued.)

It would be the extreme of error to suppose that tales, containing incidents which at first blush appear

silly, absurd, or impossible, are wholly destitute of literary value and interest. It seems to us that a reading public which has asked for edition after edition of stories of the "Ouida" order, may well condescend to listen to the clever and pointed tales of "Uncle Remus," or to the fright and ingenious fables of old Daddy Jack. Still, I am not disposed to set a higher value on our Negro Myths and *Märchen*, than that set on the early German Folk-stories by a critic so hard to suit as Thomas Carlyle. Certainly, it was with something like a shock of pleasant surprise to find him saying that, if the apologue of *Reynard the Fox* is nowise a perfect comic epos, it has various features of such, and, above all, a genuine epic spirit. Of course, we do not claim for the apologues of Uncle Remus and Daddy Jack anything like as high praise as that. If the present volume of "Negro Myths," had been issued during the Middle Ages it would have been known as one of the *Volks-Bücher* (People's books).\*

Once more, when so accomplished a poet and *littérateur* as Andrew Lang spends his best time and talent in poring over these "people's-books," we may rest assured that they contain some value to the student of comparative literature as well as for the comparative mythologist and ethnologist. "As a matter of fact," says Lang, "literature has borrowed far more from the people than the people have borrowed from literature, though both processes have been at work in the course of history." It can be shown that the most inspiring songs, the finest ballads, the greatest epics of a nation, have all come from one and the same source—the people. It can also be proved that where the Negro, or the German peasant, makes his characters beasts and birds, the epic poet makes them kingly heroes, or Knights of the Round Table. That the familiar tales of our childhood may be found in the *Iliad* and *Odyssey* seems strange, I take it, to most of us. Yet, such is the simple fact. As the Rev. Sir George Cox expresses it, "Until within the present generation boys read the *Iliad* and *Odyssey* and worked their way through the dramas of the Greek tragic poets under the fixed impression that they contain nothing with which children in our nurseries are familiar in other shapes." How many of us usually think of the *Nibelungentied*, the *Kalevala*, or the *Frithjof Saga*, as largely made up of the tales handed down by word of mouth from father to son, of the fairy stories told by the fireside or in the play-room, of the superstitious beliefs and practices in vogue among the common people, of the learning, or lore, in

\*Perhaps the finest collection of mediæval *Volks-Bücher* is owned by Prof. Crane of Cornell. Although these books passed through many editions, they are to-day catalogued as "scarce." One of the best known collection of tales was the *Disciplina Clericalis* (instruction for clerks or clergymen). For account of these early popular "chap-books" see Nisard's *Histoire des Livres Populaires*, and Dunlap's *History of Fiction*.

other words, of the Folk? Yet the epic poet and the Saga man have only taken a heterogeneous mass of Folk-lore and fused it into one symmetrical whole, investing his story with that peculiar beauty and charm which stamps it as a work of the highest human genius. How many of us would at first blush say that Shakespeare had borrowed as much from the people as the people had borrowed from Shakespeare? Very few; yet his wonderful dramas and plays are simply so many store-houses of traditions, customs, beliefs, of the people, of the Folk.\* Shakespeare was the English heir of ages of Folk-lore.

But to return to our "Negro Myths." The student of comparative folk-lore compares the stories, the same as the comparative philologist compares the speech, of different tribes or peoples. Holding that the *Märchen* were the exclusive possession of the Aryan race, the early students of mythology deemed it unscientific to compare the folk-stories of peoples which did not show any "tokens of affinity,"—of language, etc. But now, the thorough-going student of folk-lore believes it to be just as scientific to compare a Negro or a Hottentot fable with an Aryan fable, as to compare a German *Märchen* with a Greek or an Indian story. The question of the relation of *Märchen* to myths has been more correctly answered by those students of folk lore who hold that Negro, Hottentot, German and Hindu peasant are in the same tale. But the question here is: How do our Negro Myths and *Märchen* compare with the Myths and *Märchen* found all over the world? Now, speaking of the existence of stories and fables among the Southern Negroes, the editors of the *Journal of American Folk-Lore* say: "The origin of these stories, many of which are common to a great part of the world, has not been determined. In the interest of comparative research, it is desirable that variants be recorded, and that the record should be rendered as complete as possible."

For the purpose of this comparison, we shall here take the stories in this volume of "Negro Myths" in the order in which Mr. Jones has printed them.

No. III, "How Buh Cooter<sup>†</sup> fool Buh Deer," seems to have been an universal favorite among the Southern negroes. The fable has already appeared in three or four different versions. As told in Mr. Jones's book the story is briefly as follows: Buh Deer twits Buh Cooter because he walked so slow. Whereupon the latter challenges him to race "to de fibe mile pose," the following Monday. Now, the Cooter enters "inter

cohoot" (bargain) with five of his friends, whereby each of them is to station himself at every mile post on the day of the race. The race comes off, and Buh Deer is amazed to see Buh Cooter ahead of him at the first mile post, and so on to the fourth. "Eh so mad, eh try fuh kick Buh Cooler outer de road, an eh straighten fur de las mile pose. Wen eh git day, eh meet Buh Cooter puffin an er blowin an a leanin up gin de pose duh laugh at um." In the version given by Mr. Owen in *Lippincott's Magazine* (December, 1877), the race is between Buh Rabbit and Buh Frog. While in "Uncle Remus" we find that the race is between Brer Rabbit and Brer Terrapin. The writer in the *Riverside Magazine* for November, 1868, mentions a German version containing substantially the same incidents. Again, Dr. Bleek, in his Hottentot fable of "The Tortoises hunting the Ostriches," tells how the ostriches were compelled to run along through two rows of Tortoises, who called out as they run by, "Are you there?" And each one answered, "I am here." The ostriches kept running faster and faster until they fell down exhausted, and then the Tortoises came and devoured them. (See Bleek's Hottentot fables, No. 16, p. 32.) Once more, Prof. Crane in the article in the *Popular Science Monthly* before mentioned, calls attention a variant from Siam in the "Orient and Occident," III, 497. In Mr. Owen's version the question used by the Tortoises in the Hottentot fable is put in the form of a rhyme by the Frogs at each mile post, thus:

"Boo, hoo! Before you;  
I beat you there, I beat you here;  
I've beat you back to Miss Dinah's lap."

No. IV, "Buh Wolf, Buh Rabbit, an de Tar Baby," was another favorite with the plantation negroes. During a great drouth Buh Rabbit was too lazy to dig a well so he generously helped himself to the one which Buh Wolf had dug. The latter found this out, "an eh fix plan fuh ketch um. De same ebenin eh mek Tar Baby, an eh gone an set um right in de middle er de trail wuh lead to de spring, an dist in front er de spring." The next morning when the Rabbit came to the well with his calabash he was astonished to see the Tar Baby. As the Tar Baby would neither stand one side nor answer his questions, the Rabbit got vexed and "haul off an slap um side de head. Eh han fastne." Then Buh Rabbit hit him with the other hand, and "dat han fastne too same luk tudder." He then "kick de Tar Baby wid eh knee. Eh knee fastne." When the Rabbit butts the Tar Baby in the face and "eh head fastne same fashion luk eh han an eh knee," he becomes frightened and "eh bague; eh cry; eh holler." At this stage of the proceedings the Wolf comes, and after some parleying, says that if he knocks his brains out, "you guine dead too quick."

\* See Rev. Thibault Dyer's, "Folk-lore of Shakespeare," also M. Ritson's "Fairy Mythology of Shakespeare," etc. Referring to fairy mythology in the *Midsommer-Night's Dream*, Mr. Thoms says, "Shakespeare has embodied almost every attribute with which the imagination has invested the fairy race. \* \* \* Carefully and elaborately as he has finished the picture, he has not in it invested the 'lot of spirits' with one gift or quality which the popular voice of the age was not unanimous in bestowing upon them. Thoms's "Three Notoles on Shakespeare."

† Terrapin.

Me guine trow you in de brier patch, so de brier kin cratch you life out." The wily Rabbit, of course, begs him not to do that and "de minnit Buh Rabbit drap in de brier patch eh cock up eh tail, eh jump, an eh holler back to Buh Wolf, "Good bye, Budder! Dis de place me mammy fotch me up." This story is divided by Mr. Harris into two parts. The first part ends with the capture of the thieving Rabbit. The second part narrates the conversation between the Rabbit and the Fox, before the latter throws his victim in the brier patch. In Uncle Remus, (No. IV,) the Rabbit cries out, "Bred en bawn in a brier-patch, Brer Fox!" A variant from South America may be found in Mr. Smith's "Story of the Cotia who played Tricks on the Jaguar and outwitted him." ("Brazil, the Amazons, and the Coast," p. 549.) See also the *Riverside Magazine*, November, 1868.

In No. VII, "De King, eh Darter, Buh Wolf, an Buh Rabbit," and also in No. XIII, "Buh Wolf an Buh Rabbit," the main incident is pretty much the same. In the latter story Buh Wolf and Buh Rabbit "cote (court) de same gal." The latter in a spirit of bravado tells his lady-love that the Wolf was "nuttne (nothing) mo den eh farruh (father's) ridin horse." The Wolf hears of this boast, and determines to make the Rabbit go before "de gal" and confess his lie. So he goes to the Rabbit's house, but finds him sick in bed. He makes him get up, and the Rabbit, who is all the time feigning illness, persuades the Wolf to carry him on his back. Buh Rabbit then gets a saddle and bridle, and slips on a pair of sharp spurs. They reach the "big gate," Buh Rabbit who "slap spur to Buh Wolf, holler ter de Gal: 'Wuh me bin tell you? Juh me come pon me farruh ridin horse.' De spur hot Buh Wolf so bad eh couldnt do nuttne but run." The same story may be found in "Uncle Remus" (p. 34), where it is the Rabbit and the Fox. See also *Lippincott's*, 1877, p. 753. The "Story of the Jaguar who wanted to marry the Deer's Daughter, but was cut out by the Cotia," given in Mr. Smith's collection of Amazonian Myths, is simply the same story with different names. ("Brazil," etc., page 547.)

In No. XVII, "Buh Lion an Buh Goat," the point of the story lies in the bold answer which the Goat gives to the Lion, who is ready to devour him. "Hay! Buh Goat, wuh you duh eat? Buh Goat skade, but eh keep bole heart, an eh mek answer: "Me duh chaw dis rock, an ef you don't leff, wen me done, me guine eat you." In European *Märchen* it is a giant or an ogre who is deceived by the hero's braggadocio. See Grimm's, "The Giant and the Tailor," "The Valiant Little Taylor," (Nos. 20 and 183).

In No. XX, "De Po Man an de Snake," and in No. XXII, "De Cat, De Rat, De Cheese, an de Fox," we have

incidents more or less common to European *Märchen*. In the first named-story, after the snake befriends the poor man by giving him money, the latter turns around and tries to kill his benefactor. The second story tells how the Cat and the Rat are unable to agree upon their share of the stolen cheese, so they call in the Fox to decide. The knavish Fox says, "Begone, you rogue," and takes the cheese himself.

No. XXIX, "De Two Fren and de Bear," we recognize as a fable literally transcribed from our old friend Æsop. When the two friends meet the Bear, one of them runs away and climbs up a tree; the other who is thus left alone feigns death, and so escapes the embraces of the animal. "Wuh de Bear bin tell you?" semi-sarcastically inquires the man-from-the-tree. "Eh bin tell me nebbber fuh trus nobody wuh call ehself fren, an wuh gwine run luk er coward soon es trouble come."

(To be concluded.)

## FACTS AND PROBLEMS OF SCIENCE.\*

THE CONDITIONS OF LIFE.

BY W. PREYER.

PART III.

Translated from the German by F. W. Morton.

The inner conditions of life are much less definitely determined than the outer. By direct inner conditions of life is to be understood a certain sort of arrangement of the organic elements heretofore enumerated. This arrangement is a double one. On the one hand it must combine the elements into a series of peculiar chemical unions, which are more or less unstable. On the other hand, these chemical unions must be arranged in a series of peculiar forms, which do not exist in inorganic nature. The formation of these unions *biochemistry* seeks to explain. It has to ascertain the chemical composition of the organism in its minutest details *at every moment of life*, and to investigate the *chemical processes* which constitute the essence of the *change of matter*.

The further arrangement of the chemical unions into structures and of organs into bodies is the province of morphology, which aims to establish the anatomical composition of the organism in its minutest details *at every moment of life*, and perceive the *growth-processes* which constitute the *change of forms*.

Even at the present day, however, neither biochemistry nor morphology has accurately determined the direct inner conditions of life. The chemical unions, complicated beyond example, upon whose alternate destruction and re-construction depends finally the entire life-process, are in a high degree variable, so that only in the slightest measure can their action in the living body be discovered by artificial means.

When we say, what in itself is strictly true, that in

all living beings without exception at every time of life albumen or protoplasm is found, which is lacking in inorganic nature, we do not thereby establish an inner condition of life. Much rather we have scarcely accomplished more than if we said: In animate beings the elements are differently placed than in inanimate. • For the bioplasm in the egg and in the germ forms the basis from which all organs are differentiated; it is of itself the sole supporter of the most important functions of life, since it moves and multiplies as it breathes and nourishes itself within the organism. • It cannot, therefore, be designated as a condition of life simply, nor be used for explaining life; but this substance itself with its wonderful, changeful forms must first be explained.

By the motion of the protoplasm in the tiny germ of a seed, the surrounding earth, the air and the water are transformed under the influence of heat into a gigantic tree; and by the motion of the protoplasm in the heated egg its contents are transformed into a living animal. What produces the impulse? What forces the matter to so arrange itself that life results therefrom? Alas, chemistry cannot attain to an answer.

Morphology, too, when it shall have devoted itself more fully to the development of the parts, promises to elicit a much better knowledge of the inner conditions of life. • The ultimate parts of the organism in respect to anatomy, the simple forms to which the chemical union are applied, are, to be sure, not nearly so definitely to be traced to types or arranged in systems as are crystals in inorganic nature. What we call a cell is likewise something indefinable and variable, just as is that which we call species. The word "cell" is undeniably a very useful word; but since there are beings consisting of a single cell, which may be divided into parts, and the parts still not lose the life-phenomena of the whole, it is impossible to designate the cell as an ultimate *physiological* element, as a general condition of life, which has so often been done in the past and is still done.

With so limited a knowledge of the direct inner conditions of life, it is not to be wondered at that the indirect conditions should not have been determined, and the right course of inquiry should not have been found. It is known, that many organs are unnecessary to life, but it is not known, how many and what ones must be preserved, if the life-process is to suffer no collapse. There are men, who have lived after the amputation of both arms and both legs. In spite of this, the extremities are necessary for the maintenance of human life, for only by the hands and feet of others do the men just mentioned continue to exist.

Is the greatest part of the body indispensable to an independent existence? How much blood could one lose, without suffering death? Such questions as

a rule cannot be answered. We cannot ascertain then what parts of an organism are absolutely necessary to the maintenance of life; but in a measure we can ascertain those parts that are not necessary, because in many beings the severed portions lead lives of their own.

Although, as is seen from this whole exposition, our attainment of the conditions of life *in details* is very defective, *one* fact of extraordinary importance for an understanding of the life-process *as a whole* may be established with certainty from the knowledge alone of the direct external conditions.

The explanation of life will evidently be essentially facilitated if we can succeed in all but destroying the life of several animals by removal of the necessary outer conditions, and then after a considerable time restore life by restoring those conditions. If we were able to freeze a plant or animal body through and through, to dry one up thoroughly, to preserve one for a year wholly apart from the air in a cold exhausted space without food and without water, so that on an appointed day, after the admission of moist air it would start up in the heat and continue to live without the least injury to its health—just as if nothing had happened—then the whole method of investigating living bodies would be essentially simplified.

For, if the necessary conditions for the maintenance of all life were known, so that we could at pleasure say to lifeless beings "let there be life" and there would be life, we could then cherish even a well grounded hope of being able accurately to establish the necessary conditions for each separate function.

This production of life at pleasure, this winding up and stopping the clock of life, is in fact subject to the will of man. Nature herself performs the experiment millions of times, on a large scale or on a small one, on plants and animals, on seeds and eggs, as well as on completely formed beings, when in summer it dries up the organic dust and then after weeks of drouth restores it to life by invigorating rains, or when by currents of air nature transplants it to damp regions, and awakens it to new life.

The unwearying Leeuwenhoek was the first to make these fundamental observations. In his 144th letter on the revealed mysteries of nature he describes a series of infusoria, especially radiate animals, which on the 25th of August, 1701, he found in the water of a house gutter. This water he evaporated, and when as late as February, 1702, he took up the dry residue, he saw to his great astonishment that without exception the infusoria came to life again on being moistened with pure rain water. • He thought that all the species resuscitated by him had thick shells which in the process of drying did not permit the water in the interior to evaporate. • But this view, which was

shared by later scientists, is incorrect; because the surrounding skin or shell—which does not exist on all species—is not so thick as would be required for this. The animals rather shrink enormously, as may easily be seen with powerful magnifying glasses, so that they become unrecognizable and evidently do not contain water within the crust or shell. It is also possible, in 57 other infusoria, especially in dried *ursuli*, to note the swelling of the body and the extremities when they are moistened. This is one of the most beautiful spectacles which the microscope affords, for we see how the supposed particles of dust which only an adept can distinguish from the surrounding real dust, and then principally by their color, are brought into life.

The second observer was Turbervill Needham. In the summer of 1843 he discovered in diseased wheat little eel-like bodies which were wholly motionless and formed a thick confused mass. He moistened them so as better to observe the supposed fibres, and was highly surprised when they thereupon became alive. He was greatly perplexed at this accidentally discovered fact. He kept the mites for two years in a dry place, and ever and again they would come to life through the influence of water. His observations were confirmed and extended in the same year by Henry Baker. This scientist saw the dried animals come to life by moistening after the lapse of 27 years, just as after a few years. Similar results in respect to the same subject were attained somewhat later by Buffon, who established his priority against the great physiologist Fontana, who independently of all others made the same discovery in 1767. Buffon's account, however, is somewhat poor; and when he correctly observed and compared the anguillulae with little machines, he confused this good thought by his broader, phantastic statements respecting the living molecules.

Fontana, with brilliant success, extended his attempts at resuscitation to other animals. He dried, besides the anguillulinae, especially radiate animals, a hair worm and then brought it to life again by means of water. He felt called upon "to speak of this little wonder in a special treatise under the title: *On the Life and Apparent Death of Animals*." This treatise, however, is not extant.

The most extensive investigations respecting the resuscitation of lifeless animals were made by Spallanzani, who, in 1776, published in Modena his great work on animal and plant physics. By drying them he could make the same rotifers lifeless and by moistening them restore them to life eleven times. He found further that even at 19° below the freezing point of water and at a comparatively stronger degree of heat the dried animals still retained vitality. He it was who discovered the *ursuli*, which are especially

serviceable for such experiments, and which, being equipped with nerves, muscles and eyes are far more highly organized than any other animals revived by him.

This remarkable creature was first experimented with by C. A. S. Schultze, the first German scientist who turned his attention to the resuscitation of life. Discovered in Holland, confirmed in England and France, extended and more accurately established in Italy, the fact of revivifying small organisms made the rounds of half Europe without even a single fundamental investigation being made in Germany during more than a century. And after Schultze had published his observations in 1834 the fact was doubted by German scientists, and indeed utterly denied by Ehrenberg. In 1838, therefore, Schultze on the occasion of a scientific convention in Freiburg again set forth his discoveries. Here he showed those animals which had been called shell-animals, by Hufeland, but which he had named *macrobiotus* on account of their longevity. But Ehrenberg's strange explanation that presumably the supposed re-animated individuals were the descendants of the dried ones still for a long time kept scientists from accepting the new views.

Again came decisive work from abroad. Doyère in Paris had received some of the dried dust gathered by Schultze in Greifswald, and in 1840 and 1842 he published a notable monograph on the *ursuli*. Now investigations became more frequent. And if at the present time many do not believe in a complete cessation of the change of material at the stage which we call dried-up, there are yet facts enough to permit no further doubt.

Above all, the experiments with freezing are convincing. These can be performed with success on higher animals. Frogs, as I myself have repeatedly shown, can be frozen in all conditions to solid ice, so that the slightest trace of life no longer exists, so that no sign of vitality can be elicited from them by the greatest irritation, and then again come to life after having been thawed out, and appear just as before the experiment. Duméril, in 1852, performed such an experiment with entire success. Many fishes, we know, especially the white fish, the crucian and the pike can be frozen through and through or be left lying in the air, and still be revived on being moistened with water.

With warm-blooded animals only a very few experiments of this sort have been tried. Still, it is known that a few may be frozen even to the entire cessation of the heart's action and breathing, even to the complete disappearance of nervous and muscular sensibility, and then by careful heating become, for a time at least, alive again. And the chicken in the egg, before hatching, can be so greatly reduced in temperature, that the action of the heart ceases, with-

out suffering injury, if after a couple of days the normal heat is restored. It merely hatches so much alter, since it cannot regain the lost time. Fresh eggs, again, which have been frozen to solid ice, have developed, after gradual thawing, with complete regularity in the process of incubation.

Indeed, there are accounts from East India, attested by respectable persons, of men, who assert at least an apparent complete suspension of the life-process. The fanatical Jogins, if report be true, cause themselves to be buried for weeks at a time. They stop up the mouth and nose so as not to breathe, and accustom themselves daily to do without breathing as long as possible. Thus they seem, in fact, to have acquired the power of dispensing with air at will and of existing without food or water. It is probable, however, that this condition is more a lethargy, like the deep winter sleep of mammals, than an actual, complete stoppage of the change of matter, as is shown in the case of frozen and dried animals. The marmots, too, make no breathing motions in the deepest sleep, and the circulation of their blood, at least according to some observers, stops wholly in all confined places.

But, however it may be with the practices of the Jogins of India—even though their achievements be traced back to a wonderful art of legerdemain, and all indications pronounce against this—still the proof remains just as convincing from the experiments practiced on animals.

Besides this there are numerous observed facts of the plant world, which have in part this great advantage, viz., of applying to incomparably longer periods of time. Spallanzani saw a nostochaceæ dry up fifty times between July and October and lose its green color, and every time it became green and grew again, when, in its dried condition, it received water. Bonaventure Corti discovered in 1774 and more accurately described the revival of dried tremella by wetting with water, and of frozen tremella by supplying heat.

That the seeds of plants of the most different sorts may be kept dry for years, without losing the power of germination, has often been demonstrated by experiment. How long these may be kept, is shown by the following table:

SEEDS OF:	GERMINATED AFTER:	OBSERVER:
Radishes,	17 years,	Lefébvre.
Cucumbers,	17 "	Voss.
Mallows,	23 "	
Melons,	40—50 "	Tittmann.
Mimosa,	60—80 "	Gérardin, Van Swieten.
Rye,	140 "	Home.
Kidney beans,	17—200 "	Voss, Van Swieten.

Desmoulins tells of the seeds of several plants, which were found in graves at Rome, in 1834, and

which germinated after having lain in a dried condition for 1500 years. There are eggs of animals—though they may seem little like animals—which have already been kept more than half a century in a dry state, and still preserve their vitality. The eggs of the strudel worm (*Turbellaria*), the shell crab (*Ostracoda*), the crab flea (*Cyclopida*), and the flat-footed crab (*Apus*) bear a very protracted state of dryness without losing the possibility of development.

(To be concluded.)

#### THE SOURCE OF THE GOSPELS.

Rudolf Seydel, Professor of Theology in Leipsic, Germany, has advanced\* and very ably defended the theory that the Christian gospels have been borrowed from the Buddhist Sacred Literature, more especially from the Life of Buddha, the Hindoo Saviour. He does this not with any feeling of animosity toward the Bible, but with due reverence to Christianity and full appreciation of its ethical import. In spite of all his radical criticism, he is and remains a Christian. And the honest enquirer into truth is perhaps, even in the strictest sense of the word, a more faithful follower of Christ than many an orthodox believer in the literal inspiration of the Scriptures.

When the learned philologist Wolf first advanced his view that the poet Homer had never existed and that the Homeric epic was a collection of rhapsodies, as he called these songs, many admirers of Homeric poetry were alarmed and looked upon the great scholar's investigation as a sacrilege of poetical tradition. But we have learned to appreciate Homer more as an expression not of one individual but of the whole nation, of Greek genius itself.

Similarity we need not be afraid that Christianity will fall, if the historian proves it to be not a supernatural revelation but the natural outcome of human development. Christian ideas and Christian ideals will remain just as true. Only we will better understand them, and thereby be able to live up to their ethics. And this practical Christianity is according to Christ's own words the religion which he taught.

One of the most prominent opponents of Prof. Seydel's theory is Prof. Kuenen, who is at present a great authority on the Hebrew language and the books of the Old Testament. Kuenen objects to Seydel's evolutionary hypothesis that the Gospels developed from the Buddha legend because, as he correctly states, the New Testament is purer and nobler, simpler and more dignified than the Indian tales of Gautama Buddha.

We translate from Prof. Seydel's pamphlet, "The Buddha Legends and the Life of Jesus," on p. 25, the following passage in which he defends his position against his numerous critics:

"My attention has been called to the differences that exist and which in comparison with the resemblances are often very great and well-defined. Resemblance without any differences would be tantamount to equality. But in our case equality would be altogether inconceivable, in fact, an absolute miracle. Indeed the differences must be great, because the dissimilarity between the religions, the nationalities and the languages is so immense. Kuenen thinks that changes made in anything which has been appropriated must necessarily prove a deterioration and emasculation; whereas he sees in the gospels an improvement, a simplification and a sanctification of the fancy of the original. 'Compared with the Lahta Vistara, the gospels, and especially the first three, are exceedingly simple and temperate; nowhere do we find traces of an endeavor to let Christ vie with Buddha—in supernatural power, in the homage rendered by the inhabitants of heaven and earth, etc., etc. But there can be no doubt but that the evangelists exalt Jesus far above Buddha, the legend of whose life they have—as we suppose—learned from their ancestors and used for adornment. Is this a natural relation? Ought we not at least to expect that they would have greatly surpassed their prototype?'

"My opinion is that the Evangelists neither knew nor used the Buddha legends, but a Christian, poetical gospel, which had been modeled upon the frame work of the Buddha legend and had been written under the influence of Buddhist traditions and of many Buddhist themes,—themes in a musical sense. This work was a Christian work of art, in a similar manner as the other was a Buddhist work of art which had induced the poet to imitate it. Our evangelists found this poetical preparatory work among the "many" whom Luke mentions at the beginning of his gospel. They could use and cared to use very little of this, and they unconsciously allowed several traces of this source to remain in our gospels.

"That poet, however, was none the less a Christian. He had at his command altogether different means of surpassing the Buddha poetry, than an exaggeration of Hindoo fustian. The Hebrew and Christian earnestness and realism permitted only such use of the Hindoo poetry as we see here, and that was a great triumph for the Hebrew and Christian spirit.

"But why borrow at all? Because poets are poets. Why do our protestant artists paint ideal Madonnas, although Mary is to them not an object of worship, and why do they paint her with the halo? And has Holbein perhaps improved upon the Raphael type, by increasing the number of angels and saints, by exaggerating the divinity of Mary, or has he not, by translating the ideal of the Madonna in accordance with the feeling of the German family and the German

people, rather treated it in a manner similar to that in which the poet of the gospels treated the Buddha legends?

"In the Madonna with the infant we find, moreover, pictorially considered, a continuation and development of the Egyptian Isis-Horus group, and with what increased beauty and depth, especially in the paintings of Raphael and Holbein! In Pompeii was found a mural painting which represents Orpheus with his lyre, sitting, surrounded by animals; it corresponds in the most essential features to a picture of Christ in the Catacombs, in which, however, two sheep have taken the place of all other animals. The new church easily and gladly appropriated antique models, and the imitation of Greek prototypes is very extensive in early Christian art.

"The best and most telling reply to Kuenen's objections is to be found in the very domain of this eminent student of the Old Testament: in the relations of the Mosaic account of the creation and of the flood to their originals in the literature written in cuneiform characters. In this, just as in our case, we see a purification of pagan mythologic bombast, a translation into the language of pious earnestness and of the simple, vivid imagination of the Jews, a transformation out of the purely mythologic manner into a more historical one.

"In the history of poetry we frequently find the same theme used over and over in different periods; and, as a rule, we do not find the crudities of early forms treated with increased coarseness; but on the contrary, we much oftener discover a refinement and a nobler application of their essential parts, ever and again elaborated and remodeled. We need but recall the best known instances, Shakespeare and the Italian novels, Lessing's Nathan the Wise, and Goethe's Faust."

#### THE STARS.

BY \* \* \*

Ye golden stars in silent holy night,  
When breaks the day, in mighty competition  
Your brilliance dims 'mid rapid demolition,  
Ye and your splendor, beautiful and bright,

Ye fade away in its victorious light.  
Thus ends romance; poetic superstition  
Of darker ages suffers abolition.  
In light ye die, light-bearers of the night.

And yet ye are not dead, ye golden stars;  
Ye still are living in the brighter ray;  
No, not your light, the glorious sun-god mars;

Ye disappear; ye hide your radiant beauty  
Submissive sacrifice to faithful duty;  
But brighter beauty shines in dawn of day.

## CORRESPONDENCE.

## THE ANÆSTHETIC REVELATION.

To the Editor of THE OPEN COURT:

Mr. Xenos Clark's communication under the above heading, and his statement that "some psychologists" have been led "to declare the impossibility of considering the phenomenon a dream," etc., induce me to offer a few brief observations. Sir Humphry Davy once inhaled twenty quarts of unmingled nitrous oxide, and his subsequent "experiences" while in a state of gaseous exaltation have, I believe, often been alluded to by Spiritualists as tending to prove the existence in man of an immaterial vital essence. In his own account of what transpired after his awakening by Dr. Kinglake, Sir Humphry says that "indignation and pride were the first feelings produced by the sight of the persons about me. My emotions were enthusiastic and sublime; and for a moment I walked round the room, perfectly regardless of what was said to me. As I recovered my former state of mind, I felt an inclination to communicate the discoveries I had made during the experiment. I endeavored to recall the ideas; they were feeble and indistinct; one collection of terms, however, presented itself; and with the most intense belief and prophetic manner, I exclaimed to Dr. Kinglake, 'Nothing exists but thoughts! The universe is composed of impressions, ideas, pleasures, and pains.'"

Now if, with the psychologists alluded to by Mr. Clark, we so regard the emotions resulting from the hyperæsthesia of intoxication by nitrous oxide gas as to claim for them a place as "genuine philosophic insight," it seems to me that the only philosophy deducible therefrom is necessarily that of absolute Idealism. If psychology be a science, it must consist solely of the known and the knowable, since the *qual* of acknowledged insolubilities and of metempsychoses cannot enter within the domain of knowledge. For my part I shall rejoice if psychology—which, as G. H. Lewes says, "investigates the human mind, not an individual's thoughts and feelings, and has to consider it as the product of the human organism," be found ultimately to confirm the proposition of Berkeley that "the objects of knowledge are ideas, and nothing but ideas," because ideas are material things, the product of cerebration, so that after all, Idealism is itself Materialism. "Potentially," writes Lange, "the mind already includes within itself all that can be thought," a significant statement which may be placed in juxtaposition with Berkeley's claim that he had shown that ideas "exist only in the mind that perceives them." Conceding this, is it not evident that Sir Humphry Davy and other anæsthetic dreamers can give us no other "explanation of the universe" than the ideal one? When entranced, whether by sulphuric ether, by opium, or by hashish, and also when sober man lives in a world of ideas, and his universe is really an ideal one; his life without the mind-picture, the idea, would be as unconscious as that of a vegetable. Only, while in the state of exaltation, the person subjected to the stimulant inhabits a world in which merely the imaginative faculty is active, and so active—as in the case of Davy—as to permit "trains of vivid visible images" to career before the mental vision, these images being "connected with words in such a manner as to produce perceptions perfectly novel." I hope it will not be considered as indicative of what I may term Professional Agnosticism,—which I do not particularly admire—when I affirm that man's nature is a *res disjuncta* from what is outside of its own cognition. With all respect to the psychologists, I may be permitted to express my conviction that the world will derive as much knowledge from the visions of anæsthetics as from those of Jeremiah and Ezekiel. In both forms or phases of exaltation—the gaseous and the theomantic—the emotional phenomena are identical. We find in both lofty sublimity and high enthusiasm. Fortunately for himself, the gas-inspired visionary soon

returns to his normal condition of sanity, whereas the victims of what alienists term religious excitation may continue for many years to breathe an unreal atmosphere and to figure as mystagogues, until perchance mental restoration follows upon a tragedy like that of Pocasset or an all-sufficient cure be effected by a consummation like that of Calvary.

M. C. O'BRYNE.

## BOOK REVIEWS.

SANDRA BELLONI, *Geo. Meredith*, Boston. Roberts Bros.

Mr. Meredith is the author of long delayed success, whose late popular welcome to the ranks of fictitious literature ought to compensate in some degree for his early trials. The author of Richard Feverel is the greatest English novelist of the day, according to the well-spoken judgment of some of the most competent critics. His fire, vigor, piquant style, a mastery knowledge of the human species, as found on the soil of his native England, is beyond compare. Sandra Belloni holds a worthy place among the other works which the enterprising firm, republishing them in this country, is issuing. It is of even more attracting interest than *Feverel*. Each character is a study fitting with admirable naturalness into the narrative. The touch of genius is on every page of this writer's works.

C. P. W.

IS PROTECTION A BENEFIT. *Edward Taylor*. Chicago. A. C. McClurg & Co.

The answer which the writer makes to the question forming his title may be premised from the motto from Bentham on the title page, "Industry makes to Legislation the modest request of Diogenes to Alexander, 'Stand out of my sunshine.'" The book is a compact treatise on Free Trade, combining an historical sketch of the tariff system in continental Europe, England and this country. The opening lines of the introduction have a peculiar aptness in these days of Presidential conventions and all the blare and noisy assumption of pretended political issues. "For more than twenty years our national politics have looked toward the past and not toward the future," but the time is coming, the author thinks, and we trust with him, when "arguments upon economic, political and moral questions are to take the place of old-time appeals to local prejudices and sectional animosities." Mr. Taylor's book is well fitted to prepare the way for an intelligent consideration of the higher, intellectual and moral questions involved in our national politics. C. P. W.

MATERIALIEN AUS DEM KATHECHUMENEN-UNTERRICHT VON DR. H. ELTESTER. Second edition, edited and revised by H. Ritter. Berlin: 1888. Georg Reimer.

In 1868, one year before his death, Dr. Eltester gave to the world the first edition of the work before us. In the preface to that edition he tells us that he presents the methods and substance of his teachings for many years in the rudiments of Christian Doctrine. He confesses the plan is unsystematic, having followed simply the lines of instruction as laid down in the conventional catechism. He professes to give nothing more than scattered fragments and probably suggestive material from the sphere of his personal instruction, making no pretension to uniformity, consistency or logical completeness. Dr. Eltester says he has always found completeness and uniformity of treatment monotonous and wearisome in sermons, and that, in juvenile instruction especially, such qualities of excellence would more impede instruction by producing inattention than would shortcomings in method or presentation of material. A similar avowal would scarcely be tolerated in any branch of secular instruction, and we must seek its justification in the nature of the subject. We admit that there is a goodly bit of volatility about such topics as Consubstantiation and the Trinity of the Godhead, and that they must be approached in the manner least calculated to endanger their confinement; but, with it all, the sense of scientific propriety should demand a fairer and more rigid

treatment of any subject, whether it be a Lutheran catechism or a treatise on meteorology. Dr. Eltester's death followed soon upon finishing the Sixth Commandment. The work came into other hands, and thus was added another element of incompleteness. The present editor tells us, however, that the demand for the book has never decreased, the first edition becoming exhausted in twenty years, and we must infer that the work has accordingly fulfilled its mission. It remains merely as its title suggests, materials, or rather fragments of catechismal instruction. jusp.

LIFE OF DR. ANANADIBAI JOSHEE. *Mrs. C. H. Dall*, Boston. Roberts Bros.

Dr. Ananadibai Joshee did not live to win that deserved fame and recognition of her heroic qualities which her kinswoman, the Pundita Ramabai has gained for herself. The latter, through her efforts to establish a school in India for the protection and education of high caste widows has become well known in this country where she is about completing her travels. The story of Dr. Joshee, who left home at the age of eighteen to come to this country to study medicine that she might return to India to practice this merciful art among her countrywomen, is one of the most touching narratives we ever read. Her untimely death has cast a halo around that youthful figure, which her gentle and heroic character well deserved. Mrs. Dall, an intelligent and interesting writer always, has told the story with her usual directness of style, and a warm sympathy vivifies the book from beginning to end. The work will do much to increase the rising interest in India, land of wisdom and benighted superstition, of general education and prepare the way for the active and intelligent co-operation of more favored lands to the end of her growing culture and civilization. C. P. W.

"The longer we live, the more we find we are like other persons," says Dr. Oliver Wendell Holmes, in a recent essay. And George Sand, in her preface to "André," quotes approvingly the Italian proverb, *Tutto il mondo è fatto come la nostra famiglia*. ("All the world is made like our own family") These opinions are significant. It is natural for men to believe in Ormuzd and Ahriman, in heroes and villains, in geniuses and dunces, to paint black very black and white very white, to have sharp division between right and wrong, to give intense worship to the things they believe to be worshipful, and intense hatred to those that are hateful. It is natural also for men to range themselves on the right hand of the Lord, and to surrender the left to those who differ from them in creed, in temperament, in morals, in conventions, in hereditary training, in opinions. Men and races commence by believing themselves the chosen people, their gods the only gods, their prophets the true prophets, their warriors the bravest and most glorious. Outside of the little radius of land that they occupy is *terra incognita*, inhabited only by barbarians and Philistines.—W. S. WALSH, in *Lippincott's* for July.

#### NOTES.

THE OPEN COURT has received from Professor Ernest Mach an essay entitled "*Ueber Umwidmung und Anpassung im Naturwissenschaftlichen Denken*" (Transformation and Adaptation in Scientific Thought). This article was delivered as an address in October, 1883, when Prof. Mach assumed the rectorate of the University of Prague and will now be published for the first time in an English translation, to appear in Numbers 46 and 47 of THE OPEN COURT. The Essay will be found to be unusually suggestive, emphasizing and analyzing, as it does, the unity of development in scientific thought. The eminent physicist has not directly treated this theme elsewhere in his scientific publications, although the idea has been incidentally touched upon in many of his works. Prof. Mach's treatise on Mechanics which has recently appeared in the International Science Series, is per-

haps the most representative of his works, but to fully appreciate his position in the world of science, we must look to his earlier publications, when the ideas he advanced were not shared by all scientists and were not so generally accepted as at present, similar ideas having been later expressed by Kirchhoff and Helmholtz. We may refer to "*Die Geschichte und die Wurzel des Satzes der Erhaltung der Arbeit*" (Prague, Calve, 1872), "*Die Gestalten der Flüssigkeit*" (Prague, Calve, 1872), and "*Die ökonomische Natur der physikalischen Forschung*" (Vienna, 1881). The spirit and tendency of Prof. Mach's works are, as he himself says, elucidative or anti-metaphysical: they oppose empty speculation. The idea that Science is Economy of Thought lies at the basis of Prof. Mach's views.

In our discussion of the Field-Ingersoll controversy we pointed out the unity of mankind and the continuity of ideas which grow and develop as they are handed down from generation to generation. The unity of the intellectual life of mankind is touched upon by Gustav Freytag in the chapter of *The Lost Manuscript*, published in this number. Contemplating the insignificance as well as the immeasurable importance of the individual in his relation to the great whole, Professor Werner says (page 1085 of THE OPEN COURT):

"Whilst man struggles for himself and his own ends, he unconsciously influences his own time, and his own people for all futurity. By ennobling the ideals and duties of future generations, he pays his own debt to life. Death vanishes from history in such a conception. The result of life becomes more important than life itself."

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

##### CHAPTER XIX.

##### THE ILLNESS.

It was the first burst of spring in the wood and gardens adjoining the city. The buds and the caterpillars had slumbered together in quiet winter dreams; now the leaves expanded, and the grubs crawled over the young green shoots. Under the bright rays of the sun in its higher course, the struggle of life began,—the blooming and withering, the rich colors, and the frost under which they were to fade, the bright green leaves and the caterpillars that gnawed them; the eternal strife began anew in buds and blossoms just as in the heart of man.

Ilse, in her hours of instruction, was now reading Herodotus; he, too, was a harbinger of spring for the human race; hovering above the borderland between dreamy poetry and unclouded reality, the glad proclaimer of a time in which the people of the earth rejoiced in their own beauty and perfection, and first began to seek seriously truth and knowledge. Again Ilse read with passionate excitement the pages which brought a shattered world before her eyes with such vivid reality. But there was not the same serene and exalted pleasure in the narrative as in the works of the great poet who so directed the fate and deeds of his heroes as to produce a pleasing impression upon the mind, even when they excited sorrow and fear. For it is the privilege of human invention to form the

\* Translation copyrighted

world as the tender heart of man desires it; with alternations and fitting proportions of happiness and sorrow, the recognition of each individual according to his powers and actions, and due compensation. But the mind which here delineated the life of the past, did so in a superhuman manner, life crowded life, so that one devastated the other, destruction mercilessly overtook them, good and bad alike; here too, there was retribution; here, too, there was, a curse, but their effect was incomprehensible and cruel. What was good ceased to be good, and evil gained the victory. What was first a blessing afterwards became ruin; what was now beneficent greatness and dominion, afterwards became a disease, which destroyed the state. The individual heroes were of little importance; if a great human power rose and dominated for a moment, Ilse soon saw it disappear in the whirling stream of events. Croesus, the over-confident, good-hearted king, fell; the powerful Cyrus passed away, and Xerxes was beaten. But nations also sank, the blooming flower of Egypt withered, the golden realm of Lydia was shattered, and mighty Persia first corrupted others and then itself. In the young Hellenic people, that rose with such heroic strength, she already saw busily at work violence, evil deeds, and enmities, through which the most beautiful picture of antiquity, after short prosperity, was to pass away.

Ilse and Laura were sitting opposite each other, with an open book lying between them. Laura, indeed, was not admitted to the private lessons of the Professor, but her soul faithfully accompanied Ilse on the path of learning. Ilse imparted the acquisitions of her hours of instructions to her, and enjoyed the sweet pleasure of infusing new ideas into the mind of her friend.

"I felt great indignation at this Xerxes," cried Laura, "even from what I read in the primer:

"Xantippe was a cross, mean thing  
No peace her husband had.  
But Xerxes was a Persian King  
And he was just as bad."

I long thought that Xantippe was his wife, and I wish he had had her. On the other hand, look at the three hundred Spartans who sent the others home and encircled themselves with wreaths, anointed themselves, and put on the festive garb to march to death. That elevates the heart; they were men. If I could show my veneration for their memory by means of my stupid head and weak hands, I would work for it till my fingers ached. But what can a poor creature like me do? At the utmost, embroider traveling-bags for their journey to the lower world, and these would come two thousand years too late. We women are pitiable creatures," she exclaimed, with vexation.

"There were others in the battle," said Ilse, "who affected me more than the three hundred Spartans. These were the Thespians, who fought and died with them. The Spartans were impelled by their proud hearts and the strict discipline and commands of their rulers. But the Thespians died willingly. They were a small people, and they well knew that the greatest honor would attach to their distinguished neighbors. But they were faithful in their humble position, and that was far more self-sacrificing and noble. Ah! it was easy for all of them," she continued, sorrowfully; "but for those who remained behind, their poor parents, wives and children at home, what destruction of happiness and unspeakable misery!"

"Misery!" cried Laura; "if they thought as I do, they were proud of the death of their loved ones, and like them wore garlands in their sorrow. What is the purpose of our life if we cannot rejoice in giving ourselves up for higher things?"

"For higher things?" asked Ilse. "What men value higher than wife and child, is that higher for us also? Our duty is to devote our whole hearts to them, our children, and our home. When, therefore, they are taken from us, our whole lives are desolated and nothing remains but endless sorrow. It is natural for us to view their vocation differently than they do themselves."

"I would like to be a man," cried Laura. "Are we then so weak in mind and spirit, that we must have less enthusiasm, less feeling of honor, and less love for our Fatherland than they? It is a fearful thought to be one's whole life long only the waiting-maid of a master who is no stronger or better than oneself, and who wears overshoes, that his feet may not get wet, and a woollen muffler the moment a breath of cold air blows."

"They do wear these things here in the town," replied Ilse, laughing.

"Yes, nearly all of them do," said Laura, evasively; "but believe me, Frau Ilse, these men have no right to expect us to devote our whole heart and lives to them. It is just the most thorough of them that do not give us their full heart. And how should they? We are good enough to entertain them, and darn their stockings, and perhaps become their confidants, if they should accidentally be at a loss what to do; but the best of them look beyond us to the great All, and in that is their special life. What is right for them should also be fitting for us."

"And have we not enough in what they give us of their life?" asked Ilse. "If it is only a portion it makes us happy."

"Is it happiness never to experience the highest

of emotions?" exclaimed Laura. "Can we die like Leonidas?"

Ilse pointed to the door of her husband's room. "My Hellas sits there within and works, and my heart beats when I hear his step, or only the scratching of his pen. To live or die for the man one loves is also an elevating idea, and makes one happy. Ah, happy only if one knows that one is a source of happiness to him also!"

Laura threw herself at the feet of her friend, and looked entreatingly into her anxious face. "I have made you serious with my prattling, and that was wrong of me; for I would gladly conjure a smile to your lips every hour, and always see a friendly light in those soft eyes. But do bear with me; I am a strange, unaccountable girl, and often discontented with myself and others, and frequently without knowing why. But Xerxes was a good for nothing fellow, to that I stick; and if I had him here I could box his ears every day."

"At all events he received his due," replied Ilse.

Laura started suddenly. "Was that a proper retribution for the wretch who had destroyed or made miserable hundreds of thousands, to return home without a scratch? No punishment would be severe enough for such a wicked king. But I know right well how he became so; his mother and father spoiled him; he had always lived at home, had grown up in luxury and all men were subject to him. And so he treated all with contempt. It would be the same with others if they were in the same position. I can well imagine myself such a monster, and many of my acquaintances too."

"My husband?" asked Ilse.

"No, he is more like Cyrus or Cambyses," replied Laura.

Ilse laughed. "That is not true. But how would it be with the Doctor over there?"

Laura raised her hand threateningly towards the neighboring house. "He would be Xerxes, just as he is in the book, if one could think of him without spectacles, in a golden dressing-gown, with a sceptre in his hand, without his good heart (for Fritz Hahn undoubtedly has that); somewhat less clever than he is, and still more spoilt, as a man also who has written no book, and learnt nothing but to treat others badly; he would then be Xerxes out and out. I see him sitting before me on a throne, by a brook, striking the water with a whip because it made his boots wet. He might have become a very dangerous fellow if he had not been born here close to the city park."

"I think so too," replied Ilse. In the evening, in the course of her hour of study, Ilse said to her husband: "When Leonidas died with his heroes, he saved his countrymen from the rule of foreign barbar-

ians; but after him many thousands of these glorious men fell in the civil wars of the cities. In these quarrels the people became deteriorated, and before long other strangers came and deprived their descendants of their freedom. For what end did these many thousands die?—of what use was all the hatred, and enthusiasm, and party zeal?—it was all in vain, it was all a token of decay. Man is here like a grain of sand that is trodden down into the earth. I find myself facing a terrible mystery and I am afraid of life."

"I will endeavour to give you a solution," replied her husband, seriously; "but the words which I am now about to speak to you are like the key to the chambers of the wicked Bluebeard: do not open every room too hastily, for in some of them you will discover what, in your present frame of mind, may raise anew your fears."

"I am your wife," cried Ilse, "and if you have any answer for the questions which torment me I demand it of you."

"My answer is no secret to you," said the Professor. "You are not only what you consider yourself—a human being born to joy and sorrow, united to individuals by nature, love, and faith—but you are bound body and soul to an earthly power, of which you think but little, but which, nevertheless, guides you from the first breath you drew to the last gasp of life. When I tell you that you are a child of your people, and a child of the human race, the expression will come so naturally to you that you will not assign any deep meaning to it. Yet this is your highest earthly relation. We are too much accustomed from childhood on to cherish in our hearts only the individuals to whom we are bound by nature or choice, and we seldom stop to think that our nation is the ancestor from whom our parents are descended, that has produced our language, laws, manners, that has given us all we possess, given us everything that constitutes our life, and almost all that determines our fortunes, and elevates our hearts. Yet not our nation alone has accomplished this; the peoples of the earth stand to one another as brothers and sisters, and one nation helps to decide the life and fate of others. All have lived, suffered, and worked together, in order that you may live, enjoy, and do your part in life."

Ilse smiled. "The bad king Cambyses, and his Persian also?"

"They also," replied the Professor; "for the great net of which your life is one of the meshes, is woven from an infinite number of threads, and if one had been lost the web would be imperfect. Take first a simple illustration. You are indebted to the people of a period, of which every record is now wanting, for the table by which you sit, the needle which you hold in your hand, and the rings on your fingers and in your

ears; the shuttle was invented by an unknown people in order that your dress might be woven, and a similar palm-leaf pattern to that which you wear, was devised in the manufactory of a Phœnician."

"Good," said Ilse; "that pleases me; it is a charming thought that antiquity has provided so considerably for my comfort."

"Not that alone," continued the scholar. "What you know, and believe also, and much that occupies your heart, has been delivered to you through your nation from its own and foreign sources. Every word that you speak has been transmitted and remodelled through hundreds of generations, to receive thereby that sound and significance which you now so easily command. It was for this object that our ancestors came into the country from Asia, and that Arminius struggled with the Romans for the preservation of our language, that you might be able to give Gabriel an order which both could understand. It was for you the poets lived, who, in the youth of the Hellenic people, invented the powerful rhythm of the epic verse, which it gives me such pleasure to hear from your lips. Furthermore, that you may believe, as you do, it was necessary that three hundred years ago there should take place in your Fatherland a great and might struggle of opinion; and again, more than a thousand years earlier, a mighty conflict of the soul in a small people of Asia; and again, fifty generations earlier still, venerated commandments given under the tents of a wandering people. You have to thank a past which begins with the first life of man on earth for most that you have and are, and in this sense the whole human race has lived in order that you might be able to live."

Ilse looked excitedly at her husband. "The thought is elevating," she exclaimed, "and is calculated to make man proud. But how does that agree with this same man being a nonentity, and crushed like a worm in the great events of history?"

"As you are the child of your nation, and of the human race, so has every individual been in every age; and as he has to thank that greater human fabric, of which he is a portion, for his life and nearly all its content, so is his fortune linked to the greater fortune of his nation and to the destiny of mankind. Your people and your race have given you much, and they require as much from you. They have preserved your body and formed your mind, and they demand in return your body and mind. However lightly and freely you move about as an individual, you are answerable to these creditors for the use of your freedom. Whether, as mild masters, they allow you to pass your life in peace, or at some period demand it of you, your duty is the same; whilst you think that you live and die for yourself, you live and die for them.

Contemplated in this way, the individual life is immeasurably small compared with the great whole. To us, the individual man who has passed away can only be discerned in so far as he has influenced others; it is only in connection with those who preceded him, and those who come after him, that he is of importance. But in this sense great and little are both of value. For every one of us who brings up his children, or governs the State, or in any way increases the welfare, comfort, and culture of his race, performs a duty towards his people. Countless numbers do this, without any personal record of them remaining; they are like drops of water, which, closely united with others, run on as one great stream, not distinguishable by later eyes. But they have not on that account lived in vain; and, as countless insignificant individuals are preservers of culture, and workers for the duration of national strength, so the highest of powers, individuals—the greatest heroes and the noblest reformers—only represent in their lives a small portion of that national strength. Whilst man struggles for himself and his own ends, he unconsciously influences his own time, and his own people for all futurity. By ennobling the ideals and duties of future generations, he pays his own debt to life. You see, my beloved, how death vanishes from history in such a conception. The result of life becomes more important than life itself; beyond the man is the nation—beyond the nation is mankind; every human being that has moved upon earth has lived, not only for himself, but for all others, and for us also; thus our life has been benefited by him. As the Greeks grew up in noble freedom and passed away, and as their thoughts and labors have benefited later generations of men, so our life, though it moves in a small circle, will not be useless to future generations."

"Ah!" cried Ilse, "that is a view of earthly life which is only possible to those who do great things, and in whom later times will take an interest; my blood runs cold at the thought. Are men, then, only like flowers and weeds, and a nation like a great meadow, and what remains, when they are mowed down by time, only useful hay, for later generations? Surely all that once existed and all existing at present have lived also for themselves, and for those whom they have loved, for wife and children and friends, and they were something more than ciphers among millions; something more than leaves on an enormous tree. Though their existence is so insignificant and useless, that you can perceive no trace of their work, yet the life and the soul of the beggar and the life and the soul of my poor invalid in the village are guarded by a power which is greater than your great net that is woven of the souls of men."

She arose and gazed anxiously into her husband's

face. "Bow your human pride before a power that you do not understand."

The scholar looked at his wife with deep solicitude. "I do bow humbly before the thought that the great unity of human beings on this earth is not the highest power of life. The only difference between you and me is, that my mind is accustomed to hold intercourse with the higher powers of earth. They are to me revelations so holy and worthy of reverence, that I best love to seek the Eternal and Incomprehensible by this path. You are accustomed to find the inscrutable in the conceptions which have been impressed on your mind through pious traditions; and I again repeat what I before said, your faith and yearnings arise from the same source as mine, and we seek the same light, though in different ways. What the Gods, and also the Angels and Archangels were to the faith of earlier generations—higher powers which, as messengers of the Highest, hovered about and influenced the lives of men—the great intellectual unity of nations and mankind are in another sense to us, personalities which endure and yet pass away, though according to different laws from what individual men do. My endeavour to understand these laws is one form of my piety. You yourself will gradually learn to appreciate the modest and elevating conceptions of the holy sphere in which I live. You also will gradually discover that your faith and mine are about the same."

"No," cried Ilse, "I see only one thing, a great gulf which divides my thoughts from yours. Oh, deliver me from the anguish which tortures me in my concern for your soul."

"I cannot do it, nor can it be done in a day. It can only be done by our own lives, by thousands of impressions and by thousands of days, in which you will become accustomed to look upon the world as I do."

He drew his wife, who was standing as if transfixed, nearer to him. "Think of the text: 'In my father's house are many mansions.' He who so spoke knew that man and wife are one through the strongest of earthly feelings, which bears all and suffers all."

"But what can I be to you to whom the individual is so little?" asked Ilse, faintly.

"The highest and dearest being on earth, the flower of my nation, a child of my race in whom I love and honour what was before and will survive us."

Ilse stood alone among the strange books; without, the wind howled round the walls, the clouds flitted across the face of the moon; soon the room became dark, and then was lighted up by a pale glimmer. In the flickering light the walls seemed to spread and rise to an immeasurable height; strange figures rose from among the books, they glided by the walls, and

were suspended from the ceiling, an army of grey shadows, which by day were banished to the bookshelves, now came trooping towards her, and the dead who continued to live as spirits on earth stretched out their arms to her and demanded her soul for themselves.

Ilse, with head erect, raised her hands on high, and called to her aid the beautiful images, which from her childhood had surrounded her life with blessing, white figures with shining countenances. She bent her head and prayed: "O guard the peace of my soul."

When Ilse entered her room she found a letter from her father on her table; she opened it hastily, and, after reading the first lines, sank down sobbing.

Her father had informed her of the death of an old friend. The good pastor had been borne away from the narrow valley to the place of rest, which he had chosen in the churchyard, near his wife. He had never recovered from the disquiet which the departure of Ilse had caused him; he had passed the winter in lingering illness, and one warm spring evening death came upon him while sitting before his peach-tree in the garden. There the faithful servant found him, and ran with the terrible news to the manor. A few hours before he had requested Clara to write to his dear child in the city, that all was well with him.

Ilse had often been anxious about the life of her friend during the winter, so the account was not a surprise to her. Yet now she felt his loss as a terrible misfortune; it was a life which had been firmly and faithfully devoted to her; she well knew that in later years she had become almost exclusively the object of his thoughts and fond affections. She had abandoned one who had been part of her life, impelled by a stronger feeling, and it now appeared as if she had done wrong in parting from him. She saw the staff broken which had bound her firmly to the feelings of her childhood. It seemed as if the ground tottered beneath her, as if all had become insecure, the heart of her husband, and her own future.

The Professor found her dissolved in tears and bending over the letter; her grief moved him, and he anxiously begged her to think of herself. He spoke to her tenderly, and at last she raised her eyes to him and promised to be composed.

But it was in vain. After a few hours he was obliged to carry her to bed.

It was a dangerous illness. There were days in which she lay unconscious in death-like weakness. When, at times, she opened her weary eyes, she looked into the careworn countenance of her husband, and saw Laura's curly head tenderly bending over her; then all would vanish again in vague insensibility.

(To be continued.)

## PAMPHLETS ON LIVING QUESTIONS.

**Truths for the Times.** By Francis Ellingwood Abbot. "The great inspiration of the nineteenth century is faith in the ideal unities as possible in fact." Price, 10 cents; 10 copies, 30 cents; 100 copies, \$1.00.

**Fear of the Living God.** By O. B. Frothingham. Price, 5 cents.

**Lecture on the Bible.** By Rev. Charles Voysey. Price, 10 cents; 10 copies, 30 cents.

**Christian Propagandism.** By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 30 cents.

**God in the Constitution.** By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 30 cents.

**Compulsory Education.** By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.

**The Present Heaven.** By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.

**The God of Science.** By Francis Ellingwood Abbot. Price, 10 cents.

**On the Vision of Heaven.** By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.

**A Study of Religion.** By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 30 cents.

**The Battle of Syracuse.** Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 30 cents; 100 copies, \$3.00.

**The Bible and Science.** By John Weiss. Price, 10 cents.

**The Sympathy of Religions.** By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.

**Transcendentalism.** By Theodore Parker. 39 pages. Price, 5 cents.

**The Public School Question,** as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.

**How Shall We Keep Sunday?** An Answer in four parts. 1. Sunday in the Bible, by Charles K. Whipple. 2. Sunday in Church History, by Minot J. Savage. 3. Sunday in the Massachusetts Laws, by Charles E. Pratt. 4. The Workingman's Sunday, by William C. Gannett. 104 pages. Price, 10 cents.

**Evolution and Religion.** By John Fiske. Price, 5 cents; 10 copies, 25 cents.

**Giordano Bruno and the Relation of his Philosophy to Free Thought.** By Thomas Davidson. Price, 10 cents.

**An Agnostic View of the Doctrine of Vicarious Atonement.** By W. H. Spencer. Price, 5 cents; 10 copies, 25 cents.

**Evolution in its Relations to Evangelical Religion.** By B. F. Underwood, Prof. P. A. Cladbourne and Prof. Asa Gray. Price, 5 cents; 10 copies, 25 cents; 100 copies, \$1.00.

**Messianic Expectations.** By Rabbi Solomon Schindler. I. Introductory, 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents; ten sets for \$1.00.

**The Proposed Christian Amendment to the Constitution of the United States.** Price, 5 cents; 10 copies, 25 cents.

**The Scientific and Metaphysical Methods in Philosophy,** as affecting certain problems of religion and life. By Lewis G. Jones. Price, 10 cents.

**Social Ideals.** By David A. Wasson. Price, 10 cents.

**The Decay of the Christian Church:** its Causes and Remedy. By Rev. J. C. F. Grumbine. Price, 15 cents.

**A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.**

CHARLES H. KERR & CO., Publishers.

175 Dearborn Street, Chicago.

## CONTENTS OF RECENT NUMBERS

## OF "THE OPEN COURT."

## BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.

FELIX L. OSWALD, M. D. In Nos. 27, 29, 31, 33, 34, 36, 38, 40 and 42.

The Science of the thousand-fold moral effects of physical causes is still a sealed book to a large plurality of our fellow-men. The ethics we have inherited is biased by the tenets of an anti-physical and anti-natural philosophy, and the tendency of the latter has ever been to sanction and exaggerate the physical effects of moral causes. Dr. Oswald says: "Our entire system of moral education needs a thorough revision, and the success of urgent social and ethical reforms depends on the radical reconstruction of moral philosophy on a basis of natural science." The subject is treated in the graphic manner which has ever characterized Dr. Oswald's contributions to the Literature of Natural History and Anthropology. It is marked by the usual wealth of illustration and abounds in felicitous and pertinent citations of historical and natural evidence.

## THE FIELD-INGERSOLL CONTROVERSY.

An editorial discussion of the Field-Ingersoll Controversy and of Mr. Cladstone's Remarks upon the same will be found in Nos. 43 and 44. The questions and issues involved are treated from an independent and impartial standpoint. The inefficacy of Agnosticism to approach a solution of the religious problem is shown; Agnosticism being but a negative view of the world. The true position

and significance of both parties in the development of the religious idea are pointed out and each is recognized as important and necessary to the ultimate synthesis of religious truth, a religion which will in elude what is good in all.

## PLANTATION FOLK-LORE.

L. J. VANCE.....In No. 41.

Mr. Vance reviews and discusses the movement and widespread interest in popular tales which has produced the recent collections of Negro Myths by Joel Chandler Harris ("Uncle Remus") and Mr. Charles C. Jones. These tales form an important addition to the Folk-Lore of the New World, and Mr. Vance's review will be welcomed by all who wish to acquire a comprehensive estimate of the significance of these Myths to comparative literature and the science of comparative ethnology.

## THE ANIMAL SOUL AND THE HUMAN SOUL.

CARUS STERNE.....In Nos. 37, 41 and 43.

An essay full of fine thought and psychological depth. Carus Sterne well understands to follow a subject as historically developed in the realm of human opinion and as ultimately affected by the light of Modern Science. The question of the relation of the animal to the human soul has ever been of interest and in this essay we find it attractively yet accurately treated.

## THE FUNDAMENTAL PROPERTIES OF MATTER.

J. G. VOGT.....In Nos. 29, 31 and 34.

To the kinetic conception of the world's mechanism Vogt opposes his hypothesis of a continuous world-substance completely filling space and whose sole manifestation of power consists in contraction or condensation. He claims that the kinetic or mechanical theory which explains organized and spiritual phenomena from inelastic atoms and a purposeless force, is untenable; and that pseudo-monomism which transforms the most complex conditions and processes of psychical life into the elementary substance itself, involves the fallacy of idealism and dualism. As opposed to both views Vogt propounds his conception which he calls Monism of Reality. He attributes to matter two fundamental properties, motion and sensibility, and deduces from these elementary properties the higher phenomena of intellectual life.

## THE INDIVIDUALITY OF ATOMS AND MOLECULES.

REV. H. H. HIGGINS M. A., Jr. Nos. 41 and 42.

Mr. Higgins says: "Evolutionists have to choose between discontinuity and the recognition of a universal principle of life, which may be regarded as mechanical, but as inherent in the primordial atom." This idea underlies the theory of J. G. Vogt also. But Mr. Higgins attributes an individual *élan*, or life-unit, to every atom, while Vogt postulates a continuous, contractile, elastic world-substance, wherein the atoms of modern chemistry are made to be centres of condensation. Mr. Higgins hypothesis endows each atom with an idiosyncrasy which comprehends all that determines its individuality and makes it what it is. The essay should be read in connection with a letter in No. 43 upon "The Origin of Life and the Problem of Memory."

## FREE-WILL A MECHANICAL POSSIBILITY.

XENOS CLARK.....In No. 39.

Mr. Xenos Clark here presents in an interesting and attractive manner certain scientific analogies bearing upon Free-Will and Determinism. A novel and ingenious application is made here of the theory of linkages and link-work which of late has so interested mathematicians and been developed with such striking success by Prof. Sylvester. The article will be found to be unusually suggestive, although it is not in accord with THE OPEN COURT, which, in an editorial of No. 33, admits the truth of both *Free-Will* and *Determinism*.

## ECONOMIC CONFERENCES.

WHEELBARROW.....In Nos. 37 and 40.

The Economic Conferences of Chicago may be hailed as a significant indication of a breach in the barrier between Labor and Capital. The conferences have served as a medium for the open exchange of opinion, where both sides are fairly represented. Wheelbarrow's criticisms are acute and pithy, and merit a careful perusal. The author unites Old Saxon Simplicity, sincerity of heart, the truthfulness of honesty and warm sympathy for justice and right.

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday, \$3.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
5 Jordan Street,  
Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

or J. WALTER THOMPSON, (Times Building),  
NEW YORK.

In an intelligent review of Max Müller's Introductory Lectures on the "Science of Thought," published by THE OPEN COURT PUBLISHING CO., Mr. Ernst says in the *Boston Beacon*:

"Max Müller's supremely simple theory is hotly disputed, \* \* but it is easily vindicated, provided one is not a dualist on principle. \* \* Max Müller explains with a master's clearness and firmness what has barely been hinted at in these columns. Now, as a matter of fact, half the trouble in life, half the lawsuits in our courts, and most of the quarrels in society arise from the petty fact that men and women, the college graduates not excluded, are not sufficiently acquainted with their own language. They think they know what they say; but until one really knows what one says,—precisely as the hanker uses figures in a cheque,—there will be trouble."

Three Introductory Lectures

## The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;  
2. The Identity of Language and Thought; and  
3. The Simplicity of Thought.  
With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.  
THE OPEN COURT PUBLISHING CO.  
169-175 La Salle Street. Chicago.  
Neatly Bound in Cloth. Price, 75 Cts.

The study of language is of interest to the lawyer as well as the clergyman, the scientist as well as the teacher, and no education is complete without it.  
Max Müller says in this most instructive and interesting book:

"Try to reckon without numbers, whether spoken, written, or otherwise marked, and if you succeed in that, I shall admit that it is possible to reason or reckon without words, and that there is in us such a thing, or such a power or faculty, as reason apart from words. \* \* \*

"People do no longer believe in witches nor in ghosts. But the belief in disembodied thought will die very hard. \* \* \*

"As little as we possess a thing called hunger because we are hungry, do we possess a thing called reason because we are rational. Why, then, should we write it with a Capital R, and make a goddess of Reason and worship her, as she was actually worshipped in the streets of Paris? \* \* \*

OUTLINE STUDIES in Holmes, Bryant, Whittier, etc. mailed. Chas. H. Kerr & Co., Pub's, Chicago.

## MINERVA INSTITUTE,

Day and Boarding School for Girls.

N. E. Cor. Paulina St. & Berceau Ave.,

RAVENSWOOD, ILL.

Preparatory College Course; Foreign Languages taught by native, resident Teachers; fine advantages for Music and Art. Delightful situation; accessible from Chicago by street car (Graceland and Lawrence Aves.) and Chicago & Northwestern R. R.  
For Catalogue and Information address

Mrs. AMALIE ENDE, Prin.,

RAVENSWOOD, ILL.

P. O. Box 383.

# The Open Court.

A WEEKLY JOURNAL

Devoted to the Work of Conciliating Religion with Science.

No. 46. (VOL. II.—20.)

CHICAGO, JULY 12, 1888.

Two Dollars per Year.  
Single Copies, 10 cts.

## TRANSFORMATION AND ADAPTATION IN SCIENTIFIC THOUGHT.\*

AN INAUGURAL ADDRESS DELIVERED UPON ASSUMING THE  
RECTORATE OF THE UNIVERSITY OF PRAGUE,  
ON OCTOBER 18, 1883.

BY ERNST MACH.

*Translated from the German by Mphk.*

### PREFATORY REMARK.

The idea advanced in the following essay is really neither new nor strange. I had myself discussed it cursorily as early as 1867, and have touched upon it several times since; yet it has never formed the subject proper of any disquisition I have written. Undoubtedly others have treated it; the idea lies, so to speak, in the atmosphere. Some of the illustrations which I made use of in the detailed treatment of the subject, have met with favorable recognition, although they were known only in an imperfect form, from the reports of daily papers upon my spoken address. For this reason I decided to publish this essay, which I had not originally intended.

I do not wish, in this matter, to trespass upon the domain of Biology. My statements are to be taken simply as the expression of the fact that no one can escape the influence of a great and far-reaching idea.

It was towards the close of the sixteenth century when Gallileo with a superb indifference to the dialectic arts and sophistic subtleties of the Schoolmen of his time, directed the attention of his brilliant mind to nature and natural phenomena. By nature his ideas were transformed and released from the fetters of contemporary prejudice. At once the mighty revolution was felt, which was therewith effected in the realm of human thought—felt indeed in circles far remote and wholly unrelated to the sphere of Science, felt in strata of society which had hitherto but indirectly recognized the influence of scientific thought.

And how great and how far-reaching was this revolution! From the beginning of the seventeenth century till its close we see arising, at least in embryo, almost all that plays a part in the natural and technical science of our day, almost all that in the two centuries following has so wonderfully transformed the facial appearance of the globe, and all that is moving onward in process of such mighty evolution to-day. And all this, the direct result of Gallilean ideas, the

direct consequence of that freshly awakened sense for the investigation of natural phenomena which taught the Tuscan philosopher to form the concept and the law of falling bodies from the observation of a falling stone! Gallileo began his investigations without an implement worthy of the name; he measured time in the most primitive way, by the dropping of water. Yet soon afterwards the telescope, the microscope, the barometer, the thermometer, the air-pump, the steam-engine, the pendulum and the electrical machine were invented in quick succession. The fundamental theorems of Dynamical Science, of Optics, of Heat and of Electricity were all disclosed in the century that follows Gallileo.

The movement that was instituted by the illustrious biologists of the last one hundred years and then called into life by the late Mr. Darwin, is of scarcely less importance. Gallileo quickened the sense for the simpler phases of *inorganic* nature. And with the same simplicity and frankness that marked the efforts of Gallileo, and without the aid of technical or scientific instruments, without physical or chemical experiment, but solely by the power of thought and observation, Darwin grasps a new property of *organic* Nature—the PLASTICITY of living substance.\* With the same directness of purpose, Darwin too pursues his way. With the same candor and love of truth, Darwin too points out the strength and the weakness of his demonstrations. With masterly equanimity he holds aloof from the discussion of irrelevant subjects and he thus wins the admiration of his adherents and commands the respect of his adversaries.

Thirty years have not yet elapsed since Darwin first propounded the principles of his Theory of Evolution. Yet we already see his ideas becoming firmly

\* At first sight an apparent contradiction arises from the admission of both heredity and adaptation; and it is certainly true that a strong disposition to heredity precludes any great capability of adaptation. But imagine the organism to be like a plastic mass which retains the form transmitted and gives it by former influences until new influences modify it; the one property of *plasticity* will thus be seen to represent capability of adaptation as well as of hereditary transmission. Analogous to this is the case of a bar of magnetized steel of high coercitive power; the steel retains its magnetic properties until a new force displaces the same. Take also a body in motion; the body retains the velocity acquired in (*inherited* from) the interval of time just preceding; unless the same be changed in the next moment by some accelerating force. In the case of the body in motion the change of velocity (*Abänderung*) was looked upon as a matter of course, while the discovery of the principle of *inertia* (or persistency) created surprise; in Darwin's case, on the contrary, *heredity* (or persistency) was taken for granted, while the principle of *modification* (*Abänderung*) appeared novel.

\* Translation copyrighted.

lodged in every branch, however remote, of human thought. Everywhere, in history, in philosophy, even in the physical sciences, we hear the watchwords: heredity, adaptation, selection. We speak of the struggle for existence among the heavenly bodies and of the struggle for existence in the world of molecules.

The impetus given by Galileo to scientific thought was marked in every direction; thus, his pupil, Borelli founded the school of exact medicine from whence proceeded, even, distinguished mathematicians. And now Darwinian ideas are similarly animating all provinces of investigation. It is true, nature is not made up of two distinct parts, the inorganic and the organic; nor must these two divisions be treated perforce by totally distinct methods. But nature has many *phases*. Nature is like a thread in an intricate tangle, which must be followed and traced, now from this point and now from that. But we must never fancy, as physiologists have been taught to do by Faraday and J. R. Mayer in a more circumscribed province, that progress in paths once entered upon, is the *sole* condition of enlightenment.

It will devolve upon the specialists of the future to determine the relative stability and productiveness of Darwinian ideas in their several provinces of investigation. But upon this occasion I propose simply to discuss and consider the growth of our knowledge of nature in the light of the theory of evolution. For *knowledge is an expression of organic nature*. (Ideas have thus the properties of living organisms.) And although ideas, as such, can not be treated in every respect as separate and distinct individuals (*gesonderte Lebewesen*), and although every forced comparison is to be avoided, yet, if Darwin has comprehended the true nature of things, the common trend of evolution and transformation is necessarily manifested in ideas also.

I shall here waive the consideration of the fruitful topic of the transmission of ideas or rather the transmission of the aptitude for certain ideas. Nor would it come within my province to discuss psychic evolution in any form, as Spencer and many other Zoo-psychologists have done with more or less success. I shall not enter into a discussion of the struggle for existence and of natural selection among scientific theories. We shall consider here only such processes of transformation as every student can easily observe at work in his own mind.

\* \* \*

The Child of the Forest discovers and follows the trail of the chase with marvellous acuteness. He outwits and overreaches his foes with surpassing cunning. He is perfectly at ease and firmly situated in the sphere of his peculiar experience. But confront him with an unwonted phenomenon; place him face to face with a technical product of modern civiliza-

tion, and he will lapse into impotency and helplessness. Here are facts which he does not comprehend. If he endeavors to grasp their meaning, he misinterprets them. He fancies the moon, when eclipsed, to be tormented by an evil spirit. To his mind a puffing locomotive is a living monster. The letter accompanying a commission with which he is entrusted, having once revealed his thievishness, is in his imagination a conscious being, and he must hide it under a stone, before venturing to commit a fresh trespass. Arithmetic appears to him like the art of the geomancers in the Arabian Nights,—an art which is able to accomplish every imaginable impossibility. And, like Voltaire's "*ingénu*," when placed amid the complexities of our social institutions, he plays, in our opinion, the maddest of pranks.

With the man who has made the achievements of modern science and civilization his own, the case is quite different. He sees the moon pass temporarily into the shadow cast by the earth. He feels in his thoughts the water growing hot in the boiler of the locomotive; he feels also the increase of tension which pushes the piston forward. Where he is not able to trace the direct sequence of things he has recourse to his rule and table of logarithms, which aid and facilitate his thought without predominating over it. Such opinions as he may not concur in, are at any rate known to him, and he understands how to meet in argument those who advance them.

Now, wherein does the difference between these two men consist? The train of thought habitually employed by the first one does not correspond to the facts that he sees. He is surprised and nonplused at every step. But the thoughts of the second man follow events and anticipate them; his thoughts have become adapted and adjusted to the larger field of observation and activity in which he is located; he conceives things as they are. The Indian's sphere of experience, however, is quite different; his bodily organs of sense are in constant activity; he is ever intensely alert and on the watch for his foes; or, his entire attention, and energy, is engaged in procuring sustenance. Now, how can such a creature project his mind into futurity, foresee or prophesy? This is not possible until our fellow-beings have partly relieved us of our concern for existence. It is then that we acquire freedom for observation, and not infrequently too that narrowness of thought which society helps and teaches us to disregard.

If we move for a time, within a fixed circle of phenomena which recur with unvarying uniformity, our thoughts adapt themselves in time to our environment; our ideas unconsciously become the reflex and counterpart of our surroundings. The stone we hold in our hand, when dropped, not only falls to

the ground in reality; it also falls in our thoughts. Iron-filings dart towards a magnet in imagination as well as in fact, and, when thrown into a fire, they grow hot in conception as well.

The impulse to complete mentally a phenomenon which has been but imperfectly observed, has not its origin in the phenomenon itself; of this fact, we are fully sensible. And we well know that it does not lie within the sphere of our volition. It seems to confront us rather as a power and a law imposed from without and controlling both thought and event.

The fact that we are able by the help of this law to prophesy and forecast, merely proves a sameness or uniformity of environment competent to effect a mental adaptation of this kind. The necessity of fulfilment, however, is not contained in this compulsory principle which controls our thoughts; nor is it in any way determined by the possibility of prediction. We are always obliged, in fact, to await the completion of what has been predicted. While errors and departures are constantly discernible, being slight only in provinces of such rigid constancy as for example Astronomy.

In instances where our thoughts follow the connection of events with ease, and in instances where we positively forefeel the course of a phenomenon, it is natural to fancy that the latter is determined by and proceeds perforce in conformity with our thoughts. But the belief in that mysterious agency, termed *causality*, which holds in unison thought and event, is violently shaken when a person first enters a province of inquiry in which he has hitherto had no experience. Take for instance the strange interaction of electric currents and the phenomena of electro-magnets, which seem to defy all the resources of mechanical science. Let him be confronted with such phenomena and he will immediately feel himself forsaken by his power of prediction; he will bring nothing with him into this strange field of events but the hope of soon being able to adapt his thoughts and ideas to the new conditions there presented.

A person constructs from a bone the remaining anatomy of an animal; or from the visible part of a half concealed wing of a butterfly he infers and re-constructs the part actually concealed. He does so with a feeling of highest confidence in the accuracy of his results; and in these processes we find nothing preternatural or transcendent. But when physicists adapt their thoughts and adjust their ideas in conformity with the course of events as to motion and time, we invariably surround their investigations with a metaphysical halo; yet these latter adaptations bear quite the same character as the former, and our only reason for investing them with a metaphysical

garment, perhaps, is the high practical value of the results obtained.

Let us consider for a moment what takes place when the field of observation to which our ideas have been adapted and now conform, becomes enlarged. We had always seen heavy bodies sink, when their support was taken away; we had also seen, perhaps, that heavier bodies descending, force lighter bodies upward. But now, we see a lever in action, and we are suddenly struck with the fact that a lighter body is lifting another of much heavier weight. Our customary train of thought demands its rights; the new and unwonted event likewise demands its rights. From this conflict between thought and event the *problem* issues; from this partial contradiction arises the question "why." By a subsequent adaptation to the enlarged field of observation, the problem disappears, or in other words it is solved. In the instance cited, we must adopt the habit of always considering the amount of mechanical work performed.

The child just awakening into consciousness of the world, knows no problem. The bright flower, the ringing bell, are all new to it; and yet it is surprised at nothing. The out and out Philistine, whose only thoughts lie in the beaten path of his every-day pursuits, likewise has no problems. Everything goes its wonted course, and if perchance a thing go wrong at times, it is at the most a mere object of curiosity and not worth serious consideration. In fact, the question "why" has lost all warrant in relations where we are familiar with every aspect of events. But the capable and talented young man has his head full of problems; he has acquired, to a greater or less degree, a certain habit of thought, and at the same time he is constantly observing what is new and unwonted, and in his case there is no end to the questions "why."

Thus, the factor which most promotes the progress of scientific thought is the gradual enlargement of our field of experience. We scarcely notice events we are accustomed to; the latter do not really acquire an intellectual significance until placed in contrast with something to which we are unaccustomed. Things that at home are passed by unnoticed, delight us when abroad, though they may appear in forms but slightly different. The sun shines with increased radiance, the flowers bloom in brighter colors, our fellow-men accost us with lighter and happier looks. And, returning home, we find the old familiar scenes even more inspiring and suggestive than before.

Every motive that prompts and stimulates us to modify and transform our thoughts, proceeds from what is new, uncommon and not understood. Novelty excites wonder in persons whose fixed habits of thought are shaken and disarranged by what they see. But the element of wonder never lies in the phenom-

enon or event observed; it is to be sought in the person observing. People of the more vigorous mental type aim at once at an *adaptation of thought* which will conform to what they have observed. Thus does Science eventually become the natural foe of the wonderful. The sources of the marvellous are unveiled, and surprise gives way to calm interpretation.

(To be concluded.)

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M. D.

Part XI.

##### HEREDITARY INFLUENCES.

The doctrine of heredity has proved a potent ally of Monism. For, the last four hundred years the progress of mankind has been a fact demonstrated by such unmistakable evidence that the clerical opposition to the principles of the Darwinian hypothesis seemed a rather gratuitous caprice of bigotry. But the truth is that the progressive development of the human race was long thought compatible with the scriptural myth of creation. Civilization was considered a mere outcome of accumulating stores of knowledge, aided perhaps by supernatural interference in favor of orthodox nations, but wholly independent of any general process of organic evolution. The Port Royalists, for instance, distinctly acknowledged the predestined advance of the human race to higher and higher planes of culture, yet withal denied any analogous tendency in the organic constitution of animals, which, indeed, they treated as mere machines, acting upon established and invariable motives of "instinct." The progress from social barbarism to civilization was ascribed exclusively to well-directed educational influences.

The Darwinian theory, however, added a new factor of evolution: The heredity of individual attainments, in other words, the purely physical transmission of moral and mental characteristics, thus subjecting the phenomena of mind to the general laws of animal physiology. In the principles of the "Origin of Species," the exponents of the established creed therefore instinctively recognized the doom of Dualism.

Yet those principles became more and more clearly identified with a universal law of Nature. "If the true theory should ever be announced," says Emerson, "we shall know it by this token: that it will solve many riddles," and the doctrine of evolution by heredity furnished a clew to the solution of enigmas which no other key would unlock.

If animals are a mere variety of marionettes, which "know nothing, desire nothing, and perform their functions in obedience to a blind and automatic con-

trivance of his organism,"\* how shall we explain the indisputable fact that they profit by experience and that the mental modifications of individuals reappear in their progeny? Or, if a child's mind (as even Locke maintained) is a mere *tabula rasa*, a blank leaf, to be inscribed with the records of personal experience and the lessons of education, how is it that, *in spite of education*, the character traits and intellectual tendencies of fathers will reassert themselves in his sons, in sons trained perhaps in the homes of strangers and under social influences totally different from those of their birthland.

The tenet of "primary ideas," or innate beliefs," so long a mere hypothesis of convenience, has been both confirmed and explained by the doctrine of heredity, which makes the mental characteristics of individuals a joint product of personal and ancestral experience. "Primary ideas," in fact, are neither universal nor confined to the sphere of self-evident propositions. Every tribe of the human race, every species of animals, nay, every variety and family of animated beings, may be said to supplement those ideas by hereditary conceptions of their own—conceptions often clearly antedating the possibility of individual experience. The naturalist Spalding tested a private theory of his own by procuring a number of newly-hatched turkeys and depositing them on a piece of carpet in a room where he had secreted a chicken-hawk, apt to resent close confinement by harsh screams. At the first of those screams the little nestlings started to their feet and ran off with every sign of terror, though they could not possibly have known the significance of such sounds from personal experience. Chicks, an hour old, even if hatched by the artificial warmth of an incubator, will follow the call of a mother-hen and toddle off at the approach of a dog or cat. Young wolves, removed from their mother's den during the period of blind infancy and fed by hand for weeks, will nevertheless hush their whining at the approach of footsteps and shrink in terror from the sudden appearance of a human being, though in the next moment the reviving impression of individual experience may overcome the bias of hereditary instinct. In certain cases, though, personal experience fails to counteract the influences of generic tendencies, in other words, hereditary dispositions may assert themselves *in spite of education*. Young beavers permitted to run at large in human dwellings, insist on constructing "dams," by piling up boxes, books, kitchen

\* A theory carried to its extreme consequences in the following characteristic passage: "Dans les chiens, les chats, et les autres animaux, il n'y a ni intelligence ni âme spirituelle comme on l'entend ordinairement. Ils mangent sans plaisir; ils crient sans douleur; ils croissent sans le savoir; ils ne désirent rien; ils ne connaissent rien; et s'ils agissent avec adresse et d'une manière qui marque un trait d'intelligence, c'est que Dieu les a fait (pour les conserver), de telle manière qu'ils évitent, sans le savoir, tout ce qui peut les détruire et qu'ils semblent craindre."—Malebranche: *Méditations Métaphysiques* (1689).

utensils or anything they can move or reduce to a portable condition. They will gnaw off table-legs and drag them along to fortify the walls of their dike, they will rip open mattresses to appropriate bundles of horse-hair, and the frequent demolition of his fabrics will not in the least discourage the constructive enthusiasm of the little architect. No punishment will deter a pet marmot from purloining handkerchiefs and newspapers, and even in the superheated atmosphere of a kitchen he will collect warm bedding-material as if his life depended upon the chance of counteracting the rigors of an Alpine climate. An exactly analogous after-effect of ancestral experience often inspires the penurious monomanias of wealthy misers. In religious liberalism and cosmopolitan tendencies they may have far outgrown the standpoints of their narrow-minded parents, but the deep-rooted habit of economy obstinately resists the modifying influences of new surroundings. They may risk large sums in commercial speculations and disregard expenses in securing the ablest managers of their industrial enterprises, but in their private habits inherited principles prevail, and I know a mill-owner who buys his corn by the train-load and secures the best machinery, regardless of cost, but who nevertheless will wait for half-hours on the platform of a freight-depot in the hope of saving the price of a ticket by joining a gang of laborers in the caboose of a construction-train. He will prowls about the premises of a tobacco-factory to fill his pocket with the gleanings of the rubbish-heaps, and has been known to rummage the waste-baskets of his clerks in the hope of discovering an uncanceled postage-stamp.

The employées of tyrannous masters are apt to seek compensation by tyrannizing their families, and that penchant for an overbearing treatment of subordinates often develops an hereditary habit which explains the aversion of soldiers, sailors, etc., to the discipline of officers promoted from the ranks. "Put a beggar on a horse and he will ride it to death," says an old Irish proverb, and the most inhuman taskmasters of our southern plantation negroes were slaves entrusted with the authority of an overseer. A journalist who investigated the compensation and the habits of London factory-operatives reports that the women employed in two of the largest shirt-factories get only from 10 to 15 shillings a week, but adds that they "prefer the minimum rate to the alternative of having to work under a female overseer, the male taskmasters being so much less despotic." In spite of their intense race-prejudices, Russian soldiers, for similar reasons, prefer foreign officers to their own countrymen, who reconcile their obsequious deference to the caprices of a superior with an arbitrary absolutism in the treatment of their inferiors. "Del Rey

y de la Inquisition calle la Boca," says an old Spanish proverb: "Don't discuss politics and religion." A similar aversion to religious topics of conversation still characterizes our Hebrew fellow-citizens whose forefathers were so often victimized by inquisitorial spies in the guise of freethinkers. Intellectual habits are hereditary to a degree which we rarely realize in this age of universal education. The Intuitionists who believed in the spontaneous development of certain "primary ideas," would be tempted to consider the intuitive recognition of manifold moral and mental axioms a common heirloom of the human race, but might be undeceived in the mission-schools of Africa and Eastern South America. The geometrical principle that "things which are equal to the same thing, are equal to one another," may appear self-evident to the mind of a Caucasian schoolboy, but would require numerous experiments to illustrate even its meaning to the mental apparatus of a juvenile Hottentot. The traveler Burmeister found it difficult to get his Indian page to remember the number of his saddlebags, whenever that number happened to deviate from the exact standard of ten (a quantity internationally familiarized by the decimal arrangement of fingers and toes), and if we shall believe La Condamine, the Yancos of the upper Amazon get hazy in their calculation whenever a sum or product exceeds the maximum of *three*, a number which their vernacular can express only by the paraphrase of *Poettarrorincoar-rac*—"first one and then another and one more."

Experienced teachers notice a difference in the intellectual capacity, not only of different races, but even of the different social subdivisions of the same races and communities. City boys, for instance, are as a rule far more mischievous and mutinous than peasant lads, but in spite of their habitual inattention, they comprehend the axioms of their textbooks with a readiness almost incomprehensible to their rustic schoolmates.

The foreign teachers of our Catholic parish-schools often complain that "American children have so little ear for music," while American workmasters are frequently surprised by the want of mechanical aptitude in a foreign apprentice of otherwise more than average versatility and intelligence. A modicum of ancestral experience aids the attainment of almost every form of accomplishment. New methods of instruction, new doctrines, and even the introduction of new machinery, at first seem to impede the currents of mental habits wont to move in different channels of routine.

"When states of mind, in no respect innate or instinctive," says Stuart Mill, have been frequently repeated, the mind seems to acquire a greatly increased facility of passing into those states; and this increased facility must be owing to some change of a physical

character in the organic constitution of the brain. There is also considerable evidence that such modification can in many cases be transmitted, more or less completely, by inheritance."

Hence also he often repeated experience of reformers and scientific discoverers, who for a fair recognition of their merits have to appeal to the "verdict of posterity," i. e., to the judgment of a generation trained in modes of thought which their forefathers were forced to respect, but declined to adopt.

New truth may be the fruit of laborious research; but less easy to explain is the occasional discovery, as if by intuition, of new facts, or the attainment of phenomenal accomplishments, clearly transcending the range of ancestral experience. The theory of the hereditary origin of intuitions would in such cases seem to be at fault, if the influence of parentage were not occasionally apt to transmit a favorable combination of mental gifts derived from a *double line of ancestors*, as for instance special aptitudes (direction) from the mother's side and unusual mental energy (force) from the father's. How far in such exceptional cases intuitions may surpass the usual results of education is strikingly illustrated by the case of the American peasant boy, Zerah Colburn, who at the early age of eight years began to surprise the arithmeticians of his native village by his feats in the solution of numerical problems. He would repeat the products of five or six different numbers, extract square and cube roots when they wanted him to dig potatoes, or estimate the number of cubic inches of water in the basin of every wayside pond. His monomania at last assumed dimensions that attracted the attention of outsiders, and in 1812, before the completion of his ninth year, he was taken to London, where the mathematician Baily (who at first had doubted the truth of the phenomenal reports) examined him in the presence of several equally skeptical colleagues, with the following results: "He raised any number consisting of one figure progressively to the *tenth* power; giving the results (by actual multiplication, and not by memory) faster than they could be set down in figures by the person appointed to record them. He raised the number 8 successively to the *sixteenth* power; and in naming the last result, which consisted of fifteen figures, he was right in every one. On being asked the square root of 106,929, he answered 327, *before the original number could be written down*. He was then required to find the cube root of 268,336,125; and with equal facility and promptness he replied 645. He was asked how many minutes there are in forty-eight years; and before the question could be written down he replied 25,228,800, and immediately afterwards gave the correct number of seconds.

On being requested to give the factors which would

produce the number 247,483, he immediately named 941 and 263, which are *the only two* numbers from the multiplication of which it would result. On 171,395 being proposed he named  $5 \times 34,279$  and  $83 \times 2065$ . He was then asked to give the factors of 36,083, but immediately replied that it had none, which is really the case, this being a prime number. The number 4,294,967,297 having been given to him, he discovered (as Euler had previously done) that it is not the prime number which Fermat had supposed it to be, but that it is the product of the factors  $6,700,417 \times 641$ .

On being asked to name the square of 999,999 he obtained the amazing result (999,998,000,001) by twice multiplying the square of 37,037 by 27. He then of his own accord multiplied that product by 49, and said that the result (*viz.*, 48,999,902,000,049) was equal to the square of 48,999,951. In the extraction of roots and in the discovery of factors of large numbers, he immediately, or in a very few seconds, gave answers which, according to the ordinary methods, would have required very difficult and laborious calculation (even with the aid of logarithms), while prime numbers cannot be recognized as such by any known rule."

It is a significant circumstance that a prodigy of that special type was evolved in a land of commercial activity and mental arithmeticians, just as the infant virtuoso Mozart was born in a land of music, and the boy poet Goethe in the home of the Minnesingers.

#### PLANTATION FOLK-LORE.

BY L. J. VANCE.

(Continued.)

The story of "De King an eh Ring" (No. XXXI) has found its way into a good many collection of folk-tales; an abridged account of which may be given as follows: Once upon a time a King had three servants, of whom one stole his ring. After trying in vain to discover the thief, the King called in the services of a "conjurer man," who promised to get the ring back within five days; if the conjurer failed he was to lose his head. Four days passed and the 'conjurer man' had made no progress towards finding out the thief. On the morning of the fifth day he first charged one of the servants with the robbery, also the second, and then the third servant. That evening all three came to him and confessed, and begged the 'conjurer man' to clear them from suspicion. He told them to bring a turkey-gobbler. "Eh tek de Ring an eh mix um long corn-flour, an eh poke em een de tukrey-gobbler craw. Den eh mark de bud (bird) so him kin know um gen." He of course tells the King that the ring is in the gobbler, and lo! when the bird was cut open, "sho nuff, was de Ring." The same story may be found in Grimm (No. 98); in Dasent's "Popular Tales from the Norse" of P. Asbjørnsen, Second Series;" "The Charcoal

Burner; in Caballero, "Cuentos," p. 68; in "The Orient and Occident," Vol. I, p. 374; in Crane's "Italian Popular Tales," "Crab," p. 314. The story is evidently of Oriental origin, as would appear from Benfrey's account, *Pantschontautra*, Leipzig, 1859. Erster Theil, p. 374.

No. XXXII, "Buh Lion, Buh Rabbit, Buh Fox, an Buh Rocoon," is one of those stories which like the course of empire westward takes its way. Whether it crossed the Atlantic in first cabin, in steerage, or in slave chains, we do not know. The first time that we came across it was, when with lexicon in one hand and with the Greek text in the other, we laboriously translated from the interesting and lively pages of Herodotus the story of the Treasures of the Egyptian King Rhampsinitos. Many of us are familiar with the story told by Pausanias of the two architects, Agamedes and Trophonius, who built the treasury of Hyricus; how they knew the secret opening by which one of them could enter and plunder the King's vaults; how they did so until the King set a trap for the robbers; how one of them was entrapped, and his head cut off by his companion so that the body might not be recognized; how the King ordered that the corpse be taken through the streets, and that any person found making any sign of grief should be arrested; how the body was taken to the scaffold by the soldiers, who, becoming intoxicated, allowed the corpse to be taken away; how, finally, the King in his admiration for cunning and ingenuity gave his daughter to the other thief. Now, just change the name of the King into Buh Lion, and the names of the two thieves into Buh Coon and Buh Fox—there you have the whole negro story. For parallels we may cite the Hindu legend of Karpas and Gata (see Cox's "Mythology of the Aryan Nations," vol. I, chap. VIII); the Highland story of 'The Shifty Lad' (Campbell's "Tales of the West Highlands"); the Sicilian story of "The Mason and His Son," (Crane's "Italian Popular Tales," page 163). For other references, see Ralston's Introduction to Schieffner's "Tibetan Tales," page XLVII. There is also an Italian book on *La Leggenda del Tesoro di Rampsinite*, which we have not seen.

One of the incidents in No. XXXIII ("Buh Rabbit, Buh Wolf an de Porpus") tells about a pulling match between the Wolf and the Porpus. The Rabbit says: "Leh we hab some fun, an see who kin pull de strongis; Buh Porpus genst me an Buh Wolf." So he takes a long grape vine and ties one end of it round the Porpus's head, and the other end he fastens round the Wolf's body. As the Rabbit gives the word to 'pull,' he himself slips out of the vine. The Porpus dives down and, of course, pulls Buh Wolf after him, "an drown um." In "Uncle Remus," the contest is between Brer Terrapin and Brer Bear. The wily

Terrapin dives down and fastens his end of Miss Meadow's bed-cord to a big root. The Bear soon gives up pulling against such an antagonist. (No. XXVI, p. III: "Mr. Terrapin Shows His Strength.") In Prof. Hartt's "Amazonian Tortoise Myths," ("How the Tortoise provoked a contest of strength between the Tapir and the Whale," page 20), the Tortoise ties one end of a long root to the Tapir and the other to the Whale; the two, ignorant of the Tortoise's doing, pull away until they give up exhausted. See also a version in Mr. Smith's "Brazil, The Amazons," etc., p. 545.

No. XXXIV, "De Debble an May Belle," belongs to the "Bluebeard" class of popular stories. A story of this class usually tells of two sisters who are married in turn and killed by their husband, because they open the forbidden chamber. The third, or youngest sister, although she opens the forbidden door, manages to escape and restores her dead sisters to life. In the negro story, "de Debble," dressed up as a fine gentleman, comes to woo May Belle, who marries him and is taken to a splendid house. Of course, she looks into the closet and sees "tree nong ooman duh heng up long dem neck." As the story must be familiar with every reader, we forbear to give any further details. See versions by Grimm of "The Feather Bird," and "The Robber Bridegroom," etc., etc.

But there is one incident in the negro story which cannot be passed over. When May Belle is ready to run away, the horse tells her to take "four big nails wuh day on de mantle-piece een de Debble room." The Devil starts in hot pursuit after May Belle who drops one of the nails in the road, "an right off one big bank er san riz up clean cross de road. Wen night come on dem drap anrurr nail, middle night anrurr, an es de sun duh rise dem drap de las one. Ebry time de nail drap, de big bank er san rise up an shet up de road." These incidents of the magic flight and magic obstacles are so numerous in *Märchen* all over the world, that they have been made subject of special study by folk-lorists. See *Scribner's Magazine* for June, 1887. Mr. Lang's, "Custom and Myth," page 92; Prof. Crane's "Italian Popular Tales," note 11 to chap. II, page 335. Among some of the incidents are: the throwing behind of a comb which changes into a thicket; the throwing behind of three balls of yarn which become in turn a mountain, a mountain covered with sharp nails, and a mighty torrent (Sicilian version); the casting behind of a black-head dress which is turned into grapes, of a close-toothed comb which is turned into bamboo sprouts, (Japanese version). Several Zulu versions may be found in Callaway's Zulu tales; in Ralston's Russian tales; in Campbell's West Highland tales. The writer in *Scribner's Magazine* cites a modern variant current among the American Indians.

Nor can the opening paragraph of this story of "De Debble an May Belle" be passed over. The paragraph is as follows: "De Debble, him kin tek all sorter shape fuh cahr out him plan an fool people. Sometime eh mek isselt inter wolf fuh kill you sheep. Narruh time eh tek de shape er alligator fuh worry you duck an goose. Den eh look lucker white deer, an eh fly tru de wood, dout mek no noise, fuh skade people duh walk long de big road. Den eh come same lucker Owl, an eh holler down you chimblly an eh tariffy ebrhybody wen dem duh tun flour een de pot. Den wen you sick, eh gone censerider you lucker a wurrum, an eh gie you all sorter misry. Den gen, eh kin tek de shape er man, en pass isselt off fur great gentleman long de lady." (P. 82.) Now, we have called attention to this description, because the negro attributes the same powers to the Devil that savages ascribe to the "Medicine-Man." According to Dr. Bleek the Bushmen believe that their sorcerers "assume the form of beasts and jackals." Among the Mayas of Central America, sorcerers could "transform themselves into dogs, pigs and other animals; their glance was death to a victim." Indeed, the belief in transformation of sorcerers into animals, and their power to work harm under such a guise is practically universal among savages who have attained no higher degree of culture than myth-making negroes. The belief, as Mr. Lang and Mr. Taylor have shown, is the natural result of savage ideas.\*

The next negro story that we take is that of "De ole man an de Coon." (No. XXXV.) The story is about an "ole nigger bin know ebryingt bout ebryingt." His master makes a wager with one of his guests that the latter need not ask his smart servant any question, but that the "ole nigger" would answer it correctly. The guest gets a coon, has it headed up tightly in a barrel, and after sending for the "ole nigger" asks what is in the inside. He inspects the barrel, and finally seeing that he must fail to answer correctly, says: "Mossa, hoon (you) done head de ole coon dis time." At this happy hit out of his perplexity, the company break out into a laugh, "an gie de ole man big praise." If any one wishes to see how such an incident may be used by a modern novelist, let him read Charles Reade's "Born to Good Luck," in *Harper's Magazine*, July, 1883. By the way, Patrick O'Rafferty in Reade's Irish Story goes through nearly the same adventures that the "charcoal-burner" does in the Norse Story. (See Dasent's translation of Asbjörnsen's *Ny Samling*; second series, p. 139).

In addition to parallels already noted as common to "Negro Myths" and Uncle Remus," we call attention to the following: No. XXXIX, "Buh Rabbit, Buh Wolf, an de Holler Tree"; No. XLI, "Buh Rabbit,

Buh Fox, an de Fisherman"; No. XLIII, "Buh Rabbit, Buh Wolf, De Dog, an de Goose"; and No. L, "Buh Roccoon an Buh Possum"—these all contain incidents more or less similar to stories told by Uncle Remus.

Finally, we direct attention to No. LVI, "De ole King and de Noug King." The frame-work of this story is of Oriental origin. The negro narrator makes no pretense of adapting the story to local color and scenery, but he has simply followed the authorized version found current among many Western Folk. The same applies to the story of "De Fiddler, Buh Tiger, an Buh Bear" (No. LV). This Fable, although not of Oriental origin, came from the East, and has finally found its way into a collection of "Negro Myths."

Yet one word as to the form of these Negro Fables. The early animal stories were doubtless without any point or moral. But in hands of Æsop and his successors the fable has come to have a twofold purpose—amusement and instruction. As Phædrus, the well-known and direct successor of Æsop, puts it:

*"Duplex libelli dos est: quod risum movet,  
Et quod prudenti vitam consilio monet."*

Thus it comes about that the fable-making negro is quite a philosopher in a homely fashion. Some of the morals appended to these negro fables are full of wit and wisdom. Thus "de man wuh trus in esselt," says Daddy Sanday, "guine fail: wile dem dat wait topper de Lord will had perwision mek fur um." Again, "People wuh wunt mek up dem mine in time dem mean fuh do guine git left." Once more, "Eh fine eh yent deman wid de bigges belly wuh kin eat de longes." Old Daddy Smarts' advice is, "When ebbey you farruh (father) gie anything, tek um, an tenky; you suttently will fine out dat wuh eh gie you will do you no harm, but eh will fetch good luck ter you." The parable of the Fowl-Hawk who "Lord er no lord, manage fuh fine all him want fuh eat," has a good deal of the flavor of the darky's sense of rewards and punishments in this skeptical world.

Here we conclude, having traced parallels to "Negro Myths" almost all over the world, "even among barbarians." We have seen that some of the stories told by Uncle Remus and by Daddy Jack were heard by Prof. Hartt and by Mr. Smith on the Amazons. We have found Negro Myths that turned out after all to be only European *Märchen* in dark disguise. We have noted negro fables that take us back to the reign of the Egyptian King Ramsinots. We have seen that a fable in the mouth of a Negro or a Norse Peasant may become a well-written novel in the hands of a Charles Reade.\* Lastly, we have found that Negro,

\* Myth, Ritual and Religion, vol. 2, p. 119.

\* Both Miss Thackeray and Dr. Weir Mitchell have used incidents of folk stories in their novels.

Hottentot, Greek, and Hindoo peasant are all in a tale. Surely to those who read between the lines all these things have more than a surface meaning.

Now, the chief problems raised by these Negro Myths and *Märchen* are: (1) What is the origin of fables and folk stories? (2) Where was the home, or centre from which they originally started? (3) How is it, that they so closely resemble each other in plot and arrangement and are so widely diffused all over the globe?

As to the first question we have already made plain what our answer might be. Holding (with Mr. Lang) that the presence of talking and rational beasts, and the occurrence of metamorphosis and magic in the *Märchen* as well as in the higher myths were evolved out of the same condition of human fancy, we can in a measure understand why animal stories should be so much in vogue among the simple, untutored plantation negroes. Again, we have ventured to dissent from the theory that *Märchen* are exclusively Aryan, or that they arose from a "disease of language." So too, we have given reasons for objecting to the theory, that *Märchen* are the *detritus* or youngest and latest form of Myths. On the contrary, many negro and European *Märchen* carry us back to a time when man was not human, but savage. For the absurd, the strange, or the miraculous the modern European *Märchen* may well hold its place beside Hottentot or any other mythology. Our negro tales would seem to stand midway between the Myths of early civilizations and the stories of the modern European, Asiatic, and Indian peasantry. Yet, in default of material, it is not necessary to pass upon the *origin* of popular tales. But, of a negro myth, I am more and more inclined to say that it is.

"A history of departed things,  
Or a mere fiction of what never was."

Hence, from this point of view, negro fables and folk-lore is only interesting as further evidence of the evolution of modern culture from the beliefs and usages of simple-minded folk.

But it may be asked, where did fables and stories, such as we find among the Southern negroes, start? There is much to be said in support of Theodore Benfrey's theory that popular tales were brought into Europe within historical times from India, by oral transmission and literary vehicles, such as translations of Oriental story-books.\* Yet the theory fails to account for those *Märchen*, or popular tales, which are older than historic India, and which, when found among such distant peoples as the Japanese, Scotch, Zulus, Australians,† and North American Indians,

could hardly have travelled from *historic* India. Thus, Mr. Lang has taken the Egyptian tale of 'The Two Brothers,' written down on a papyrus in the time of Rameses II, and has shown that it has points in common with *Märchen* from Hungary, Russia, France, Norway, Serbia, Hesse, etc. He has broken this Egyptian tale into fourteen different incidents, or story atoms, each one of which has parallels in the popular tales of many countries.

We now reach the third and really important problem. How have *Märchen* been so widely diffused all over the globe? What was the time and the method of their transmission? These are the questions put by the Sphinx of popular tales. We may agree with Prof. Crane that the stories found in the Southern States and in Brazil were brought over from Africa by slaves. Yet, this only set the difficulty back a step farther. Where did the negroes in Africa get their fables and *Märchen*? We can hardly suppose that they borrowed *all* of their tales from European settlers. On the other hand, there can be but little doubt that some of the "Negro Myths" in Mr. Jones's volume were borrowed recently from the whites.\* Thus the obscurity in which the origin and diffusion of negro and all other *Märchen* are hidden seems to be inevitable. We only know that no definite bounds can be set to the popular story. The travels of the Wandering Jew are nothing as compared with the migrations of *Märchen* over sea and land, from continent to continent. "What remains to do is," says Mr. Lang, "to confess our ignorance of the original centre of the *Märchen* and inability to decide dogmatically which stories must have been invented only once for all, and which may have come together by the mere blending of the universal elements of imagination. It is only certain that no limit can be put to a story's power of flight *per ora virum*. It may wander wherever merchants wander, wherever captives are dragged, wherever slaves are sold, wherever the custom of exogamy commands the choice of alien wives. Thus the story flits through the whole race and over the whole world."

Finally, we cannot take leave of this volume of "Negro Myths" without saying that the author has shown himself "a master in the difficult art of collecting popular tales." It is now seven and fifty years since Carlyle asked, "Where are now Our People's Books!" Thanks to patient and diligent folk-lorists like Mr. Jones, the question is now in a fair way of being answered.

#### CLASSICAL AND ROMANTIC ART.

Many Scientists and, to a great extent, also business people look upon art and poetry with a certain contempt. There are even philosophers who have no

\*See *The Disciplina Clericalis*; *The Gesta Romanorum*; *The Seven Wise Masters*, etc., etc.

†The various translations of the *Pantschatantra* are given in Max Müller's "Chips," Vol. IV, page 165.

\*The stories of "De New Nigger an 'ch Mossa" and "De Single Ball" (No. XLIX) are modern inventions or yarns.

room for art in their systems or consider it as useless play—as a sport which properly should not exist, as it does not serve any real purpose.

This view of the subject is entirely erroneous and does not agree with the facts of real life. Art, and especially poetry, serve a real and good purpose in life, and are, almost as much as religious impulses, exceedingly strong. Religious sentiment induces men to sacrifice their lives for an idea, and poetical enthusiasm in extraordinary cases lacks very little of attaining a similar power.

Religion and patriotism have no better ally than poetry. When the Spartans waged a luckless war with the Messenians, they sent to the oracle at Delphi and requested help from their patron God, the God of light and of poetry. Apollo sent from Athens a lame school-master as the legend tells. But this man of seemingly little promise proved a great power,—for he was poet. Fragments of his verses are still preserved. Especially one of his hexameters was handed down to this day.

τηδ' ἀνέμειναι γὰρ καλὸν ἐν προμήχουσιν πεισθαι.

'Tis sweet to die in battle front  
For fatherland and home.

This verse has been repeated in Latin by Horace:

Dulce et decorum est  
Pro patria mori.

By the way, the Roman poet did not act accordingly. When in battle he preferred life to the sweetness of a patriotic death and ran away in order not to fight another day, but soon afterwards to join peacefully the victorious party.

The famous verse of Tyrtæus became the leading motto of all the patriotic battle hymns in later ages, which inspired thousands and hundred thousands of warriors to sacrifice their lives for their country. To a great extent the sacrifices must be accounted for by a love of home and freedom. But these sentiments, no doubt, were often kindled by the glowing flame of poetry.

The influence of poetry in almost all domains of human life can not be doubted. It is the very soul of our emotional aspirations in love, in patriotism, in religion. Poetry possesses a power directive of human passions, which may and often does lead to the elevation of human souls. Poetry is the natural vehicle for ideals. An ideal is a conception or idea of such a state of things as does not yet exist, but the realization of which is fostered in our aspiration. Poetry contains in the crystalized shape of verse certain ideas which appeal to our hearts and stir our emotions as well as our sympathies.

The harmony which obtains in versified speech makes it more impressive, so as to enter more easily into and to remain better fixed in our brains. In this way certain ideas poetically formed and conveyed, may

attain such a wonderful power as to make people stake their lives for their realization, and accordingly it is not strange that poetry was credited with potentialities and qualities that are superhuman.

Poetry in a certain sense is indeed superhuman, although it is not supernatural. The ideas often take hold of the poet, they arise in him and he seems aware of the fact that it is not he who governs them, but that they govern him.

Poetry is a formative power by which the views of whole nations are built up. 'Homer and Hesiod,' as an old verse declares, 'have given Greece her gods.' They shaped the Greek myths and ideals and exercised a decisive influence upon the literature, religion, ethics and politics of their nation. Goethe's and Schiller's poetry told more powerfully on the formation of modern German thought than the works of all scientists and philosophers. Kant's influence on the masses is greatly due to Schiller, who confessed himself a disciple of the great thinker of Königsberg and allowed himself to be swayed by his philosophy.

If poetry is not sound, its influence is harmful. It is a fact that, after Goethe's *Werther* was published and eagerly read in Germany, suicides increased to an annual average never before reached; and this was due to the weakening sentimentality of this one novel, which in spite of many great features is morbid to the root.

Woe to the nation whose poetry is rotten. If poetry has grown immoral, it is the worst symptom of a speedy decay.

Germany's literature was full of promise in a time when her political prospects were extremely poor and almost hopeless. But those who saw more than the outside of things predicted her future glory. The German oak was stripped of her leaves, but the sap was sound and thriving.

There are wonderful prophesies in the German folk-lore legends, of the renewal of the German Empire and the resurrection of Frederic Barbarossa. There are prophetic poems by Rückert, Geibel and others which have been fulfilled beyond expectation almost literally. There is a passage in Heine's works, published in the *Salon*, originally written in French and for the French, in which the German poet tells his friends in France what the German nation will be like, if she should again be provoked to fight for her homes, her liberty and her ideals. If she is roused, Heine said, her energy and warlike spirit will swoop down upon her enemy like a thunderstorm.

The poet is prophetic, not only because the finer nerves of his mind are quicker to understand the signs of his time, but also because his poetry is going to tell on the development of the nation. It is a strange fact, that Schiller's dramas severally forboded the events

of his time. He wrote "*Die Räuber*" characterizing the rebellious spirit of an entire overthrow of society, and the French Revolution ensued. Then he wrote *Fiesco*, which depicted the powerful mind of a princely usurper his daring boldness and final failure and a figure like Napoleon appeared in Europe. But after *Fiesco*, he wrote *Wilhelm Tell*, the drama of national fraternity and liberty, and *Die Jungfrau von Orleans* in which he praises the marvelous delivery of a nation from a foreign yoke. Also these dramas prophetically proclaimed the suppression and the rising of the German nation, her wars in 1813-1815 and even the foundation of the Empire in 1870.

Such verses as:

Seid einig, einig, einig!

and:

So lasst uns sein Ein einig Volk von Brüdern  
In keiner Noth uns trennen und Gefahr.

(Let us unite like brothers, as one nation  
That undivided stands in time of danger.)

exercised an incalculable influence on the German mind, which as long as this influence lasts will keep her strong and healthy and which is of greater import than her bayonets and guns.

Washington Irving has somewhere said that it is easier to fight many battles than produce one national poem. And certainly the procreation of a healthy national literature, impregnated with great ideals and a moral spirit, is the most essential desideratum for the future welfare, growth and progress of our nation. America is famous for her wealth and the American often boasts of it. Wealth is a good thing in good hands but it is a dangerous and doubtful boon in the hands of indeliberate persons, it is certain ruin and poison in the hands of libertines and slaves of passion. More important than wealth is the store of ideas, especially those ideas which are ideals, those which serve to lead us onward on the path of progress.

In art and poetry we meet with different conceptions similar to those in religion and philosophy, although they appear under other names. There are factions and partisans also in the domain of artistic taste, and the most prominent oppositions are the classical and romantic schools. These Whigs and Tories of poetry fight with no less zeal than political parties. The contrast is obvious and striking and you can hear classical and romantic art spoken of everywhere; in music and in painting, in sculpture and in architecture the same opposition is noticeable.

What classical and romantic mean has been interpreted very differently and often correctly, but its relation to philosophy has never been sufficiently explained. Classical, it is commonly said, is that conception of art which takes the Greeks of old as a standard, but the romantic does not acknowledge either their superiority or their taste. Classical au-

thors acknowledge *rule* in the domain of art, romantic authors from a matter of principle banish rules and judge products of art from the *effect* produced. Classical authors on the contrary have often shown a certain contempt for effect and think it below their dignity to stoop to popular taste for the sake of effect. Romanticism had always a hankering after that kind of poetry which is to be met with so frequently in the Romance nations that are prominently good Roman Catholics. Accordingly some literary writers of protestant Germany identified both, declaring that Romanticism is a return or at least the desire of returning to Catholicism. And it is true that many Authors of the Romantic School in Germany turned Roman Catholics. Nevertheless Romanticism has only a kinship to Roman Catholicism, but should not be identified with it. This may be proved by the fact that Victor Hugo the head of the Romantic School in France was bitterly opposed to the Roman Church.

Among classic schools we must carefully distinguish between pseudo-classic and real classic authors. The Greeks must be recognized as that nation who naturally produced the classic taste for poetry as well as art in general. Corneille, Racine and Voltaire under the reign of Louis XIV and Louis XV of France were the first who attempted to establish classical taste in modern poetry. But they must be designated as pseudo-classic; they were imitators of the Greek taste as it had been codified by Aristotle. They did not understand the principle of classic art; they applied Aristotle's rules, but failed to recognize the spirit of Greek poetry.

True classic poetry was produced in Germany when Klopstock began what Goethe, Schiller and Lessing carried into effect with the grandest perfection ever realized in modern literature. Beethoven's appearance at about the same time was no incidental coincidence among these German aspirers. The classic spirit of Greek antiquity was revived and resuscitated. Theirs was no slavish imitation of the Greeks; they like the Greeks and like Shakespeare, whom they recognized as the model and standard of dramatic poetry just as much as Sophocles, imitated nature. But they did not imitate nature in the sense of Zola and the modern naturalists of France according to whom the dirt of nature is privileged with special attention. Their imitation is an imitation of nature as a whole, as one great entirety, as a Cosmos, which in its laws is one and the same throughout. Their poetry is permeated by the same unity and unison which penetrates the universe. Thus they represent in art the Ethical law of justice which rules impartially, meting out to men the fates they shaped for themselves. And in the highest form of poetry in the tragedy, this justice bestows victory upon the idea

which is represented in its hero. The hero dies, he sacrifices his life for what is greater than himself, for his ideal. He is conquered, the individual man with his faults and imperfections perishes, but his ideal is triumphant.

The classical principles are those of monism, while romantic art is dualistic. Classic art bears the features of serene and majestic truth, of simplicity, of reality; it is lucid and intelligible. Romantic art is artificial, complex, unreal and fictitious; it is obscure, hazy and mystic. Classic art has a high purpose, its aim is holy to the artist, his art is a religion to him. Romantic art attempts to fly from this world into a beyond, it is a play of fiction, a dream. Either the artist considers art as a sport, a fictitious, unreal fancy or if he is serious, he usually is a fanatic and his poetry is not so much a religion as a superstition.

Romantic poets and artists have biased our popular views to such an extent that they succeeded to implant in the popular meaning of the word "art and poetry" the idea of romanticism, that of fictitiousness. It is for this reason that art and poetry are characterized as a 'useless and superfluous exercise of human faculties' (as Spencer says) and that it is to be compared to sport and its value measured according to its complicity. Art and poetry are so far from being superfluous and useless that they are the most important treasures of the human race, for they contain the intellectual, the spiritual and emotional wealth of human ideas, not of single thinkers but of whole nations, in a popular and harmonious form so that they can easily be communicated even to the larger, broader and less educated masses.

Goethe, Schiller and Lessing did much to enhance and advance the idea of monism. Their poetry was the bud from which the monistic philosophy was the full grown fruit.

Classicism and Romanticism are not confined to Art. Religion also is either classical or romantic; it is either based upon clear and definable principles or upon a hazy mysticism. If Religion is not in agreement with science, it is founded upon the brittle basis of superstition. If it is in contradiction to a unitary conception of the universe, it will develop that world-despising dualism whose ideal is the oppression of nature and of all that is natural in us.

Monism in the province of philosophy means conspicuous simplicity. It is the systematic and clear conception of an intelligible reality. In opposition to the diverse dualistic conceptions of the universe in their romantic, phantastic, supernatural, or mystic garbs, monism is the classical philosophy. P. C.

Such as are thy habitual thoughts, such also will be the character of thy mind; for the soul is dyed by the thoughts.

—M. Aurelius Antoninus.

## BOOK REVIEWS.

The *Writer* for July is well worthy of perusal even to those who are not practical literary workers. The magazine contains interesting gossip about authors and literary methods. It gives helpful suggestions and hints upon all matters connected with the journalistic profession. The department of "Queries" is open to correspondents, and all questions relating to literary topics are answered with accuracy and fulness. The magazine appears monthly; edited by William H. Hill and Robert Luce, P. O. Box 1905, Boston, Mass.: terms One Dollar per annum. We recommend the publication to all who wish to attain correctness and proficiency in journalistic methods.

The *Art Amateur* for July gives us a group of green ferns as its frontispiece, refreshing to the eye in comparison with the high colored pictures of the preceding months. The number is an interesting one. It contains many good designs and is especially full in instructions for painting on China Ware. The leading article is headed by a portrait of Benjamin Constant, a French artist "who is said to be best known in this country by his highly decorated canvasses of black eyed houris swathed in bright-hued fabrics of richly contrasted textures luxuriously ensconced between downy cushions in gorgeous harems, all vacuously handsome and uniformly busy in doing nothing at all." Mr. Constant looks young and healthy, and it is to be hoped when he comes to visit us next fall as is promised, he will find better subjects to paint, and put some life and thought into his work. The *Art Amateur* fights the duty on foreign pictures bravely. The artists themselves take manly ground of desiring instruction from Europe rather than protection. Grela gives an interesting sketch of a young artist who has achieved honorable success in Boston, the Bavarian Ignaz Marcus Gaugengigl. In an article on posing for a portrait is an admirable wood cut from a portrait by Ingres. The subject must have been an excellent rich bourgeois of Louis Phillipp's time. More attention is given to Landscape art in this number than is usual. The designs are very good, especially some for a set of dishes for fish, and some mouldings. The *Art Amateur* should be a welcome guest in a summer home, for it furnishes food for thought neither exciting nor exhausting, and helps in those pleasant fancy occupations better suited to the languor of summer than the brainy vigor of winter airs.

## NOTES.

*Life-Lore*, a new English monthly, has made its first appearance.

French women have started a periodical *La Revue Scientifique des Femmes*, to be edited by women only.

Mr. Carl Schurz will soon publish in the *Forum* an essay on Prince Bismarck and the influence of his politics on Europe.

The Polytechnic Society of Chicago provides free Sunday lectures on moral and intellectual topics of popular interest. The subjects will embrace the whole field of Art, Science, Music, Literature, Moral Philosophy, and Social welfare. The programme of the course says the proceedings will be made attractive by vocal and instrumental music, by pictures, and by such other refined agencies as will purify the taste, and at the same time cultivate the mind. All lectures will be free to the public. They will be delivered at 10:45 A. M. on every Sunday of July and August, and will treat successively of the following subjects: "Education," "Trees," "Life, What is it?" "Strikes and Strikers," "Success in Life and its Sources," "Demonology and Witchcraft," "The Ideal State," "Respiration." The society meets at 158 Twenty-fifth Street, corner Indiana Avenue.

Dr. Felix L. Oswald's series of essays *The Bible of Nature or the Principles of Secularism*, which appeared in *The Truth Seeker*, are now republished in book form.

Since Goethe's time Weimar has been the home of the dramatic muse in Germany. The stage of the ducal residence is unrivaled in the world for artistic performance. We are apprised of a new publication in Weimar, *Dramaturgische Blätter*, whose object will be a discussion of dramatic art.

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XIX.—Continued.

It was a long struggle between life and death, but life was victorious. Her first impression, when she awoke as from a painless slumber, was the rustling of a black dress, and the large curl of Mrs. Struvelius, who had popped her head through the closed curtains, and was gazing sorrowfully on her with her great grey eyes. She gently called her husband by name, and the next moment he was kneeling by her bed, covering her hand with kisses; and the strong man had so completely lost all self-control that he wept convulsively. She laid her hand on his head, stroked the matted hair, and said to him, gently: "Felix, my love, I will live."

There followed now a time of great weakness and slow convalescence; she had many an hour of helpless depression, but withal a faint smile would play at times over her thin, pale lips.

Spring had come. The buds had not all been destroyed by the frost of the previous night, and the birds twittered before her windows. Ilse was deeply moved to see what a good nurse her husband was,—how adroitly he gave her medicine and food, and would scarcely suffer anyone to take his place by her bedside; he stubbornly refused to take a few hours' sleep in the night, till she herself begged him to do so, and then he could not resist. She learned from Laura that he had been in great distress of mind, and when she was at the worst had been quite distracted and moody, and angry with every one. He had sat day and night by her bedside, so that it was wonderful how he had been able to endure it. "The physician was unable to manage him," said Laura; "but I found the right way, for I threatened him seriously that I would complain to you of his obstinacy. Then he consented to my taking his place for a few hours, and at last Mrs. Struvelius also, but unwillingly, because he maintained that her dress rustled too much.
